Mar. 27. London, S.W.—Three 10-ton hand cranes, for the County Council. Persons desiring to submit tenders may inspect the drawings and obtain the specifications, bills of quantities, form of tender and other particulars at the County Hall, Spring Gardens, S.W., upon payment to the Cashier of the Council of the sum of £2. Tenders must be upon the official forms, and the printed instructions contained therein must be strictly complied with. Each tender is to be delivered at the County Hall in a sealed cover, addressed to the Clerk of the London County Council, Spring Gardens, S.W., and marked "Tender for Cranes, L.C.C. Tramways," by 10 a.m. on Mar. 27.

Mar. 27. Ennistymon.—Water-supply for the towns of Ennistymon and Lahinch, co. Clare. Drawings and specification can be seen on application to the engineer, Brian E. F. Sheehy, 57, George Street, Limerick. The total cost of carrying out the scheme in accordance with the above plans and specifications is not to exceed £5,000. Sealed tenders, endorsed "Water Supply" (special form to be had from the Clerk, the Engineer or Surveyor, no other will be entertained), giving the names of two solvent sureties and a deposit of £5, must be sent to Nicholas Griffy, clerk to Council, Clerk's Office, The Workhouse, Ennistymon.

Mar. 27. Crumpsall.—Widening of bridge carrying Crumpsall Lane over the railway at Crumpsall, for the Lancashire and Yorkshire Railway. Plans can be seen and form of tender and specification obtained on application at the Engineer's Office, Hunt's Bank, Manchester. Tenders, endorsed "Tender for Widening Crumpsall Lane Bridge," to be in the hands of R. C. Irwin, secy., Hunt's Bank, Manchester, by 10 a.m. on Mar. 27.

Mar. 28. Grangemouth.—Dock extension, for the Caledonian Railway Co., as follows:—Two single-floored sheds, 400ft. and 300ft. in length respectively, and each 49ft. wide, with raised platforms, to be built on the central mole or tongue of the new dock; two-floored shed, 405ft. long by 4½ ft. wide, to be built on the north quay of the new dock; timber platform for passengers, 200ft. long by 12½ ft. wide, on the north side of the tongue; offices, latrines, urinals and other buildings; foundations and rails for crane-roads and foundations for capstans, snatch heads, &c.; forming and ballasting sidings, roads and quays, and laying permanent-way, paving, &c., on the same; supplying and laying water mains, hydrants, standpipes, &c. The contract drawings, specification and schedule of quantities may be seen at the office of the Secretary, Caledonian Railway Company, 302, Buchanan Street, Glasgow; or at the offices of Sir John Wolfe Barry, K.C.B., 21, Delahay Street, Westminster, S.W., between 10 a.m. and 4 p.m. Copies of the specification, schedule of quantities and form of tender may be obtained at either of the above offices on payment of £5 5s. Tenders, endorsed "Tender for Equipment of Dock Quays at Grangemouth," must be delivered at the office of the Secretary, Caledonian Railway Company, at or before 10 a.m. on Mar. 28.

Mar. 31. Chester.—Construction and alteration and electrical and general equipment of tramways, and new length of track in carshed. The drawings and specifications may be inspected on application to I. M. Jones, city surveyor, Town Hall, or S. E. Britton, city electrical engineer, Electricity Works, from either of whom a copy of the specification, general conditions and forms of tender may be obtained on payment of £3 3s. Sealed tenders, on the form supplied, and endorsed "Tramways," must reach J. H. Dickson, town clerk, Town Hall, Chester, by Mar. 31.

April 6. Brixham.—Water-supply: Supply, delivery and laying of about 4½ miles of 7 in. and 5 in. cast-iron water mains, together with the requisite sluice valves, air valves, meter, wash-outs, and other fittings, the construction of a service reservoir, boundary walls, meter house, and store, and other works, for the Urban D. Council. Drawings may be seen and copies of specification, bills of quantities, and forms of tender obtained at the office of the engineer, Fred. Wm. Vanstone, C.E., Palace Chambers, Paignton, on payment of £5. Sealed tenders, upon the form provided, endorsed "Brixham Waterworks," are to be addressed to Joseph L. Arlidge, clerk to the Council, Town Hall, Brixham, and delivered by April 6.

IRON AND STEEL.

Mar. 19. Bristol.—Wrought-iron and steel during the year, for the Corporation. Specification and forms of tender may be obtained at the City Engineer's Office, 63, Queen Square, on payment of 10s. Sample bars must be delivered at 63, Queen Square, by 10 a.m. on Mar. 13, and tenders must be sent in the envelopes provided to the same address by 1 p.m. on Mar. 19.

Mar. 19. Eyemouth.—Providing and laying about 1½ miles of 5 ins. and 4 ins. diameter cast-iron pipes, and for relative works. Specifications and schedules may be obtained from the engineers, Middleton, Hunter & Duff, 42, Frederick Street, Edinburgh, on deposit of £1. Sealed offers, endorsed "Eymouth Water," must be delivered to Charles Ewart, town clerk, Eyemouth, not later than the first post on Mar. 19.

Mar. 21. Bootle.—Wrought-iron railings and gates to enclose the south recreation ground and tennis and cricket grounds, for the Corporation. Plans, section and specification may be seen and quantities obtained at the office of B. J. Wolfenden, A.M.I.C.E., borough engineer. Tenders, sealed and endorsed "Tender for Railings, South Recreation Ground, Contract No. 2," to be addressed to the Parks and Baths Committee, and delivered at the Town Clerk's Office by 9 a.m. on Mar. 21.

Mar. 26. Ross.—Iron railing to be fixed on steps leading from Wye Street to the Dock, for the Rural D. Council. Plan and specification may be seen at the Council Offices. Tenders, endorsed "Iron Railing," to be delivered to Ernest R. Davies, solicitor, clerk, Council Offices, Albion Chambers, Ross, by noon on Mar. 26.

No date. Leeds.—Supplying and fixing about 600 yds. of wrought-iron unclimbable fencing and one pair of gates at East End Park; also five wrought-iron hand-gates for other grounds. For full particulars apply to Parks Superintendent, Municipal Buildings, Leeds.

PAINTING AND PLUMBING.

Mar. 16. Ipswich.—Repairing and painting the shelters, lavatories, &c., at Christchurch Park. Specification and form of tender can be obtained on application at the Borough Surveyor's Office, Town Hall, Ipswich. Tenders to be endorsed "Christchurch Park," and delivered at the Borough Surveyor's Office on or before 11 a.m. on Mar. 16.

Mar. 17. Beverley.—Painting the outside of the police-stations at Cottingham, Escrick, Filey, Hessle and Norton. Specifications may be seen and forms of tender obtained at the above stations, or upon application to the County Surveyor, Beverley. Tenders to be forwarded to J. Bickersteth, clerk to the Standing Joint Committee, County Hall, Beverley, by Mar. 17.

Mar. 19. Ross.—Bathroom at The Coppice, Bishopswood, Ross, for Sir George Bullough. Plan and specification, prepared by Arthur H. Pearson, architect, Ross, can be seen at the Post-office, Bishopswood. Tenders, endorsed "The Coppice," to be delivered at the Architect's Offices not later than noon, on Mar. 19.

Mar. 19. London, W.—Painting, colouring and other works, for the Guardians of the Poor of the Parish of

St. Marylebone, at their Infirmary, Rackham Street, Notting Hill, W. Persons desiring to tender may obtain specifications and forms of tender upon application to the Steward of the Infirmary any day up to Saturday, Mar. 17, between 10 and 12. Tenders, to be sealed and endorsed "Tender for Painting, &c., Infirmary," and delivered at the Guardians' Offices, at Northumberland Street, W., by 10 a.m. on Mar. 19.

Mar. 20. Sheffield.—Painting, whitewashing, colour-washing, &c., at the hospital at Swallowness. The matron will furnish information as to what is required, and may be interviewed any weekday before 2 p.m. Tenders (endorsed "Painting") to be delivered to N. Creswick, clerk to the Committee, 9, East Parade, Sheffield, by Mar. 20.

Mar. 21. London, E.C.—Cleaning and painting works at the Brook Hospital, Shooters Hill, Woolwich, and the South-Eastern Hospital, New Cross, S.E., for the Metropolitan Asylums Board, in accordance with specification prepared by W. T. Hatch, M.I.C.E., M.I.M.E., engineer-in-chief. Specification, condition of contract and form of tender for each work may be inspected at the office of the Board, Embankment, E.C., upon deposit of £1 each. Tenders must be delivered at the office of the Board not later than 10 a.m. on Mar. 21.

Mar. 22. Cowdenheath.—Painterwork at Guthrie U.F. Church. Schedules of quantities may be had and other information obtained on application to T. Hyslop Ure, architect, 43, Carnegie Street, Dunfermline. Tenders, marked "Painter Work, Guthrie U.F. Church," to be lodged with the architect by 10 a.m. on Mar. 22.

No date. Leeds.—Painting seven houses in Headingley, Leeds. Apply A. Walker & Son, Ltd., concrete contractors, 14, King Street, Leeds.

ROADS AND CARTAGE.

Mar. 15. Chester-le-Street.—Materials and carting, for the Rural D. Council, as follows:—Hand and machine, broken whinstone and limestone, and machine broken blast-furnace slag; and carting of same from the various stations on to the roads, for the year ending Mar. 31, 1907. Forms of tender, with specifications, quantities and other particulars, may be obtained from G. W. Aytton, Highways Surveyor's Office, Chester-le-Street, to whom tenders, endorsed "Tender for Road Metal," accompanied by properly labelled samples showing quality and size undertaken to be supplied, or "Tender for Carting," are to be delivered by Mar. 15.

Mar. 15. Escrick.—Cartage of road material, for the Rural D. Council. The work may be done by either traction engine or horse cartage, and the contractor may tender for the whole district or for one or more parishes. The contractor must state price per day and also price per ton. Forms of tender and all other information may be obtained from the councillor of any parish in the district; from the surveyor, H. Leckenby, Dunnington, York, or the Clerk. All tenders, endorsed "Tender for Cartage," to be sent to Frederick A. Camidge, clerk to the Council, 3, Stangate, York, by Mar. 15.

Mar. 15. Warmley.—Road stone, for the Rural D. Council. Particulars of the requirements of the Council and tender forms can be obtained of the Clerk. Sealed tenders, endorsed "Stone Tender," together with samples of stone, to be delivered to Seymour Williams, clerk to the Council, Council Offices, Warmley, Bristol, by Mar. 15.

Mar. 16. Chesterton.—Carting materials in the district for twelve months, from Lady Day for the Rural D. Council. Forms of tender, or information respecting the same, may be had upon application to the surveyor, J. Dunn, Brunswick House, Cambridge. Persons willing to contract are requested to send their tenders (sealed up) to John F. Symonds, clerk, 9, Bene't Street, Cambridge, by 6 p.m. on Mar. 16.

Mar. 16. Altrincham.—Supply of the following materials for the Urban D. Council:—Concrete flags, macadam and granite chippings and limestone chippings. Forms of tender may be obtained on application to the surveyor. Sealed tenders to be sent in, addressed to the Chairman of the Highways Committee, Town Hall, Altrincham, endorsed "Tender for —," by Mar. 16.

Mar. 16. Newark.—Road materials, for the Rural D. Council, as follows:—800 tons of granite and 2,000 tons of slag, to be delivered in such quantities and at such times and places in their district as the Council or their district surveyor shall require and direct. Further particulars may be obtained upon application to the district surveyor, R. Oakden junr., Winthelsea Avenue, Newark. Sealed tenders, marked "Tender for Road Material," together with samples, must be delivered free of expense at the Boardroom, The Ossington, Newark, on Mar. 19.

Mar. 15. Staines.—Granite for one year, for the Urban D. Council. Particulars and forms of tender may be obtained from E. J. Barrett, A.M.I.C.E., engineer and surveyor, Town Hall Staines, to whom tenders, endorsed "Tender for Granite," and sample of the material quoted for, are to be sent by Mar. 16.

Mar. 16. St. Austell.—For the following work, for the Urban D. Council:—Building walls, erecting iron railings, draining, metalling, kerbing, channelling and making-up new road from High Cross Street to East Hill. Plans and specifications may be seen and all information obtained on application to J. Samble, surveyor, Truro Road. Tenders, endorsed "Tender for Road," are to be sent to H. W. Higman, clerk, Urban D. Council Offices, St. Austell, by Mar. 16.

Mar. 17. Skipton.—Stone and team labour for one year, for the Urban D. Council. Specifications and forms of tender may be obtained from John Mallinson, surveyor, Town Hall, Skipton, and sealed tenders, endorsed "Tender for —" (as the case may be), are to be sent to him by Mar. 17.

Mar. 17. Selby.—Road material for the Rural D. Council. Forms of tender may be obtained from and must be delivered marked "Tenders for Materials," to E. Townend, clerk, Council Offices, 1, Abbey Place, Selby, by Mar. 17.

(Continued on p. xxii.)

THE TIMBER TRADE.

London Market in February.

FEBRUARY was a very quiet month for the London wood market. The deliveries from the docks show a further reduction of about 2,300 standards from those of February last year, and there has also been a reduction of about 500 standards in the overside deliveries, so that notwithstanding the smallness of the stock, which may now be estimated at about 23,000 standards less than last year, there is very little consolation to be gleaned from the figures. Messrs. Churchill & Sim report that prices have been quietly steady; a little dull for foreign deals and battens, a little better for pine and spruce deals, and without much tendency one way or the other for prepared boards. The month's trade in supplies for the coming season from abroad was a satisfactory one all round. There is no change to report in prices, but large further progress has been made in the reduction of the quantities available on the stock notes, and the position generally is a good deal more assured than it was a month ago. At the commencement of the selling season prices were strained a little higher than was altogether wise, and there was an undoubted risk that it might not be possible to maintain them, but during February that risk to a great extent passed away, and it is now fairly certain that there need be no break in general prices this year. Even for common redwood deals, which are still the difficulty of the situation, nothing worse would seem necessary than the possibility of having to face a large sale or two of them by themselves at the end of the season at some moderate reduction, or holding a proportion of them over for another year. Freights are fairly plentiful, but the improvement in general trade tends to keep rates something over the lowest of last year.

The abstract of dock stock, consumption, &c., for February, published by Messrs. Foy, Morgan & Co., is given in the table at the foot of this page.

Dock Stock.

The stock of wood in the public docks on February 28th was:—

Foreign deals and ends	-	-	1,200,000
Do. battens	-	-	2,127,000
Pine deals and battens	-	-	786,000
Spruce do. do.	-	-	695,000
Boards, rough	-	-	3,508,000
Do. prepared	-	-	5,972,000
totalling 14,288,000 pieces, as against			
17,269,000 in 1905, 20,449,000 in 1904, and			
17,476,000 in 1903.			

In other kinds the stock was as follows:—

Foreign wainscot logs	-	-	148 pieces.
Do. oak timber	-	-	323 loads.
Do. fir timber	-	-	1,924 do.
Do. Oregon pine, &c., spars	-	-	
and masts	-	-	5,051 do.
Colonial oak timber	-	-	1,366 do.
Do. birch timber and planks	-	-	3,685 do.
Do. elm and ash timber	-	-	781 do.
Do. yellow pine	-	-	317 do.
Do. red pine	-	-	64 do.
United States pitch-pine timber	-	-	12,469 do.
Do. do. deals	-	-	23,000 pieces.
East India teak	-	-	7,306 loads.

Deliveries.

The deliveries for the first two months have been of—

Foreign deals and ends	-	-	568,000
Do. battens	-	-	856,000

Pine deals and battens	-	-	159,000
Spruce do. do.	-	-	174,000
Boards, rough	-	-	897,000
Do. prepared	-	-	2,177,000
totalling 4,831,000 pieces, as against			
5,422,000 in 1905, 5,835,000 in 1904, and			
6,923,000 in 1903.			

The deliveries for February were—

Foreign deals and ends	-	-	284,000
Do. battens	-	-	428,000
Pine deals and battens	-	-	88,000
Spruce do. do.	-	-	91,000
Boards, rough	-	-	453,000
Do. prepared	-	-	1,073,000
totalling 2,417,000 pieces, as against			
2,849,000 in 1905, 3,059,000 in 1904, and			
3,605,000 for 1903.			

The deliveries direct from ship to craft for the first two months of the year have been—

	P.s.h.	1905.	P.s.h.	1904.	1903.
Deals and battens	4,910	3,431	3,957	2,591	
Boards	1,347	1,292	916	1,438	
Total	6,257	4,723	4,873	4,029	

and for February—

	P.s.h.	P.s.h.	P.s.h.	P.s.h.
Deals and battens	1,678	1,797	1,325	661
Boards	473	898	514	759
Total	2,151	2,695	1,839	1,420

Soft Woods.

Swedish Deals and Battens.—The demand in London was dull throughout the month, and it has been difficult to maintain in practice the prices for deals and battens theoretically so amply justified by the situation outside the market. For prepared boards the demand has been brisker, and the quotations given in January have been easily adhered to.

Norwegian Boards.—The fresh arrivals have been on a small scale, and there has been no change in the price of prepared boards. The market is firm and the stock is running comparatively low.

Russian Deals and Battens.—There is practically no change to report in this market during February. Prices have remained round about previous levels, but it has not been quite easy to keep them there in the absence of adequate local demand.

Finnish Battens.—Prices have been maintained for the small stock of Finnish battens in London in sympathy with the prospects ahead, but the month's trade was a very small one in volume.

Prussian Timber.—The market for fir timber has been quite firm, but without any further rise in prices so far as London is concerned. For oak timber there has been a better demand, and prices definitely improved here during February.

Canadian Timber.—The pine deal market in London has been quite active, and the dock stock is changing hands much more freely than for a long time past. Prices, too, have improved to within measurable distance of shippers' ideas of value. For spruce deals also prices improved during February, following a further rise in prices for arrival, which again checks business ahead. Birch has been the most easily saleable of the hardwoods at some little improvement in rates. For oak there is no change to report. Elm, ash and yellow-pine timber have been neglected. The arrival of sawn timber during the month was quite small, and this

market has of necessity dragged up again. Prices ahead are higher than ever; the demand has been good and the stock here is vanishing far too quickly. Some Oregon timber has been brought to the test of auction sale during the month and has sold cheaply—10s. per load below the London market price for pitch-pine and nearly 20s. below the cost of pitch pine for arrival. There was a fair arrival of planks during the month. The market price for them is improving.

Hardwoods.

Teak.—Messrs. C. Leary & Co. report that the East Indian teak market suffered during almost all of February from a distinct want of keenness on the part of buyers, but sellers are under no necessity to force sales and are consequently still able to command the extreme prices recently paid.

Messrs. Denny, Mott & Dickson, Ltd., report that the landings in the docks in London during February consisted of 874 loads of logs and 634 loads of planks and scantlings, or a total of 1,508 loads, as against 1,755 loads for the corresponding month of last year. The deliveries into consumption were 327 loads of logs and 345 loads of planks and scantlings—together 672 loads, as against 1,769 loads for February, 1905. The welcome feature in the figures is the maintenance of the better supplies which commenced during January. It must, however, be recognized that whilst an appreciable portion of both the logs and planks consist of Java wood, the quality of some of the shipments from Burmah leaves something to be desired, and the dock stocks of first-class quality and specification are still very inadequate—although the unprecedentedly high prices now ruling naturally restrict the demand. It is, however, increasingly clear that first-class teak must be highly paid for all this year, the only alternative being the taking of second-class wood at a lower price, which, if a dangerous, is perhaps a necessary experiment in the present state of abnormally short supplies of good wood both in Burmah and Siam.

Mahogany.—Considerable quantities of wood have been disposed of at auction during the past fortnight, and as the fresh arrivals have been of negligible proportions the nett result is a noticeable depletion of the already moderate stocks; a hardening of prices all round seems probable in the near future.

The Royal Academy Travelling Studentship for Architectural Students will this year be for the design of a town church.

Scottish Gardens and Garden Architecture.—A paper on this subject was read before last week's meeting of the Edinburgh Architectural Association by Mr. R. S. Lorimer, A.R.S.A. A historical account was given of some of the principal gardens in Scotland, Balcaskie in Fife being instanced as the ideal of what a Scottish country gentleman's garden ought to be. It was a fine specimen of a terrace garden. The lecture was illustrated by a series of lantern slides, which showed some of the gardens of Scotland and their sculpture and architectural setting, and another series illustrating some foreign—French and Italian—garden sculpture.

ABSTRACT OF STOCK, CONSUMPTION, &c., IN LONDON DOCKS, FOR FEBRUARY.

S.C. Dks. and M. Dks.	Deals (Fir).	Battens (Fir).	Pine.	Spruce.	Pitch-pine Deals.	Deals and Battens in Aggregate.	Rough Boards (All Countries).	Flooring.	Floated Timber.

Tenders.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, Great New Street, Fetter Lane, E.C. Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Beckenham.—For the erection of a private residence at Hayes Lane, Beckenham. Mr. G. St. Pierre Harris, architect and surveyor, 8, Ironmonger Lane, E.C., and Orpington, Kent:—

T. Graham	£4,668
Perry Brothers	4,404
T. Crossley & Son	4,386
Hudson Brothers	4,330
J. E. Arnold & Son	4,284
J. Duthoit	4,197
Somerford & Son	4,190
T. W. Grady*	4,155

* Accepted subject to modification.

Brighton.—For the erection of Elm Grove mixed school, Wellington Street, for the Education Committee:—

Kenworthy Brothers, Caterham Valley	£4,880	3	11
Rowland Brothers, Horsham	3,739	0	0
W. A. Field & Co.	3,630	0	0
G. Longden & Sons, Sheffield	3,568	14	8
J. Longley & Co., Crawley	3,568	0	0
Sattin & Evershed	3,542	0	0
H. J. Penfold	3,447	0	0
G. Lynn & Sons	3,429	0	0
G. R. Lockyer	3,290	0	0
F. & G. Foster, Norwood Junction	3,234	0	0
Norman & Burt, Burgess Hill	3,208	0	0
J. Barnes & Sons	3,200	0	0
R. Cook & Sons*	3,186	0	0
W. H. Hyde, Norwood Junction	2,952	0	0

* Accepted. [Rest of Brighton.]

Bristol.—For the erection of a Baptist mission hall at Freeland Buildings, Eastville, Bristol. Mr. B. Wakefield, architect, 45, Nicholas Street, Bristol:—

W. Townsend	£1,377	0	0
W. & J. Hurford	1,351	9	0
R. F. Ridd	1,337	0	0
H. W. & E. J. Neale	1,295	0	0
S. Farr	1,288	17	6
W. E. Carey, Portishead	1,242	0	0
E. J. Stock, Blagdon	1,200	0	0
A. Dowling*	1,194	0	0

* Accepted. [Rest of Bristol.]

Cheltenham.—For Naunton Park Schools, Cheltenham. Messrs. Chatters & Smithson, architects, Cheltenham:—

W. T. Bloxham, Banbury	£15,797
Pethick Brothers, Plymouth	15,744
Wilkins & Son, Bristol	15,235
J. Gutteridge, Peterborough	15,200
Lane & Son, Wolverhampton	14,969
Long & Sons, Bath	14,930
H. Smith, Kidderminster	14,633
E. Walters & Sons, Bristol	14,500
R. Skemp, Cheltenham	14,475
Estcourt & Son, Gloucester	14,440
Channon & Son, Cheltenham	14,250
Billings & Sons, Cheltenham	14,157
W. Jones, Gloucester	14,100
L. Jones, Wolverhampton	13,998
Bowers & Co., Hereford	13,985
Parnell & Son, Rugby	13,969
Dallow & Sons, Birmingham	13,725
Collins & Godfrey, Tewkesbury	13,477
T. Cuthbert, Nottingham	13,150
C. Moss, Loughborough	11,088
Eastwood, Kettering	12,855
C. Wright, Leicester	12,777

(Continued from p. 149.)

Mar. 17. Knutsford.—Supply of the following materials, for the Bucklow Rural D. Council:—Blue Welsh Pennmaenmawr setts, small stones, chippings, limestone chippings, edging stones, socket glazed pipes, grit setts, hand-broken Welsh Pennmaenmawr stones, road grids, spades, shovels, road brushes, copper slag, cinders and for paving, from April 1, 1906, to Mar. 31, 1907. Further information and forms of tender may be obtained of Joseph Burgess, Tabley, Knutsford. Tenders, with samples, must reach George Leith, clerk to the said Council, Union Offices, Knutsford, by 10 a.m. on Mar. 17.

Mar. 17. Southwell.—Casting road material for one year, for the Rural D. Council. Forms of tender, with estimated quantities of material, may be obtained for the parishes forming the south portion of the Council from Henry Morris, highway surveyor, Southwell, Notts, and for the north portion of the Council from Richard Woolhouse, highway surveyor, Causton, Newark. Tenders must be sent to G. E. Kirkland, clerk to the Council, Southwell, by Mar. 17.

Mar. 19. Pontefract.—Road material, for the repair of the highways for the year ending Mar. 31, 1907. Forms of tender will be furnished on application to J. Dickon Smith, clerk, Union Offices, Pontefract, to whom tenders must be sent or delivered, together with sample of the material, by Mar. 19.

Mar. 19. Wing.—Supply of the following materials, for the Rural D. Council:—750 tons of granite, and 1,800 tons s'ag, sand and gravel, at the various stations and wharves in the district (including unloading and all wharfage charges), to be delivered as required. Tender forms may be obtained from the surveyor, M. G. Curney, Leighton Buzzard, and must be forwarded with samples, and endorsed "Tenders for Materials," to C. W. B. Calcutt, clerk of the Council, Leighton Buzzard, by Mar. 19.

Mar. 19. Sulcoates.—Whinstone, granite and gravel, for the year ending Mar. 31, 1907, for the Rural D. Council. Particulars and forms of tender may be obtained from the Council's surveyor, A. Greaves, Woodbine Villa, Hessele. Tenders, endorsed "Stone," must be delivered to Charles W. Dunkerly, solicitor and clerk to the Council, 7, Land of Green Ginger, Hull, by Mar. 19.

Mar. 19. Wellingborough.—Granite, for the Rural D. Council. Forms of tender may be had of the Clerk of the Council, and no tender will be received which is not on such form. Tenders, with specimens of stone, must be sent to the Workhouse at Wellingborough by Mar. 19.

Mar. 20. Maidstone.—Supply of road materials &c., for the Urban D. Council. Specifications, forms of tenders and all other information may be obtained on application at the office of the borough surveyor, T. F. Bunting, at the Fair Meadow, Maidstone. Sealed tenders, which will only be received on the forms supplied, endorsed "Tender for the supply of ——" must be delivered at the Town Clerk's Office by Mar. 20.

Mar. 20. Leek.—Supply of the following materials, for the Urban D. Council, for the year ending Mar. 31, 1907:—2½ in. and 3 in. flags, 4½ in. and 2 in. kerbs, 4 in., 5 in. and 6 in. grit setts, Portland cement, blue lias lime, macadam stone, cast-iron manhole step iron, manhole covers, lampole covers, bass rooms, cast-iron frames and grids. Specification and form of tender may be obtained upon application to W. E. Beacham, C.E., surveyor and water engineer, Town Hall, Leek. Sealed tenders, endorsed "Materials," to be delivered at the Town Hall, Leek, not later than noon on Mar. 20.

Mar. 20. Prescott.—Carting, for the Urban D. Council, for a term of three years ending Mar. 31, 1909. Forms of tender may be obtained from Richard Norris, surveyor, Bank Buildings, Prescott. Sealed tenders, endorsed "Carting," to be sent to Henry Cross, clerk to the Council, 2, Derby Street, Prescott, by Mar. 20.

Mar. 20. Gretton.—About 915 tons of broken granite and screenings, on or before Dec. 1, to be delivered (carriage free) at the following stations, viz., Corby and Weldon, Gretton, Fineshade Siding, Harringworth, Rockingham and Wakerley, at such times and in such quantities as the Surveyor of the Council shall from time to time order. Printed forms of tender and specifications, containing full particulars, may be obtained on application to the Clerk. Tenders, marked "Granite Tender, Gretton," and samples to be delivered to Frederick Oakley, clerk, Council Offices, Uppingham, 10 a.m. on Mar. 20.

Mar. 20. Gretton.—Carting about 915 tons of granite from the stations of Corby and Weldon, Gretton, Fineshade Siding, Harringworth, Rockingham and Wakerley to the various highways in the district, at such times, to such places and in such quantities as the Surveyor of the Rural D. Council shall require and direct. Forms of tender, showing the quantity of material for each parish and the station from which it is to be carted, may be obtained on application to the Clerk. Tenders are to be marked on the cover "Team Labour, Gretton," and sent to Frederick Oakley, clerk, Council Offices, Uppingham, by 10 a.m. on Mar. 20.

Mar. 20. Uppingham.—About 3,500 tons of broken granite and screenings, on or before Dec. 1 next, to be delivered (carriage free) at the following stations:—Uppingham, Rockingham, Seaton, Luffenham, Wakerley, Manton, East Norton and Morcott, at such times and in such quantities as the Surveyor of the Council shall from time to time order. Printed forms of tender and specifications, containing full particulars, may be obtained on application to the Clerk. Tenders, marked "Granite Tender, Uppingham," to be sent to Frederick Oakley, clerk, Council Offices, Uppingham, by Mar. 20.

Mar. 20. Uppingham.—Carting about 3,500 tons of granite from the stations of Uppingham, Rockingham, Seaton, Luffenham, Wakerley, Manton, East Norton and Morcott to the various highways in the district, at such times, to such places and in such quantities as the Surveyor of the Council shall require and direct. Forms of tender, showing the quantity of materials for each parish and the station from which it is to be carted may be obtained on application to the Clerk. Tenders are to be marked on the cover "Team Labour, Uppingham," and sent to Frederick Oakley, clerk, Council Offices, Uppingham, by 10 a.m. on Mar. 20.

Mar. 21. Hereford.—Hauling for the year, for the Rural D. Council, the particulars of which, with forms of tender, can be obtained from H. F. Froggatt, surveyor, Whitecross Road, Hereford, or H. Bishop, surveyor, Moreton-on-Lugg, Hereford. Tenders, endorsed on the outside "Highway Tenders," to be sent to R. Moore, clerk, Hereford, by Mar. 21.

Mar. 21. Brighton.—Supply of dressed granite kerb and channel, as under:—5,000 ft. run 2 in. by 6 in. granite flat kerb, 6,000 ft. run 2 in. by 6 in. granite flat channel. Specification and form of tender may be obtained on application at the office of the Borough Surveyor, at the Town Hall, Brighton. Sealed tenders, endorsed "Tender for Granite Kerb," must be addressed to Hugo Talbot, town clerk, Town Hall, Brighton, by 10 a.m. on Mar. 21.

Mar. 21. Elham.—Supply and delivery of stone for the Rural D. Council, in the under-mentioned parishes:—Elham, 260 cub. yds. of flint; Elham, 100 cub. yds. of (broken) rock; Hawkinge, 600 cub. yds. of flint; Lyminge, 300 cub. yds. of flint; Lyminge, 40 cub. yds. of (broken) rock; Lympe, 300 cub. yds. flint; Lympe, 20 cub. yds. beach; Monkshorton, 140 cub. yds. of flint; Newington, 100 cub. yds. of flint; Paddlesworth, 80 cub. yds. of flint; Postling, 160 cub. yds. of flint; Saltwood, 360 cub. yds. of flint; Sellenge, 120 cub. yds. of flint; Stanford, 80 cub. yds. of flint; Stowting, 200 cub. yds. of flint; Swingfield, 80 cub. yds. of flint. Particulars and forms of tender may be obtained from A. Hambrook, surveyor, Lyminge, Kent. All tenders (which must be on the printed forms supplied) must be sent to Mr. Loneragan, 11, Cheriton Place, Folkestone, by Mar. 21.

Mar. 21. London, W.—Formation of a new road and laying pipe sewers on the Gunnersbury Estate, Bollo Lane, Chiswick, W. Plans and specification can be seen and further particulars obtained upon application at the office of Nowell Parr & A. E. Kates, surveyors, Brunswick House, Brentford, and sealed tenders, endorsed "Tender for New Road," to be delivered to Bolton & Co., solicitors, 3, Temple Gardens, Temple, E.C., by noon on Mar. 21.

Mar. 21. Clayton-le-Moors.—Sewering, levelling, paving, channelling and making good nine front streets and nine back streets, for the Urban D. Council. Plans may be seen and specifications, quantities and forms of tender may be obtained (on payment of £1 rs.) on application to Arthur Dodgeon, surveyor to the Council. Also the construction of a short length of brick culvert at Super Tip. Specifications may be seen and form of tender and further particulars obtained on application to the Surveyor of the Council. Sealed tenders, endorsed "Street Works," or "Culvert," as the case may be, to be delivered to James Smith, clerk to the Council, Urban D. Council Offices, Clayton-le-Moors, by noon on Mar. 21.

Mar. 21. Twickenham.—Forming, levelling, kerbing, channelling, paving, metalling and making good Southfield Gardens, Grove Avenue and Athelstan Road. Plans can be seen and specifications and forms of tender obtained on application to F. W. Pearce, surveyor to the Council, Town Hall, Twickenham. No tender will be accepted unless made on the prescribed form. Sealed tenders, endorsed with the name of the street and marked "Tender for Street Improvement Works," to be delivered to H. Jason Saunders, clerk to the Council, Town Hall, Twickenham, by noon on Mar. 21.

Mar. 22. Eastry.—Flints, and re-casting stones from depôts for the Rural D. Council. Tenders are also invited for steam-rolling with 10 ton rollers for the Rural D. Council. Forms of tenders and schedules of quantities may be obtained of the district surveyor, D. E. Foster, Hazel Bank, Eastry, Dover, or the assistant surveyor, W. Goodsell, Durlock Road, Ash, Dover. Sealed tenders, endorsed "Tender for Road Material," "Tender for Carting," and "Tender for Steam-rolling," addressed to the Eastry Rural D. Council, must be delivered at the clerk's office, Workhouse, Eastry, near Dover, by Mar. 22.

Mar. 22. Luton.—Road materials in accordance with the specifications prepared by the borough surveyor, S. F. L. Fox, A.M.I.C.E., Town Hall, Luton. Tenders, accompanied by samples and endorsed "Road Materials," must reach George Sell, town clerk, Town Hall, Luton, by 4 p.m. on Mar. 22.

Mar. 22. Farsley.—550 tons of 4 in. by 5 in. granite setts, specially dressed to admit of a close joint, delivered at Stanningley Station. Also for 650 lineal yds. 12 in. by 8 in. (8 in. face up) York stone kerb. Further particulars can be obtained from C. H. Wright, surveyor, Farsley, to whom samples and prices endorsed "Setts" or "Kerb" must be delivered by Mar. 22.

Mar. 24. Driffield.—Road material for the Rural D. Council, as follows:—About 6,000 tons of whinstone, 1,000 tons of slag, 900 tons of sea cobbles, 500 tons of sea gravel, 200 tons of tarred chips. Particulars and forms of tender can be obtained on application to T. Casson Beaumont, C.E., surveyor, Driffield, to whom tenders, endorsed "Tender for Materials," are to be sent by Mar. 24.

Mar. 24. Axbridge.—Road steam-rolling and scarifying, for the Rural D. Council. This work necessitates four rollers and two scarifiers for about ten months in the year. Further particulars, together with forms of tender, can be obtained from George A. Millard, district surveyor, Cheddar. Tenders, endorsed "Steam Rolling," to be sent to William Reece, clerk to the Council, Council Offices, Axbridge, R.S.O., Somerset, by Mar. 24.

Mar. 24. Levenshulme.—Draining, paving, curbing, flagging, channelling and completing Henderson Street Extension and Nall Street, for the Urban D. Council. Specifications, bills of quantities and further particulars may be obtained from the Council's surveyor, James Jepson, Guardian Chambers, Tiviot Dale, Stockport, on payment of £1 rs. Tenders, endorsed "Tender for Private Street Works," to be sealed and delivered to J. Ogden Hardicker, clerk to the Council, Northern Assurance Buildings, Albert Square, Manchester, by Mar. 24.

Mar. 24. Saffron Walden.—Haulage by team or steam for the year commencing Mar. 31, on the district council roads. Full particulars and specifications may

be obtained from Henry Smith, surveyor, Saffron Walden. Tenders, endorsed "Tenders for Haulage," to be sent to W. Adams, deputy clerk to the Council, Saffron Walden, by Mar. 24.

Mar. 24. Repton.—Road materials and cartage, for the Rural D. Council. Printed forms of tender, containing full particulars, may be obtained from T. R. Sidwick, surveyor of highways, Repton, Burton-on-Trent; and all tenders must be on the printed forms supplied, and properly filled in, and sent to C. F. Chamberlin, clerk, Union Offices, Burton-on-Trent, by Mar. 24.

Mar. 27. Deptford.—Making-up and paving portions of Avignoa Road, Musgrove Road, Yeoman Street and Whitecher Street, all within the borough, and for the execution of other works in connection therewith, in accordance with the specifications and plans to be seen at the Borough Surveyor's Office, Town Hall, New Cross Road, S.E., between 10 and 4 (Saturdays 10 and 12). Sealed tenders (which must be on forms to be obtained from the Town Clerk) must be delivered, in accordance with the Council's regulations printed on the form of tender, at the Town Hall not later than 4 p.m. on Mar. 27.

Mar. 27. Malling.—1,800 cub. yds. of quartzite, basalt or granite, for the Rural D. Council. Full particulars and forms of tender, with terms of contract, may be obtained of John Marshall, surveyor, West Malling, Sealed tenders, endorsed "Tender for Road Materials," to be delivered to Frederick J. Allison, clerk, Council Offices, West Malling, Kent, by Mar. 27.

Mar. 27. London, W.—Making-up the following roads for the Ealing Town Council:—Coldershaw Road (portion), Fordhook Avenue (first portion), Hillcroft Crescent (second portion), Queen's Road and Sunderland Road. Drawings and specification may be seen and form of tender, together with schedule of quantities and other particulars, obtained from Charles Jones, M.I.C.E., borough engineer, Town Hall, Ealing, W., any day during office hours, upon payment of a deposit of 10s. 6d. for each road. Sealed tenders, in the envelopes provided, endorsed "Tender for Making-up ——" must be delivered at the Town Clerk's Office by the first post on Mar. 27.

Mar. 29. Normanton.—Supply of the following materials, for the twelve months commencing April 1, 1905:—Concrete flags, stone flags, kerbs, channels, stone setts, granite and limestone road material. Conditions, specifications and forms of tender can be obtained from A. Hartley, consulting surveyor, Council Chambers, Castleford. Tenders to be sent to C. B. L. Fernandes, clerk, Council Offices, Normanton, by Mar. 29.

Mar. 29. Sale.—Private street works. Paving and making good of the following passages, for the Urban D. Council:—Rear Eliza Street and Mason Street; rear Symons, Manor, Linley and Sefton Roads; rear 82 to 96, Cross Street; rear 7 to 19, Hope Road and 2 to 8, Thorn Grove; rear 2 to 30, Seymour Grove; rear 9 to 29, Northenden Road; rear 137 to 143, Northenden Road; rear Old Hall Road. General conditions, plans and specification may be seen and bills of quantities obtained at the office of William Holt, engineer and surveyor, Council Offices, Sale, on deposit of £1. Sealed tenders, endorsed "Private Street Works, Contract No. 3," to be delivered into the hands of D. Halliwell, clerk to the Council, Council Offices Sale, by 5 p.m. on Mar. 29.

April 5. Hastings.—150 to 200 tons of Rhenish basalt spalls, for the Corporation. Specification, form of tender and other information may be obtained on application at the office of the Borough Engineer P. H. Palmer, M.I.C.E., Town Hall, Hastings. Tenders, under cover, endorsed "Tender for Basalt," to be delivered to Ben. F. Meadows, town clerk, Town Hall, Hastings, by noon on April 5.

April 4. Tenterden.—Supply of the following materials, for the Corporation:—Cherbourg quartzite, basalt or other approved material, flints and ragstone. Also for the carriage of the above. Further particulars and forms of tender may be obtained of W. L. C. Turner, borough surveyor, Town Hall, Tenterden, to whom samples should be sent. Tenders to be sent to J. Munn Mace, town clerk, Tenterden, Kent, by April 14.

SANITARY.

Mar. 15. Bridge.—Scavenging the under-mentioned parishes for twelve months from April 1 to Mar. 31, 1907:—Barham, Bridge, Chatham, Littlebourne, and Petham. The Council finds sanitary carts and appliances, and the contractors are to provide sheds for their protection. Full particulars can be obtained from the Sanitary Inspector, Bridge, Canterbury. Sealed tenders, marked "Tender for Scavenging," must be delivered to T. Louis Collard, clerk, Bridge, by 10 a.m. on Mar. 15.

Mar. 16. Barnstaple.—Construction of a sewer in the parish of Fremington (from North Lane to the Main Road, and from the end of North Lane to the end of Hobb's Lane), for the Rural D. Council. Plans and specification, &c., may be seen at the office of Eric G. Kingwell, building surveyor, 85, Boutport Street, Barnstaple. Tenders, to be endorsed "Sewer, Fremington," to be sent to W. Pitts Tucker, Bridge Chambers, Barnstaple, on or before Mar. 16.

Mar. 19. Southend-on-Sea.—Conveniences on the slopes of the Cliffs, for the Corporation. Plans and specification may be seen and bills of quantities obtained, on deposit of cheque for £1 rs., upon application to E. J. Elford, M.I.M.E., borough engineer. Sealed tenders, endorsed "Conveniences," to be delivered at the Town Clerk's Office before noon on Mar. 19.

Mar. 21. Stroud.—Storm-water drain, for the Rural D. Council, in accordance with specification prepared by the district surveyor, Walter Brooke, A.M.I.C.E. Specification may be seen on application to J. E. Povey, clerk to the Council, Union and Council Offices, Stroud, Kent, to whom tenders, enclosed in sealed envelopes and endorsed "Storm-water Drain—Sole Street," are to be delivered by Mar. 21.

Mar. 22. Gorton.—Providing and laying about 545 in. yds. of 24 in. pipe sewer, with manholes, for the Urban

D. Council. Plans may be seen and bills of quantities obtained at the office of C. J. Lomax, Alliance Buildings, 37, Cross Street, Manchester, by deposit of £2 2s. Tenders must be delivered to C. T. Singer, clerk to the Council, Town Hall, Gorton, by noon on Mar. 22.

Mar. 22. Guildford.—*Sewerage* of a portion of the extended area of the borough situate in the St. Nicholas Ward. The approximate length of sewers is as follows:—1,297 yds lineal g.n. stoneware pipes, 10 yds. lineal 6 in. stoneware pipes, 14 manholes and 1 flushing chamber. Plans may be seen and a specification with bill of quantities obtained on application to C. G. Mason, C.E., the borough engineer and surveyor, Tuns Gate, on payment of £3 3s. Tenders, endorsed "Tender for the Sewerage of Artington (1st section)," are to be sent to F. S. Miller, town clerk, Town Clerk's Office, Bridge Street, Guildford, by noon on Mar. 22.

Mar. 24. Chingford.—*Bacteria beds, settling tanks* and other appurtenant works, and also for the erection of pumping station, sump and hydrostatic tank, at the Urban D. Council sewage works. Plans and specifications (prepared by W. Turner Streatheir, of Waltham Abbey) can be obtained from the Council's surveyor, Walter Stair, Council Offices, Chingford, upon a deposit of £2. Tenders, endorsed "Sewage Works," to be delivered to Leonard C. Bowen, clerk to the Council, Council Offices, Station Road, Chingford, by noon on Mar. 24.

Mar. 26. Kettering.—*Sewerage and sewage-disposal works*, for the parishes of Broughton and Cransley. Plans and sections of proposed works may be seen and specifications and bills of quantities, together with a form of tender, may be obtained on application to D. J. Diver, High Street, Desborough, Northants, with remittance of £2 2s. Sealed tenders, endorsed "Tenders for Broughton & Cransley Sewerage Works," are to be delivered to Charles W. Lane, clerk to the Kettering Rural D. Council, Council Offices, George Street, Kettering, by Mar. 26.

Mar. 26. Mountain Ash.—*Laying about 400 yds. of 6 in. sewer*, and about 240 yds. 4 in. drains at Old Ynysybwll. Specification, plans and sections may be seen, and forms of tender and bills of quantities obtained, on application to the Surveyor, Town Hall, Mountain Ash. Sealed tenders, prepaid and endorsed "Old Ynysybwll," to be sent to H. P. Linton, clerk to the Council, Town Hall, Mountain Ash, by 10 a.m. on Mar. 26.

Mar. 26. Skirbeck.—*Scavenging and road watering* for the year, for the Parochial Committee. Contractor to find his own or hired horse and scavenging carts. Water cart provided. The contractor to enter into an agreement the terms of which may be seen upon application at the Clerk's Office. Tenders, marked "Tender for Scavenging, &c.," to reach J. H. Tooley, clerk 6, Bridge Street, Boston, by Mar. 26.

Mar. 25. Todmorden.—*Sewers.* Construction of 429 lin. yds. of 27 in. diam., 204 lin. yds. of 24 in. diam., 698 lin. yds. of 21 in. diam., 430 lin. yds. of 18 in. diam., 218 lin. yds. of 15 in. diam., and 277 lin. yds. of 12 in. diam. earthenware pipe sewers, and 117 yds. of cast-iron pipe sewers, of various sizes, together with all necessary manholes, lampholes, and other contingent works, to be laid in Brook Street, Market Ground and Burnley Road, for the Council. Drawings may be seen and specification, bill of quantities, and form of tender obtained at the Borough Surveyor's Drawing Office, Market Ground, upon the deposit of £1. Sealed tenders, endorsed "Tender for Burnley Road Sewer," and addressed to "The Chairman of the Health Committee," must be sent in to D. Sutcliffe, town clerk, Town Hall, Todmorden, by 9 a.m. on Mar. 26.

Mar. 26. Todmorden.—*Sewers.* Construction of 326 lin. yds. of 3 ft. g.n. diam. and 28 lin. yds. of 4 ft. 6 in. diam. cast-iron pipe sewers, and 1,752 lin. yds. of 3 ft. g.n. internal diam. brick and concrete sewer, with all necessary manholes, lampholes, and other contingent works, to be laid from Lobb Mill to Stansfield Bridge, for the Borough Council. Drawings may be seen and specification, bill of quantities, and form of tender obtained at the Borough Surveyor's Drawing Office, Market Ground, upon the deposit of £1. Sealed tenders, endorsed "Tender for Halifax Road Sewer," and addressed to "The Chairman of the Health Committee," must be sent in to D. Sutcliffe, town clerk, Town Hall, Todmorden, by 9 a.m. on Mar. 26.

Mar. 26. Tonbridge.—*Sewerage and sewage-disposal works* (Contract No. 1). Construction of about 3,400 lin. yds. of g.n. and 1,020 lin. yds. of 6 in. stoneware pipe sewer, and 950 lin. yds. of 6 in. iron pipe rising and distributing mains, together with forty manholes, sedimentation tanks, &c., in connection with the Hildenborough sewage scheme, for the Rural D. Council. Plans may be seen and specification, schedule of quantities, form of tender and other particulars may be obtained on application to Frank Harris, engineer and surveyor to the Council, Broadway, Southborough, Tunbridge Wells, upon payment of £3 3s. Sealed tenders, in envelope provided, endorsed "Hildenborough Sewage Works," to be delivered to Neville R. Stone, clerk, 23, Church Road, Tunbridge Wells, by the first post on Mar. 26.

Mar. 27. Lancaster.—*Sewerage and sewage-disposal works.* About 1,500 yds. of g.n. and 6 in. sewers, with manholes, &c., and also for the construction of grit chambers, septic tanks, contact and streaming filters, for the Rural D. Council. Plans and specifications may be seen and bills of quantities obtained at the office of J. R. Lupton, surveyor, Lancaster. Sealed tenders, and endorsed, should be sent to W. H. Ritson, clerk, Lancaster, Durham, by Mar. 27.

Mar. 27. London, W.—*New soil-sewer* in Hanger Lane, and manholes, &c., in connection therewith, for the Ealing Town Council, as under:—About 2,388 ft. of 15 in. pipe; about 1,056 ft. of 12 in. pipe; about 1,638 ft. of 9 in. pipe. Drawings and specifications may be seen, and forms of tender, together with schedule of quantities and other particulars, obtained from Charles Jones, M.I.C.E., borough engineer, Town Hall, Ealing, W., any day during office hours, upon payment of a deposit of £5 5s. Sealed tenders, in the envelope provided, endorsed "Tender for New Soil Sewer," must be delivered at the Town Clerk's Office by the first post on Mar. 27.

MISCELLANEOUS.

Mar. 10. Epsom.—*Supply of the following stores, &c., for the Urban D. Council for one year:*—Sewerage ironwork; gully gratings; shovels, picks, brooms, forks, dust sumps, &c.; disinfectants; cement and lime; stone-ware pipes and gulleys; kerbing and channelling; setts; broken granite and flints; bricks and paving. Specification and forms of tender may be obtained upon application to the Surveyor's Office, "Bromley Hurst," Church Street, Epsom. Sealed tenders, addressed to the Clerk of the Council and endorsed "Tenders for Stores," to be delivered at the Clerk's Office by noon on Mar. 19.

Mar. 16. Morley.—*Supply of the following materials for the year, for the Corporation:*—Granite, setts, flags, kerbs (Yorkshire stone), sewer and drain pipes, sand, cement, lime, cast-iron lamp pillars, manhole and ventilating covers, gully gratings and frames, pitch, creosote oil and weed brooms. Forms of tender and further particulars may be obtained on application to the Borough Engineer. Tenders, sealed and endorsed "Tender for —," to be delivered at the Town Clerk's Office, Town Hall, Morley, by Mar. 16.

Mar. 17. London, E.—*For the supply of the following stores, for the East Ham Borough Council, for the period ending Mar. 31, 1907:*—Glazed stoneware pipes; glazed stoneware gully fittings (London and country make); Portland cement; greystone and chalk limes; aluminiferous for sewage precipitation; lime for sewage precipitation; stock and other bricks; coal and coke; engineers' sundries (oils, colours, painters' brushes, &c.); hand-broken granite; crushed granite; broken flints; granite kerbs; cast ironwork, gulleys, &c.; shovels, brooms, picks and handles; disinfectants; hire of horses and carts for scavenging, dust collection, &c.; sewer ventilating columns; paving flags; timber (carpenters' and joiners' work and wheelwrights' w.r.k.). Particulars and form of tender may be obtained on application to the Town Clerk. Fair wages clause inserted. Tenders to be sent in addressed to "His Worship the Mayor of East Ham, Town Hall, East Ham, E." and endorsed according to the supply of work tendered for, by Mar. 17.

Mar. 17. Fulwood.—*Supply of the following materials, for the Urban D. Council:*—Granite macadam; carting granite from dock; earthenware pipes and junctions; iron pipes; best scavenger brushes; straight kerbs, setts and channel stones and limestone chippings. Specification and form of tender may be obtained on application from the Surveyor, Council Offices, Fulwood. Tenders, endorsed "Tender for Stores," must be sent to Arthur Brierley, clerk to the Council, Urban D. Council Offices, Garstang Road, Fulwood, by Mar. 17.

Mar. 19. Croydon.—*Supply of the following materials, for the Guardians:*—Builders' materials, deal ends and battens for firewood, electrical fittings and appliances, glass and earthenware, ironmongery. Tenders, accompanied by samples where practicable, must be addressed to the Guardians and sent to the Union Offices, Mayday Road, Thornton Heath, by 6 p.m. on Mar. 19, properly sealed and endorsed, "Tender for —," and postage and carriage free, or they will be rejected.

Mar. 19. Bacup.—*Supply of the following materials, for the Corporation:*—Flags, kerbs, channels and setts (local stone); granite macadam, granite chippings and limestone chippings; earthenware pipes, &c.; waste-water closets; bricks (red); ironmongery, tools and brushes; iron castings, &c.; covers, flags and bricks. Further particulars and forms of tender can be had on application at the Borough Surveyor's Office. Tender, under separate cover, marked with the name of the article tendered for, must be delivered to A. Blasdale Clarke, town clerk, Town Clerk's Office, Bacup, by Mar. 19.

Mar. 19. Trowbridge.—*Supply of the following materials, for the Urban D. Council:*—Hiring of horses and carts, supplying of brushes, brooms, shovels and picks, scarifying and steam-rolling. Particulars and forms of tender may be had on application to the Surveyor. Sealed tenders, properly endorsed "Horse Hire," &c., as the case may be, to be sent to H. G. Nicholson-Lalley, town surveyor, Town Hall, Trowbridge, by 2 p.m. on Mar. 19.

Mar. 20. Prescott.—*Supply of the following materials, for the Urban D. Council:*—Pipes, grids, manhole covers, gulleys, oils, disinfectants, stores, &c., for the year ending Mar. 31, 1907. Specification may be seen at the offices of Richard Norris, surveyor, Bank Buildings, Prescott. Sealed tenders, endorsed "Stores," to be sent to Henry Cross, clerk to the Council, 2, Derby Street, Prescott, by Mar. 20.

Mar. 20. Chadderton.—*Supply of the following materials, for the Urban D. Council, during the year ending Mar. 31, 1907:*—Broken granite, earthenware pipes, gulleys, &c.; setts, flags and kerbs, pitch and oil, and limestone chippings. Forms of tender may be obtained on application at the Surveyor's Office, Town Hall, Chadderton. Sealed tenders, endorsed "Tender for Materials," to be sent to Henry Hoyle, solicitor, clerk to the Council, Town Hall, Chadderton, by noon on Mar. 20.

Mar. 20. St. Helens.—*Supply of the following materials for the Corporation, for a period of twelve months:*—Concrete flags 24 in. thick; granite setts, 4 in. cube, and 6 in. by 4 in.; granite kerbs, 10 in. by 7 in. (Irish); granite channels, 10 in. by 5 in. (Irish); macadam and chippings; ironwork (manhole covers, &c.); glazed socketed stoneware pipes; scavenging brushes; carolic acid and powder. Conditions of contract, specification and form of tender can be obtained upon application to George J. C. Broom, M.I.C.E., the borough engineer, Town Hall. Tenders for any of the above materials must be sent in, upon forms supplied, not later than noon on Mar. 20, addressed to the Chairman of the Paving, &c., Committee, Town Hall, St. Helens, and endorsed "Tender for —." A sample quantity of each of the materials (except ironwork) must be forwarded, carriage paid, to the Corporation's Depot, Salisbury Street, St. Helens.

Mar. 21. Bredbury.—*Supply of the following materials, for the Bredbury and Romiley Urban D. Council:*—Grit setts, curbs, concrete and Lancashire flags, macadam, tar, creosote oil, paraffin oil, chippings,

brushes, earthenware pipes, bends and junctions, and also team and labour. Samples to be forwarded to the Surveyor, School Brow, Bredbury, from whom further particulars and forms of tender can be obtained. Sealed tenders to be delivered at the District Council Offices, School Brow, Bredbury, by noon on Mar. 21.

Mar. 21. Richmond.—*Supply of granite, ironmongery and plumber's materials to the Workhouse for twelve months from April 1, 1905, to Mar. 31, 1907.* Printed forms of tender and contract, which only can be received, containing full particulars and conditions, and estimates of quantities required, may be obtained on personal application at the Guardians' Offices, Parkshot, Richmond, Surrey, or by forwarding an addressed envelope (foolscap size) duly stamped. Tenders addressed to the Guardians, endorsed "Tender for —," and accompanied by samples of the articles tendered for, must be received at the Guardians' Offices not later than 5 p.m. on Mar. 21.

Mar. 21. Clayton-le-Moors.—*Supply of the following materials, for the Urban D. Council:*—Flags, channels, kerbs, setts and broken granite; earthenware pipes; and ironwork. Forms of tender may be obtained on application to Arthur Dudgeon, surveyor to the Council. Sealed tenders, endorsed "Tender for Materials," to be delivered to James Smith, clerk to the Council, Council Offices, Clayton-le-Moors, by noon on Mar. 21.

Mar. 23. Wrexham.—*Supply of the following materials:*—Borough Surveyor's Department: Macadam, setts, kerb and channel stones; cement and flags; lime; earthenware pipes, gulleys, chequered tiles and channels; oils, paints; tools and ironmongery; sanitary materials and disinfectants; teamwork; timber. Borough Electrical Engineer's Department: Engine-room stores; cables; joint boxes and jointing materials; double-pole service cut-outs; meters; incandescent lamps; arc lamp carbons; ironmongery; consumers' installation materials; wood troughing, &c. Forms of tender to be obtained from the Borough Surveyor and from the Borough Electrical Engineer for their respective departments. Contracts to be subject to the condition known as the fair wage and hours clause. Sealed tenders, endorsed "Tenders for —," to be addressed and sent in to Thomas Bury, town clerk, Wrexham, by Mar. 23.

Mar. 23. East Molesey.—*Supply of the following material, for the Urban D. Council:*—List 1: Cartage (daywork and piecework); limestone Derbyshire marble asphalt (supply only); Portland cement; Quenast granite; Kentish brown flints; Hungry Hill flints; Farnham fine gravel; Norway granite kerb; steam roller (hire of); granite gravel, granite dust and granite setts. List 2: Sanitary stoneware pipes; greystone lime. Specifications, particulars and forms of tender may be obtained upon application to the Surveyor, District Council Office, East Molesey. Sealed tenders for List 1, addressed to the Chairman of the Highways and Lighting Committee, and for List 2, addressed to the Chairman of the Drainage Committee, to be delivered at the District Council Office, St. Mary's Road, East Molesey, by 4 p.m. on Mar. 23.

Mar. 24. Exeter.—*Works and repairs, and the supply of such materials as may be ordered by the Guardians for their properties and the workhouse buildings, for a period of one year, from Ladyday next.* Forms of tender, with conditions of contract and schedules of prices, can be had on application to R. M. Challice, surveyor to the Guardians, 14, Bedford Circus, Exeter. Sealed tenders to be delivered to Arthur Snell, clerk to the Guardians, Exeter, by Mar. 24.

Mar. 24. Waterloo-with-Seaforth.—*Supply of the following materials for one year, for the Urban D. Council:*—Macadam and chippings; cartage of macadam, setts, &c., from the North Docks. Liverpool; horse hire; Hasting len or Yorkshire flags, setts, kerbs, channels and crossing stones; granite crossing stones; concrete flags; Portland cement; pitch and tar; lamp columns; sewer ventilators and manhole covers; cast-iron ventilating pipes; cast-iron street gulleys. Specifications and other particulars may be obtained on application from F. Spencer Yates A.M.I.C.E., the surveyor to the Council, at the Town Hall, Waterloo. Sealed tenders, on forms supplied and endorsed "Tender for —," are to be delivered at the Town Hall, Waterloo, by Mar. 24.

Mar. 24. Gateshead.—*Supply of the following materials for one year, for the Borough Council:*—Whin stone macadam, Whin setts, Whin chips, Wain curb, Whin channel, Whin wheelers, limestone macadam, Freestone and Caithness flags, metal gulleys, manhole covers, &c.; shovels, picks, scavenging brooms, lime and cement. Specification and form of tender can be obtained at the office of N. Percy Pattinson, borough surveyor, Town Hall. Tenders are to be sent in, sealed and endorsed "Tender for Materials," by Mar. 24.

Mar. 26. London, E.C.—*Supply of the following stores, for the Madras Railway:*—Bar iron, steel sheets, plates and wire, zinc and tin sheets, copper and brass sheets and wire, pig lead, white and red lead, paints and colours, carpenters' and engineers' hand tools, anvils, hammers, ricks, crowbars, spanners, bollows, files, screwdrivers, nails, glass, crockery, ironmongery, leather, lamp wicks, locks, wire netting, hammer handles, saws, chain, shovels, grindstones, tar, turpentine, varnishes and brushes, as per specifications to be seen at the Company's offices, for which a charge will be made (which cannot be refunded). Tenders to be delivered in sealed envelopes, endorsed "Tender for General Stores—Part I." (or Part II., as the case may be), to W. H. Cole, secy., 1, Broad Street Place, Finsbury Circus, London, E.C., by noon on Mar. 26.

Mar. 31. Truro.—*Horse hire and materials, for the City Council:*—To supply the whole or part of the horses and carts required for sanitary work, highways, general, and the carriage of road metalling. The following materials are required:—Road metalling; glazed socketed earthenware pipes, bends, junctions, gulleys, &c.; granite kerbs, paving, channelling, &c.; iron castings, lamp-pillars, gully-grids, frames, gratings, &c.; bass and rotary brooms; and disinfectants. Specifications, for form of tender and all other information to be obtained at the City Surveyor's Office. Sealed tenders, upon the forms supplied, suitably endorsed, according to class of goods tendered for, to be delivered at the City Surveyor's Office, Truro, by 10 a.m. on Mar. 31.

FIRE SUPPLEMENT (MONTHLY).

THEATRE PROTECTION.

THEATRE safety, though probably one of the oldest problems dealt with under the head of fire-prevention, still occupies a most prominent position in the debates of the technical and fire-service societies of the world. Why this should be necessary we scarcely know, seeing that practically the whole of the problems of theatre protection have long been solved in this Metropolis, as also in Vienna and Berlin, and that it is scarcely possible to obtain any new results or new experiments excepting in the one direction of the fire-resistance of scenery. Ever since 1881, when the great Ring Theatre fire of Vienna shocked all civilized countries, the questions as to theatre safety have been thoroughly thrashed out. They have long been summarized, and we might say that final results were obtained about 1900, with the one exception of the scenery question just referred to. The time we think has now arrived when the different countries could combine to agree to certain standards of fire-protection applicable to the different classes of theatres and variety halls throughout Europe and the United States of America. The time for argument and suggestion has passed; the time for standardization has arrived. It would be well if the British Fire Prevention Committee who took the lead in standardizing questions as to the fire-resistance of materials would take this matter up of standardizing the primary measures of theatre safety by calling together a conference on the subject to finally set up the principles which could find universal adoption in all countries as being the minimum requirements necessary for the safety of the public and the artistes concerned.

The theatre is very much an international institution; theatre companies travel from one country to another, our own companies visiting the most distant colonies, and, for instance, French companies constantly being seen in Russia, Egypt, &c. The public that visits the theatres, too, is international in the extreme, and no visitor to any city can scarcely avoid spending some part of his evenings in the local playhouse. Thus, if any subject may be technically of international importance and of mutual interest to the inhabitants of all countries and to the artistes of all countries it is that of theatre safety, and the sooner standardization is achieved the better.

We have from time to time dealt with the question of the tests on matters of theatre safety which were conducted at Vienna with a model theatre. We now publish (on the next page) some very interesting drawings which have been prepared by Herr Seeling, of Berlin, indicating a section of a number of Continental theatres with the view of showing the space that is as a rule filled by smoke and noxious gases upon an outbreak of fire in the stage, which gases it is desirable should escape as rapidly as possible by ventilators or ducts in the roof over the stage; the sections also showing the relation of this space over the stage to the gallery seating with the unfortunate well room or dive that

is so frequently a feature of theatres, and places a part of the audience at a point to which the gases and smoke are easily drawn. These sections are all drawn on an identical scale in relation to the model theatre that was under test.

To all interested in questions of theatre safety and safety from fire in large assembly rooms these drawings should be of considerable interest, and we present them as a most valuable contribution on Herr Seeling's part towards demonstrating the absolute necessity of everywhere freeing such buildings from smoke and noxious gases in the event of a fire.

CONCRETE AS A FIRE-RESISTANT.

WE have from time to time dealt with the important question of the fire-resistance of different concrete aggregates. Although the official reports on the British Fire Prevention Committee's tests of last month have not yet been issued, it is an open secret that they have borne out to a most remarkable degree the experimental tests which were executed last autumn with various bays of concrete: two firms engaged in reinforced-concrete construction having adopted for their concrete aggregates very similar to those which had withstood the experimental test so well, and which as now applied on a larger scale have borne out the expectations in respect of them in a most remarkable manner.

On another page of this present supplement we give some notes regarding these tests of last month. These we would supplement by saying that the New Expanded Metal Co.'s reinforced concrete floor was a floor of brick aggregate with "Ferrocete" cement, and that the floor designed by Messrs. Skelton & Co. had a clinker-concrete for its bays and coke-breeze concrete for its girder coverings.

To all who have followed the tests which are being conducted by the Committee and those which are being undertaken by the Columbia University of New York, it must have been observable that the expanded metal results in London surpass those which were obtained in the United States, and we attribute this in the main to the more suitable aggregate and the better cement employed in the London test.

Regarding the floor designed by Messrs. Skelton & Co., it was practically identical with the one tested in August, 1905, by the Committee, but in that case Thames ballast concrete was used and failed lamentably, the coverings of the beams breaking away and some minor bays actually collapsing. With the concrete used last month the same design of floor withstood its test with little or no damage.

We can of course not deal with the tests at length until the official reports are issued, but only comment on such points as are common property. Thames ballast concrete will, we trust, soon be a thing of the past where fire-resistance is desired, although it will of course long remain in use where fire-resistance is of no interest.

TWO LONDON FIRES.

AS in our previous supplement, we again give particulars of some of the notable fires of the past few weeks with the view of demonstrating the extraordinary wreckage occasioned in buildings that are not adequately protected against fire, and we have selected as examples two fires—the one at the Oil Mills, Poplar, and the other at Messrs. Johnson & Phillips' premises at Old Charlton. The former of these fires took place on the 25th of February and the latter on the 26th.

The Poplar Oil Mill.

The Oil Mill fire broke out at 7.30 p.m. on Sunday evening, February 25th, on the property of the Cotton Seed Co., Ltd., Wharf Road, Cubitt Town, these premises being used as seed oil crushing mills and stores. The general arrangement of the property is best seen from the plan presented (see Fig. 4), the main buildings comprising each five floors and their frontage to the river being about 120ft., with a depth of about 150ft.

The fire broke out in the mill, and is supposed by some to have been caused by friction, but of course suppositions of this kind—unless supported by actual proof—cannot be relied upon.

An early attempt was apparently made by the private firemen on the spot to cope with the fire, but it is reported that they did not take the precaution to immediately call in the fire brigade, and time was thus wasted. The result was that when the brigade arrived in force they found a fire of considerable severity, and they had to limit their efforts to prevent its spread to other property. The fire was attacked both from the land and the water side.

The total schedule of insurance on the property is upwards of £60,000, of which it is believed that Lloyd's had £51,000. Of the £60,000 apparently quite one-third had been lost.

From the technical point of view, the most interesting feature was that the cast-iron frames of the wrought-iron doors, which former were bolted to the walls, although remaining in position split in various places (see Fig. 4). The doors themselves, though of unusually heavy construction and fastened with heavy bolts, buckled. This all points to the absence of provision for expansion in the doors and frames. There were of course double sets of doors with lobbies between them, otherwise the flames would have passed into the adjoining block through the openings formed by the buckling of the doors on the fire side.

Further interesting points are to be found in the entire destruction of the steel supports and beams, as is to be expected where they are so unwisely left without suitable covering or protection. The views (Figs. 1, 2 and 3) taken from three points show quite a remarkable picture of the havoc wrought through the absence of primary structural safeguards. They should be an object-lesson to architects, and could also well be shown to clients.

Apart from the technical questions involved, we think this fire is again one of

THE ACCUMULATION OF SMOKE AND NOXIOUS GASES OVER THEATRE STAGES: DIAGRAM OF CONTINENTAL THEATRE SECTIONS. PREPARED BY HERR SEELING, ARCHITECT, BERLIN.

those instances where the present efficiency of the London Fire Brigade has once more shown itself in a most effective manner; the tactics employed in the operations certainly saving a vast amount of property, regardless of the fact that the brigade was hampered by what we would term "a late call."

Johnson & Phillips' Fire.

Turning to the fire at Messrs. Johnson & Phillips's Cable Works, the department affected by the fire was that of the cable covering section. These premises covered a large acreage, but the fire in question was limited to this particular workshop. Unsuited construction is again the cause of unnecessary havoc.

THE MILAN CONGRESS.

THE interest in fire-prevention in Latin-speaking countries has been somewhat in abeyance, but no doubt the impending International Fire Congress at Milan will assist matters materially. We understand that among questions under review at the Milan Conference will be the discussion of reinforced concrete as a fire-resistant, and that this all-important question is to be dealt with by Mr. James Sheppard, senior surveyor of the North British and Mercantile Insurance Co. Mr. Ellis Marsland has been entrusted with the question of protection to door- and window-openings, another subject which is to be dealt with at this congress. Subjects new to the conference will be the prevention of fire on railways and ships; and the protection of life in factories, warehouses and similar buildings. It is interesting to observe that in what some ten years ago would have been essentially a fire-service or fire-brigade congress no less than four out of ten subjects under review deal specially with questions of building construction.

FIRE AT JOHNSON AND PHILLIPS'S ELECTRICAL WORKS, OLD CHARLTON, KENT.

FIRE-RESISTING CONSTRUCTION.*

By Alfred E. Corbett, A.R.I.B.A.

MY subject is far too wide to permit in one evening anything like an exhaustive summary, and I can only attempt to outline some of the main principles involved, with some notes on systems of flooring.

My notes will refer chiefly to ordinary town commercial buildings. Many such buildings, with their light joisted floors, matchboarded partitions, &c., seem to be built on purpose to burn easily, and the appalling speed with which fire races through them causes heavy financial loss and may easily cause loss of life. In every building architects should endeavour to avoid such flimsiness of structure and to provide at least some measure of temporary protection to give the occupants a chance of escape and the firemen a chance of quelling the outbreak.

Beyond this essential minimum the value of truly fire-resisting construction from a purely commercial point of view is somewhat open to debate. The cost will be greater, and it is very difficult to get an adequate return from the insurance companies in the shape of reduced premiums.

This attitude of the companies is probably in great measure due to the absolute failure of many so-called "fireproof" buildings in the past, and we may hope that, now the science is better understood, more recognition will be given to fire-resisting construction. I should mention as a step in the right direction the publication in July last by the Fire Offices Committee of two "Specifications for fire-resisting buildings." These can be had from the Fire Offices Committee, and are on the whole very well drawn up. It is stated that buildings erected in accordance with these specifications will be insured at reduced rates, but information cannot be obtained as to just how much reduction will be made.

The defect appears to be that the rules are not elastic enough for practical usefulness. The American systems of schedule rating offer much more encouragement to architects. In them a schedule is drawn up including all likely varieties of construction and detail, with so much per cent. deduction from or addition to the premiums for each variety.

This enables an architect to tell his client exactly how much return he will get for his outlay on any particular improvement.

Of course it is possible to spend money so that a building shall be practically secure from destruction by fire, and to recoup ourselves for the extra outlay by not insuring at all. This has been done in some cases, but would be deemed too speculative by most clients, especially as the combustible contents are always liable to be burnt, no matter how perfect the building, just as coal is burnt in a fireproof stove.

This purely business aspect of the subject—the question "Does it directly pay the individual owner, financially, to put up a really fire-resisting building?"—is perhaps the only weak link in an argument in favour of fire-resisting construction. Even on these grounds I believe it would pay in some cases, but I fear not in many at present.

There is, however, the important argument that a fire-resisting building ensures freedom from the interruption of business caused by a fire and consequent rebuilding. This alone is worth a considerable sum of money, though it appears somewhat intangible when compared to a reduction in insurance premiums. The apparent advantage of a fire in enabling an owner to rebuild on a more convenient plan is negated by the fact that the insurance agreement is only to reinstate, *i.e.*, to make the building as it was before the fire; and rebuilding on different lines can generally only be done by losing part of the insurance.

Looked at from a national point of view, there is an enormous waste of national wealth every year by fire. The insurance companies recoup the individual owner, but they only do so by spreading the loss over a great number of owners, and the cost of their management and profits is a heavy addition to the bill.

Statisticians estimate the loss by fire in the British Isles at 17 million pounds per annum, *i.e.*, the structural value of the Manchester Town Hall destroyed by fire every ten days. If to this actual loss we add the cost of sustaining the insurance companies, we find that the nation loses the value of the Manchester Town Hall every week; and this by fires the greater part of which could easily be prevented by proper construction.

A still more potent argument is the fearful danger of loss of life through fire, terrible examples of which keep occurring. This

(Note buckling of doors and breakage of frames.)

alone should induce architects and owners to make every effort towards good construction, and, taken with the other arguments, makes a conclusive case in favour of fire-resisting construction.

A Fire-resisting Staircase the First Essential.

Taking the safety of human life as the first essential, the staircase is the one thing that must be fire-resisting in any reasonably-constructed City building. The material should be concrete reinforced with steel; or it may be some kind of hardwood used in large sizes. The very worst material to use is stone. The portion of a stone step exposed to the heat of a fire expands, while the ends, embedded in the walls, retain their original size; the natural consequence being a fracture near the wall. The application of water hastens the effect.

I may quote a Scotch fire-brigade officer's account of a fire in a building, where "two flights of unprotected and lightly constructed wooden stairs" were "joined by a stone landing 5ft. square and 5ins. thick. After the fire both wooden stairs were much damaged, but admitted the passage of the firemen; the stone landing had collapsed into a thousand fragments!"

Other cases might be cited showing that even a comparatively light wooden stair is better than a stone one, and a heavy wooden stair is much better, being little inferior to a good concrete stair.

To Limit the Spread of Fire.

Having considered this elementary precaution against loss of life, the point of next importance is to limit the spread of fire through the combustible contents of the building.

In London there is a legal limit of 250,000 cub. ft. as the extent of a warehouse. In Manchester and Salford there is no limit under the by-laws, but the insurance companies' tariff charges extra premiums for any Manchester warehouse over 300,000 cub. ft. in extent.

If a fire could rage unchecked through 300,000 cub. ft. of warehouse it would be very likely to get beyond the control of the fire brigade, and sub-division into smaller "risks" is very desirable.

This should be done by using fire-resisting floors throughout; but even in buildings of ordinary construction the need for sub-division exists, and after the great Cripple-gate fire of 1897 most of the new buildings erected on this site were given at least two fire-resisting floors—one over the ground floor and one over the second or third floor—thus cutting the building up horizontally into three risks instead of one.

Open Wells a Danger.

Many buildings are divided horizontally by fire-resisting floors, but have the value of the division very nearly destroyed by leaving the stair and lift wells open, forming possible furnace shafts right up the building.

It is essential to real protection that these wells should be enclosed, preferably by brick walls, and that all openings into them should have close-fitting fire-resisting doors. Wooden doors covered with tinned sheet steel are frequently used for this purpose. The British Fire Prevention Committee has tested some of these doors, giving the better results of the two kinds tested. It is very important that the doors should not twist, to prevent the passage of what is known as a "fire-haze"—i.e., an exceedingly hot vapour produced by the fire, which will burst into flame as soon as it reaches the fresh air, and may get past a twisted door and carry the fire into an upper storey of the building.

To be even more secure against spread of fire up staircase wells many American and some Continental warehouses or factories have

stairs enclosed in brick towers outside the buildings, approached on each floor level by short open galleries. This is an excellent plan where practicable, as it leaves the floors unbroken by any openings.

The enclosing walls of a staircase well must be carried up through the roof, and the roof of the well should consist of light iron framing supporting ordinary thin glass. This use of thin glass has been much debated, but is now generally agreed to be the best treatment. The object is automatic ventilation of the enclosed well in case of fire. Any hot vapour or smoke ascending the well would break the thin glass almost immediately, and would then escape freely into the open air, with no tendency to force its way through chinks of doors into other floors and so spread the fire.

How Windows Spread Fire.

Even though the floors be fire-resisting and the stair wells properly enclosed there is still a possibility of fire spreading from a lower to an upper floor by means of the windows, especially where they face an enclosed court or well, which acts as a chimney and forces the flames against the upper windows.

There is still greater danger from ordinary windows, i.e., the "exposure hazard." When a hot fire occurs in a building facing a narrow street or area the glass windows in any opposite building will soon begin to crack and the woodwork to smoke, and very shortly the second building is on fire.

This exposure hazard is commonly ignored, but its importance can hardly be over-emphasized. It is most illogical to spend a considerable sum of money in making a building fire-resisting, and to take no precautions whatever against fire entering your building by the windows and destroying its contents.

How to Protect Windows.

The best window protection is the use of steel roller shutter doors or tinned wooden shutters, made like the tinned wooden doors before mentioned. It is advisable either to have the shutters fitted to close automatically, or else to have gear for closing them simultaneously.

When the window frames, &c., are incombustible the shutters should be outside, to save them from damage.

When wooden frames are used the shutters should be inside, as if they were outside there would be a possibility of the sashes igniting by the heat of the shutter and admitting the fire.

Next after shutters the best protection is the use of fire-resisting glass in the windows,

and this has the great advantage of always being in position, whereas shutters may sometimes be left open through carelessness or accident.

The principal kinds are Pilkington's wired-glass and Luxfer prisms, and I have prepared a rough table summarizing the British Fire Prevention Committee's tests in this direction.

No glass can be expected to stand in large areas, and the limit of size should be 4 sq. ft.

A point in which fire-resisting glass is inferior to shutters is that it does not stop radiant heat, so that it is possible for a hot neighbouring fire to radiate heat through the glass and ignite the goods inside without in any way breaking the glass.

Another useful check against the exposure hazard is the use of external sprinklers or "drenchers," which may be made to work either automatically like ordinary sprinklers or by a valve worked from the pavement.

Slow-burning Construction.

Turning now to the construction of floors. &c., we may note the claims of what is known as "slow-burning construction" or "American mill construction," i.e., brick walls, heavy wooden posts and beams, and heavy plank floors, which are generally finished with a thinner upper surface of hardwood.

Although ordinary light wooden joists and thin floor-boards are about as inflammable a construction as it is possible to find, if we take a somewhat larger quantity of wood and concentrate it into beams and planks of heavy scantlings we shall find that even an intensely hot fire will only destroy it very slowly, and that it can be relied on to carry its load more safely than any unprotected steelwork or even than many structures laying claim to be considered fireproof.

Favourable Testimony.

There is nothing new about this system, and as evidence in support of it I will read part of a letter written to the "Times" thirty years ago by the Chief of the Metropolitan Fire Brigade (Sir Eyre Massey Shaw) concerning the behaviour of some 12in. square pitch-pine posts which were tested in a very severe warehouse fire and afterwards by a further fire test. He concluded that "a massive storey post of even the most inflammable wood is absolutely and perfectly proof against any heat which can be applied to it, will not of itself burn at all, but requires a continual supply of highly inflammable substance to keep it burning, and when this supply is withdrawn ceases to burn, and lastly, after being exposed for seven hours to flames of very great intensity,

SUMMARY OF BRITISH FIRE PREVENTION COMMITTEE'S GLAZING TESTS.*

Red Book.		Number and size of lights.	Duration unbroken.	Maximum temperature.	Note.
			Minutes.	Degs. F.	
95	Pilkington's wired glass	5, each 2ft. 3ins. by 4ft. 6ins.	45, unbroken	1,500	Bulged 1½ins. Water made two small irregular holes.
97	Pilkington's wired glass skylights.	4, each 2ft. by 2ft.	45, unbroken	1,660	Bulged, but not displaced.
91	Luxfer prism casements, 4in. squares and diamonds, &c.	2ft. by 2ft.	45, unbroken	1,520	Bulged ¾in. No glass displaced.
29	Luxfer prism casements, 4in. squares.	3, each 3ft. by 4ft.	35, fell in	1,660	One remained in position, except for 14 squares.
20	Luxfer prism casements, 4in. squares.	3, each 3ft. by 4ft.	21, flames through.	1,500	In position for 30 minutes, but buckled zins. Seven prisms broken.
31	Pilkington's wired glass casements.	3, each 2ft. 10ins. by 4ft.	30, flames through.	1,760	Glass unbroken for 45 minutes, but doubled up.
32	Pilkington's wired glass skylights.	2, each 2ft. 6ins. by 4ft. 7ins.	30, unbroken	1,650	Bulged zins.
30	Luxfer prism skylights 4in. squares.	5, each 1ft. 8ins. by 3ft.	21 to 30, fell in	1,290	One remained 30 minutes unbroken.
33	¾in. plate glass - - -	3ft. by 4ft.	12, broken	1,220	—
33	Leaded lights, 4in. squares -	3ft. by 4ft.	7, broken	1,050	—
33	32 oz. sheet glass - -	3ft. by 4ft.	6, broken	1,030	—

* This summary is the author's, and not the Committee's official summary of tests, which is to be shortly issued. Different makes and thicknesses of glazing were under test.

† These three tests resulted in classification as affording "temporary protection" against fire.—Ed. B.J.]

is not injured to a greater depth than about 2 ins. from the original outer surface, and still shows a centre as clean and fresh as when it was first put in."

This he considered to be "strong practical testimony in favour of massive timber for the internal supports of heavily loaded buildings." There is much more recent evidence to the same effect.

Other authorities object to the system on several grounds. Firstly, and I think with most reason, on account of the danger of dry-rot. To guard against this many precautions should be taken to which I have no time to refer, but even with the greatest care and the most efficient ventilation it is difficult to be absolutely secure against rot.

Then there is the dense smoke sometimes given off by burning timber, which may suffocate the occupants before they can escape.

Lastly, I may quote from a recent lecture to the Royal Institute of British Architects by Mr. Gibson, of New York:—

"It takes longer to impair the strength of floors and pillars of this kind than it does those of unprotected iron. Yet very large conflagrations have proved that after all it is only a question of a limit to be passed when the massiveness of the timber becomes a horrible addition to the quantity of fuel. It may be safely asserted that the days of slow-burning wooden constructions are numbered so far as concerns large cities."

The question of heavy wood *versus* protected steel is still an open one. I believe that the former is the better in some cases, though not in all, and it is important to know the best kind of timber to use.

Tests on Solid Timber.

There are several British Fire Prevention Committee tests to refer to. Red Books Nos. 73 and 18 refer to fir timber, and show that a severe fire for two hours destroyed the surfaces of beams, &c., to an average depth of 2 ins. Nos. 71 and 79 refer to the Australian hardwoods, jarrah and karri, and show that a still more severe fire for two hours only destroyed the surfaces to a depth of 1 in., as compared to 2 ins. for the fir timber, conclusively proving the superiority of the Australian woods.

There are also about twenty tests of solid doors of various woods. Comparing the results of all these tests we find that jarrah is very slightly better than karri, and that the two are much in advance of any other timber tested. The others in order of merit are oak, teak, deal and pitch-pine.

What is Fire-resisting Construction?

Fire-resisting construction, as distinguished from slow-burning construction, implies the absolute disuse of combustible material and the thorough protection of such materials as iron and steel, which, although incombustible, are far from being fire-resisting.

As the disastrous effects of fire on unprotected iron or steel are so well known, I only need say that for use in any fire-resisting building these materials should always be protected adequately.

Of fire-resisting materials undoubtedly the best for building purposes is good common brickwork set in lime-mortar.

Almost equally efficient is the best concrete, but various kinds of concrete differ greatly in fire-resisting value. Broken stone or ballast concretes are the worst for fire-resistance. The aggregate should be a substance which has already passed through fire, and many experiments and results of actual fires indicate that coke-breeze is the safest aggregate to use. Coke-breeze concrete is not so strong in the first instance as most other kinds, but tests have shown that after the application of a severe fire test to several kinds of concrete the coke-breeze concrete suffered so little comparatively as to be actually the strongest after the test.

FIRE AT BYERDEN MILL, BURNLEY.

Red Book No. 16 affords confirmatory evidence, and Red Book No. 101 describes an interesting test carried out last October on concrete with seven different kinds of aggregate.

This test does not finally settle the matter, and the Committee hopes to undertake further similar tests,* but as far as the results go they indicate that coke-breeze is the best aggregate, it having been the only slab which remained flat and free from cracks throughout the severe three hours' test.

All the other slabs cracked more or less except the burnt-ballast concrete (*i.e.*, with burnt clay as the aggregate), and as the water jet at the end of test washed off about 3 ins. of the surface of this concrete it was hardly satisfactory.

The other aggregates, in order of merit, as nearly as one can tell from this test, were furnace slag, broken brick, furnace clinker, broken granite, and, much the worst, Thames ballast.

What is Coke-breeze?

A point of the greatest importance is the definition of what "coke-breeze" really is.

In a gasworks small coal is put into a number of closed retorts; these are heated by a furnace, the gas is driven off from the coal, and ordinary coke is the result.

The smaller lumps and dust of this coke are usually considered to be coke-breeze fit for making concrete, but this is quite wrong, as the small coke is combustible and will burn out from the concrete.

When the retorts are emptied a small proportion of the coke is transferred to the furnace beneath them to provide fuel for heating the retorts. After being thoroughly burned in this furnace it drops through the bars into the ash pan, and is, therefore, sometimes called "pan-breeze." It is this material which should be used for concrete.

Major Winn, R.E., defines coke-breeze as "the incombustible residue of coke fires," while the new Building Act of Chicago defines coke-breeze as "cinders from steam boilers." There is probably no appreciable difference between the two, but there is a very obvious difference between this burnt material, whether from coke or coal fires, and the unburnt coke commonly used.

The United States engineer's official report on lessons from the Baltimore fire says:—

"On the whole cinder concrete is safe only when subject to the most rigid and intelligent supervision; when made properly, of proper materials, however, it is doubtful whether even brickwork is much superior to it in fire-resisting qualities, and nothing is superior to it in lightness, other things being equal."

The other material chiefly used for protecting steelwork is terra-cotta, which may be either porous, semi-porous or hard burnt,

* Several additional tests have already taken place.
—ED. B.J.

though hard-burnt terra-cotta is much the least efficient of the three.

Time will not allow consideration of other materials employed.

American Floor Systems.

Before discussing any British system of flooring it may be well to glance at some American work, intended to be fire-resisting, which failed in the great Baltimore fire of 1904. The usual type has steel joists about 5 ft. apart supporting flat arches of hollow hard terra-cotta. The soffits of the steel joists are protected in many cases by clipping a terra-cotta slab under them with metal clips, which generally proved to be the weakest point of the protection. The steel columns are surrounded by hollow slabs 3 ins. or 4 ins. thick. In many buildings the lower webs dropped off throughout the building, exposing the steelwork and ruining the strength of floor. In cases where the webs were thicker less damage was done. To again quote the United States engineer's report: "The trouble with the hollow terra-cotta tiles, as commercially applied, is that they have been skinned down to a minimum thickness; the webs are rarely more than $\frac{3}{8}$ in. thick. When exposed to the fire these soon get red hot; the rest of the tile, being surrounded by dead air-spaces, remains cool; the change in temperature near the junction of exposed and non-exposed webs is so rapid that stresses are set up exceeding the strength of the material and the exposed web drops off. If it does not, do this under the heat alone, a stream of water from the nozzle of a fire hose quickly brings about the same result. If the material in the webs were made thicker, so that entire variations in temperature would occur within the thickness of the exposed web, these stresses would not exist, and a steel frame so covered would be able to resist many fires with no loss to itself worthy of note." He advises $1\frac{1}{2}$ ins. of porous terra-cotta as the minimum.

In all these Baltimore examples the weakest point was the soffit protection of the joists. Where metal clips were used for fastening the protecting slab they always gave way and exposed the joists.

(To be concluded.)

A MILL FIRE.

BYERDEN MILL (also called Lodge Mill), Burnley, was destroyed by fire at the end of last October. It was built about forty years ago. It has been suggested that the fire was caused by sparks emitted from a railway engine, the line immediately adjoining mill. All the interior of the mill was wood except pillars. The whole of the interior was burnt out, and the remains were in such a tangle that the scrappers used dynamite to get into it. The dangerous masonry was similarly gutted. The mill is to be rebuilt for a weaving shed for 750 looms.

FIRE TESTS.**"Kulm" Ceilings.**

WE are presenting in the current issue an illustration taken from Report No. 105 of the British Fire Prevention Committee's publications, illustrating a ceiling constructed of "Kulm" pumice slabs applied below an ordinary wood joist floor with a view of affording temporary protection against fire.

We have in a previous supplement mentioned this test, but we would specially call attention to the illustration as showing that neither fire nor water passed through this ceiling in the course of a test of forty-five minutes' duration in which the fire attained a temperature of over 1,500 degs. Fahr., and which fire test was followed by the application of water from a steam fire engine for a period of two minutes.

The summary of the report states that the ceiling was found to be intact, and there was no charring or scorching of the woodwork; there was no sagging of the ceiling and the latter remained tightly fixed to the underside of the joists.

The application of this ceiling merits attention as a simple matter in protecting an ordinary wood joist floor against fire. In the current Building Act Amendment Act owners of projecting shops are apparently permitted to fill in between the joists with a dry concrete slab, and nothing is said

about jointing up these slabs or making the job a really sound one. Surely it would have been much better and simpler to provide some application of a ceiling to the underside of the joists of this description. The mere filling-in of loose blocks allows smoke and flame to easily get through and to crawl up on either side of the wood joists. How the application of such dry blocks ever came to be specified as according fire-resistance is indeed a matter of wonderment to all who really understand what happens at fires. No doubt in the many re-amendments and alterations the Act had to pass through, the dry block with its possible open spaces crept in unawares.

A Further Series of Tests.

A further series of important fire tests were completed the week before last, their investigations terminating late on Saturday. There was a considerable attendance of members and visitors during the week, including the representatives of the various Government departments concerned. The tests as usual were conducted by sub-committees.

Reinforced Concrete Floors.

Two concrete floors were under test for the purpose of classification as affording "full protection" (class B) against fire, this necessitating a fire test of four hours at temperatures reaching between 1,800 degs. Fahr. and 2,000 degs. Fahr., followed by the

application of water from a steam fire engine for five minutes (two branches), the floors being loaded with $2\frac{1}{2}$ cwts. per ft. super. The one floor was of brick concrete reinforced with expanded metal supported by encased ordinary girders. The other floor was of clinker-concrete reinforced with small joists, supported by encased broad flange girders. In both "Ferrocete" cement was used and the period allowed for the setting and drying was almost the same. Both floors obtained classification as affording "full protection." By the last named floor test, among other matters, the superiority as a fire-resistant of clinker-concrete versus Thames ballast concrete was again proved, a floor of almost identical design of Thames ballast concrete having failed last autumn.

Roller Shutter Door.

Two fire tests with roller shutter (Kinnear type) were also completed—one with double shutters for a four hours' test, and one with single shutters for a two and a half hours' test, followed by the application of water. Both attained classification as fully protective (class B and class A respectively). Both were of thin steel plate under $\frac{1}{16}$ in. thick, and both had, prior to the final application of water, been subjected to streams of water fifty minutes before the conclusion of the tests, *i.e.*, had this additional test applied beyond what was necessary for classification.

VIEW OF UNDERSIDE OF "KULM" CEILING AFTER TEST.

Repetition in Architecture. THIS is a question of much interest. The architect must necessarily come under the same criticism as the painter, but there is this difference between them, that the conditions of the architect's problems are very often exactly similar to those of a previous building he has carried out; and, moreover, there is a tendency for architects to become restricted to one class of work, such as schools or workhouses or hospitals. It naturally follows that where the conditions are the same the results must be similar, except for the additional knowledge of details which the architect acquires in the actual execution of the several problems, resulting in a better solution than he achieved before. But very few buildings are the same in every particular. The clients have generally very different desires, or at least different ideals, and the latter are not beyond the conditions which the architect should endeavour to express and fulfil in the completed work. There is, however, a tendency on the part of the public to restrict the architect, like other artists, to the style with which he has made them familiar. We have several examples of well-known practitioners whose work is praised as distinctive, but on closer inspection it will generally be found that the distinction is traceable to the fact that they show little or no development from their original essay. Now, though it is much less reprehensible that a man should repeat a

style of which he may be regarded as the complete inventor, yet architecture is the result of the experience of the past, and a man seldom breaks away completely from tradition, unless it is in l'Art Nouveau or in the arts and crafts style—if we may so call it—a style which may be said to be based on an ignorance of precedent and the unbounded liberty of the individual to put forward the disordered fancies of his brain. For an artist to show such want of development betokens limited ability; and powerful as the influence of the public may be to restrict him to a style to which they have become accustomed, and so appreciate, he should strive always against it. We do not suggest that architects should do as some well-known members of the profession did twenty or thirty years ago, namely, leap nimbly from the copying and development of one particular phase of past architecture to another—Early English, Renaissance, Elizabethan or what not; but we think it would have been better for these architects to have taken as their starting-point one particular phase and to have developed it to fit modern conditions, and then gone on from that point to the evolution of a modern style.

A Colonial Example. It is refreshing to see the interest which is taken in America and abroad in the development of cities according to some scheme. San Francisco only a short time ago decided to spend £2,000,000 in the development of the city according to the plan of Mr. D. H. Burnham, the well-known American architect. The latest scheme we hear about comes, we are glad to say, from one of our own colonies. The Ontario Association of Architects some time ago appointed a committee to draw up a plan of improvements for Toronto, and it seems very probable that this plan will be adopted in great part by the Legislature, and the growth of the city thus forced to expand logically in accordance with some definite scheme. We have all seen the want of some such plan in our own towns, and we can appreciate how important it is to settle what land is to be purchased and laid out as parks and main thoroughfares while the land is yet purchasable at a reasonable figure. Toronto, it seems, is to be free of that defect in the future. Mr. W. A. Longton, the chairman of the plans committee, says: "When we leave Toronto, as the Scotchman leaves Edinburgh, can we look back to old Toronto as he looks back to 'Auld Reekie'? I am afraid not. The reason is that Edinburgh has character; it is called the modern Athens I suppose because of its hill. We have none of those natural advantages in Toronto; we have to make them. I do not say we have no advantages, but they are not of such a salient character that you cannot snow them under with cheap houses. There is not anything that we cannot spoil, in Toronto. But if we

will preserve it and make it a town of some character, then we shall feel when we come back as I heard a man on an ocean vessel say he felt in going back to Boston. He said he had seen nothing in his travels that he liked so well as the golden dome of the State House on Beacon Hill. That one can believe. Beacon Hill and Boston have something to which one can attach himself; something to make a man say, 'This is my town; I was born in Boston.' Oliver Wendell Holmes makes one of his characters say, 'I am a Boston boy.' That cannot be said of any town that has not got a strong and definite character. In Toronto that character must be made by planning."

Dominating Aldwych and Kingsway. THE London County Council have had some trouble to find speculators willing to utilize the most important part of the site in the Aldwych and Kingsway improvement scheme. We refer to the central portion of the arc bounded by Kingsway, with the Strand as a chord, and on the two sides by the soft approaches. This site dominates Kingsway and will be the largest block of buildings on the Strand frontage, so that it is important that there shall be no piecemeal treatment of it. There have been several schemes proposed, and the latest is that which was brought before yesterday's meeting of the London County Council, with the approval of the Finance Committee. This is for a lease of ninety-nine years at a ground rent of £55,000 a year. The site has frontages of about 636ft. to Aldwych, about 413ft. to the Strand, about 236ft. to the approach on the west side of the site, and about 231ft. to that on the east side. The proposal has been made by Mr. L. Wormser on behalf of a syndicate who have prepared a scheme for developing the site as a whole. A company is to be formed for this object with a capital of £1,000,000. It is proposed to erect on the central portion of the site a stone building of commanding architectural features. This building will contain large galleries for use in a permanent exhibition of arts and manufactures; it will also contain a theatre, a concert hall and a restaurant. Beyond the central block of buildings the site will be enclosed by shops with basements, ground floors and two floors above. There will be seventy-eight shops on the ground floor and seventy-eight on the first floor, while the second floor will be let for commercial purposes. The promoters have undertaken to spend not less than £500,000 in the erection of these buildings. There will be no larger area between the shops and the central building than that which is necessary to provide for the access of light and air. The plans, elevations and specifications of all the buildings will be entirely subject to the Council's approval.

BUILDING LEGISLATION.

A Comparison of English and American Laws.

By Horace Cubitt, A.R.I.B.A., P.A.S.I.

THE erection of buildings in this country has been for many years so much influenced by various regulations that it seems surprising that there is very little in print either in the proceedings of institutions devoted to furthering the interest of good building or in the professional press which gives in comparative form our own building regulations and those of other countries.

In the present article an attempt will be made to institute a comparison between building legislation in London and the provinces and that in the cities and towns of the United States. Rural by-laws being of such a diverse nature, no general conclusion can be arrived at, and they have therefore not been dealt with.

It may, however, be considered that building legislation in the United States is hardly able to be favourably compared with that in this country. It is indeed true that administration in the American cities has often been justly condemned for the want of honesty and integrity to which on the whole we are accustomed, but the great improvement in this direction which has recently taken place still continues, and it will be shown by subsequent quotations that when properly administered American regulations in many respects tend to the erection of better buildings than our own by-laws.

The subject in its entirety is so wide that it is only possible to deal with it at all successfully in a short article by devoting special attention to one of the main branches. It has therefore been decided to limit the review to regulations having reference chiefly to the construction of buildings, the question of sanitation, sufficient in itself for another article, not being touched upon.

Typical American legislation will be taken and compared with that current in places with similar populations in this country, and thus, the conditions of life being not very dissimilar, it is hoped that a fair comparison will be made. The building laws of the State of Massachusetts will first be considered, then the special laws relating to the city of Boston, and in conclusion the New York Building Code will be dealt with. The first two enactments will be compared with the well-known original Model By-laws issued by the Local Government Board, upon which the building regulations of almost all our provincial towns are directly based, and the last with the London Building Acts of 1894 to 1905.

The Laws of Massachusetts.

dealing with the inspection of buildings, besides being what we should call adoptive, are also of a very elastic nature, it being stated that every city or town which accepts these provisions may "for the prevention of fire and the preservation of life by ordinances or by-laws not inconsistent with law," and applicable throughout the whole or any defined part of its territory, regulate the inspection, materials, construction, alteration and use of buildings and other structures within its limits. The expression "any defined part of its territory" evidently presupposes the establishment of building limits in accordance with a common American custom, the most thickly populated part of the district being contained within these building limits, and outside which limits modified by-laws, if any, are in force. The fact is more clearly illustrated in a regulation prohibiting the erection of dwelling-houses more than 8ft. in length or breadth and 7ft. in height unless made of or covered with incombustible materials, "within such limits" as the town may from time to time prescribe. Structures

situated more than roof-top from any other building are, however, exempted from this regulation.

In addition to such by-laws as each town may frame on its own account, other provisions are compulsory in those towns which take advantage of their power of making by-laws. These provisions, which refer to (1) proper ventilation, (2) sufficient means of escape in case of fire, (3) proper fire stops in floors, walls and partitions, can be enforced with regard to all buildings except dwelling-houses which are more than two storeys in height and have accommodation for more than ten persons above the second storey. Other regulations deal with the safety of elevators, the provision of fire alarms in hotels, and the means of escape from theatres.

Merits and Defects as compared with Model Code.

Compared with our Model By-laws, the building laws of Massachusetts appear to lack the standardization, if the term may be used, which the existence of a model code provides, and if adjoining towns are able to frame no slight proportion of their building regulations with the single proviso that they must not be inconsistent with law, a very chaotic condition of affairs seems likely to prevail.

On the other hand, however, there is the very desirable absence of the cast-iron system we know so well in this country; and although the American method of instituting building limits is probably not the most desirable solution of our problem of building legislation, yet it can hardly be doubted that such an arrangement would render impossible the present unfortunate condition of affairs in some of our districts, which, though rural in themselves, yet happen to form part of an urban district and come under urban by-laws. The opinion of many English authorities appears to be rather in the direction of allowing buildings at specified distances from highways and lands of adjoining owners to be exempt from the operation of by-laws dealing with construction, and it may thus be desirable to repeat the previously stated fact that in the State of Massachusetts all structures roof-top from any other building, although within the building limits, are yet exempt from the by-laws.

Fire Regulations.

The regulations dealing with the means of escape in case of fire from buildings have no parallel in our Model By-laws, no provincial authorities having any power in this direction except with regard to places of public assembly and factories and workshops in which more than forty persons are employed.

The method of procedure with regard to dangerous structures in all the instances of American legislation dealt with in this paper is very similar to that in this country. One very important point is, however, worthy of notice: under the Public Health Act, 1875, which applies to the whole of England with the exception of the Metropolis, dangerous structures cannot be dealt with unless they are dangerous to passengers or to inhabitants of adjoining buildings. In the American instances referred to such structures come within the operation of the law if they are unsafe or dangerous to life or limb in the case of any person whatever, this being also the state of affairs under the London Building Act, 1894.

The Special Laws.

The special laws relating to the city of Boston are on the whole of a very far-reaching character, but probably less stringent regulations would not be sufficient to safeguard the interests of so large a town as Boston, the population being considerably over 400,000, and consequently slightly larger than that of Birmingham.

One of the first points which call for attention in the Boston building laws is the

existence of a Board of Appeal. It can hardly be denied that such an arrangement is far better than our custom of allowing a disputed matter to go before a magistrate with the option of an appeal to the courts, so that in no case whatever can the questions in dispute be decided by men with the necessary technical knowledge. The constitution of this Board of Appeal may perhaps be considered to be based upon rather too liberal grounds; it is formed of three persons, one appointed by the mayor and holding office for three years, one an architect chosen by the Boston branch of the American Society of Architects and holding office for two years, the third member chosen by the local master-builders' association, holding office for one year. Such a body can undoubtedly be trusted not to make the building restrictions press too hardly upon property owners, but it is to be feared that its lack of continuity of tenure must render it liable to be too easily swayed by the public opinion of the moment.

A department to administer the building laws is provided, headed by a building commissioner. No building can be erected or altered except upon a permit from the building commissioner, and in conformity with the provisions of the Act, and plans may be required to be deposited.

Classification of Buildings.

Buildings in Boston are classified as follows:—First-class buildings, of fireproof construction throughout; second-class buildings, all not first class whose external and party-walls are of brick, stone, iron or "other equally substantial and incombustible materials"; third class, wooden-frame buildings; composite: part second- and part third-class construction.

The American custom of establishing building limits has been followed in Boston, and the Building Act gives the city power to extend such limits from time to time. Every new building erected within the building limits must be a first- or second-class building, and only a few specified third-class structures used for certain purposes are allowed. Every new building (except armories and churches whose assembly halls are not more than 7ft. above street-level at the principal entrance) which is capable of seating 800 persons or more and also every theatre must be a first-class building. The height of a building in the Boston building laws is given as the distance from the kerb of the street to the level of the highest point of the roof. Every building in the city of Boston erected or raised to over 70ft. in height must be a first-class building, and so also must every building erected or converted for use as an hotel, or a tenement-house for more than two families above the second storey.

Fire Stops.

Every second-class building has to be erected in accordance with specified regulations regarding the provision of what are termed fire stops at each floor of such a building. These fire stops are required to consist of a "solid air-tight cohesive layer at least 1in. thick of tile, brick terra-cotta or like fire-made material, plaster, cement, cinder or ashes, or of a combination of the same, or of equally non-inflammable non-heat conducting materials laid between the upper and under floors or occupying all the spaces between the timbers under the under "floor." Second-class buildings of 45ft. or more in height which are used above the first floor for storage purposes must have, instead of the ordinary fire stops, a tight splined or tongued and grooved under floor of at least 2in. plank with an upper floor 1in. thick; staircases to such buildings must be enclosed in walls or shafts of non-inflammable material, with all openings fitted with iron doors.

No space inside any first-class building may exceed 10,000 sq. ft., or in a second-class

building 8,000 sq. ft., without being subdivided by party-walls.

Composite and third-class buildings may only be erected outside the building limits. Fire stops are required to be provided in a similar manner to those in second-class buildings, and no third-class building is allowed to be more than 45ft. in height if a dwelling-house or 55ft. if otherwise, nor to have an external wall nearer than 3ft. or 5ft. respectively to an adjoining lot, unless such wall is built of 12in. brickwork. These requirements do not apply, however, to buildings erected at a distance of 50ft. from any other building and from any other street or way.

The Comparison as regards Height.
These regulations relating to the main outlines of construction, if compared with the few similar provisions existing in our provincial by-laws, appear to touch the extremes of rigour and leniency. While few structures similar to the Boston third-class buildings are allowed to be erected in our provincial towns, yet not even in the Metropolis itself are there such requirements, other than those applicable to public buildings, for the compulsory fireproofing of a large class of new buildings and for special construction to prevent the spread of fire in those of everyday type. No doubt the greater proportion of the best class of buildings in this country are now erected of fire-resisting construction, but entirely at the option of the owners, professional opinion here apparently not having yet reached the point of considering compulsory measures desirable. On the other hand, buildings in Boston can be erected to a greater height than in London, they being allowed to be 2½ times the average width of the street, but in no case more than 125ft. high. Buildings in London in wide streets may be 80ft. to the top of the parapet, with two storeys in the roof—in all about 100ft.

Details of Construction.
When details of construction are touched upon the contrast between American and English provincial legislation, though noticeable, is not of quite such a striking nature. The really essential difference between the Boston regulations of construction in detail and those of the Model By-laws is that, in accordance with the common American practice, tables are given stating the maximum loads that may be put upon various materials, and the existence of this provision enables, without any ill effect, many variations to be made from the detailed regulations familiar to us in our own by-laws. It is possible that the fact of many of the requirements of the Boston building laws being directly based upon scientific principles, and thus open to the investigation of all parties, not only tends to good construction but also to the existence of a more tolerant spirit between architects and surveyors and the municipal officials than is the case where our own hard-and-fast rules prevail. The Model By-laws contain clauses specifying the class of materials to be used, but there is no restriction as to the load which may be put upon any particular material, although it is true that urban authorities who have adopted Part III. of the Public Health Act Amendment Act of 1890 are able to make by-laws regulating "the structure of floors, hearths and staircases."

(To be concluded.)

A Branch Library at Townhill, erected by the Carnegie Dunfermline Trust, was opened recently. The style is English Domestic, with half-timbered gables and projecting roofs, the walls being harled, with a base of red facing bricks. The cost was about £4,000, the plans being prepared by Mr. Peter L. Henderson, of Edinburgh.

ATTIC PLAN

FIRST FLOOR PLAN

GROUND FLOOR PLAN

This house, which is the residence of the architect, has been built of red brick and Thetton stone, with Welsh grey slates on the roof and white frames to the window openings. The whole of the interior woodwork, including the floors, has been treated with "Carbolium" reduced with paraffin.

HOUSE AT EALING, W. WILLIAM A. PITE, F.R.I.B.A., ARCHITECT.

R.I.B.A.

Two Papers on Leadwork.

A MEETING of the Royal Institute of British Architects was held on Monday evening at 9, Conduit Street, W., the chair being occupied by the vice-president, Mr. Edwin T. Hall.

The death was announced of Mr. William Gibbs Bartlett, a member of the Institute for forty-eight years, who was elected an Associate in 1858 and a Fellow in 1869.

Mr. Maurice B. Adams enquired the reason why the Institute was not represented on the Strand further improvement memorial which had been sent in to the London County Council.

The chairman replied that the Council had decided that it would not be wise for them to take any part in that particular memorial, because they had made their own representations to the London County Council and had only quite recently been in communication with the same body with reference to the matter.

A paper on leadwork was then read by Mr. F. W. Troup, followed by one by Mr. Lawrence Weaver, F.S.A.

Mr. Troup said that as the architect had frequently to decide what metals should be used on a building, it was imperative he should know the peculiar properties of each, and why lead ought to be used in one case, cast-iron in another, and pewter or copper in a third. To bring out the most prominent qualities of lead—namely, its durability at ordinary temperatures, its ductility, its exceptional weight, and its low melting-point—the lecturer compared it with other metals in common use, showing its advantages for open-air purposes over copper, tin, zinc, iron, &c. Lead required, however, great care and judgment in its use. As regards the material as now supplied—milled lead and cast sheet—milled lead is a dull and pasty material compared with lead run out in the old way by casting the molten metal on a sand-bed to the actual thickness required for use. Cast sheet can be had in the open market at the present day at a rather higher price than milled sheet of the same weight. For a flat lead roof, often liable to be walked upon, there is not much to be gained from using cast sheets.

The Surface Texture of the Cast Sheet, however, is worth making some slight sacrifice to obtain, especially if the old-fashioned open roll or flat welt-roll can be used. Either of those joints is preferable to the usual modern roll with its wooden core. The wood roll has to be large, and therefore clumsy, else leaks arise from capillary attraction between the sheets. The open roll has not this defect, but cannot stand under much foot traffic. When lead is used on a spire or turret it is certainly worth while to use cast sheet. Even with a wooden core in the rolls the cast sheets do not cause suction to such an extent as milled lead. The natural surface of the lead as it is cast is the best to use as the exposed surface in a roof or elsewhere.

When there is Ornament of any sort to be cast with the sheet, then the under or sand surface must be exposed. This can be as rough as you like for roof or rain-water heads, and a coarse sand may be then used for the casting bed. But for things which come close to the eye, or which may be handled, a much finer sand should be used. More care is then required in the casting to provide for the escape of the steam formed by the molten metal on the damp sand. For a "repeat" ornament or for casting letters and figures for dates a lead mould can be used. This is easily made and lasts for a long time, but a brass or cast-iron mould is more permanent. For knobs and

finials it is possible with a lead or brass mould to fill it with molten lead, and after two or three seconds empty out the interior unsolidified lead, giving a hollow casting without the trouble and expense of making a core as for a brass or iron casting.

For Decorative Forms

the lecturer counselled restraint; lead was so easy to twist and turn. The designer should never forget his material while designing on paper; even in modelling the finer material must never be lost sight of. It is quite possible to make a casting from a single pattern in several different materials, but to take full advantage of the best that can be got out of each material that original pattern ought to be varied in each case. For a plaster cast, for example, moderately high relief may be had; but it should be soft in contour, and there is no special reason for economy in material. In lead, however, there is reason for economy of material, and one can have finer lines, and can reckon on bending, soldering, or even to some extent bossing up the casting after it is made. There are several other ways of ornamenting lead. It is very easy to make fretwork patterns for ventilating panes in windows, or as a vallance round a leaded dormer or door-hood. This is best done with chisels and gouges on a block of lead. Lead can also be incised and the incised lines filled with various coloured mastics in letters or other shapes. One of the most gorgeous possibilities for decoration in lead is to be had by tinning the metal in some design of ornamental or figure decoration, and then glazing over the tin surface with transparent colours.

In the Middle Ages

the chief method of working lead and using it in buildings was simply to take the plain cast sheets, and after cutting it to the outline as near as might be, and in convenient size for handling, to dress, boss and beat it up to the shape required. Sometimes these forms were carried on wooden cores; at other times on a framework of iron, or were simply fixed by iron hooks and brackets on the timber framing. This art is as dead as Queen Anne. It is a personal art like sculpture—very often it was sculpture—and no amount of designing by another for the craftsman to execute will do much to restore it. The art has been so long divorced from the craftsmanship, and the teaching of tradition so long deserted, that their reunion is hardly a matter to be accomplished in a single generation. We can but live in hope.

Mr. Weaver's Paper.

Mr. Lawrence Weaver took for his subject the earlier lead spires. Lead, he said, had no nobler use than in the covering of spires, for spires were the greatest concession that Gothic architecture had made to constructed beauty and symbolism. The lead spire has a character all its own, and maintains a character of a spiritualized roof more intelligibly than a stone spire can do. The white, almost glistening patina which comes with age on lead, where the air is not befouled with smoke, makes the spire stand like a frosted spear against the sky, and the slight twists which almost every timber spire has taken give a peculiar sense of life. Dealing with the history of

Lead Spires,

and discussing the question of origins, the lecturer quoted the classification of spires given by Mr. Francis Bond in his "Gothic Architecture," and gave his reasons for offering the following classification, based on Mr. Bond's, but corrected:—

Pathless Spires—

- (i) Collar-type, e.g., Ryton.
- (ii) Broach-type, e.g., Braunton, Barnstaple, Godalming, Ickleton, Swymbridge, Almondsbury.
- (iii) Pinnacled type, e.g., Long Sutton, St Nicholas, and Aberdeen.

Parapetted Spires—

- (i) Collar-type, e.g., St. John's, Perth, the tower of which has a heavy over-sailing parapet within which the spire stands.
- (ii) Broach-type, e.g., Hemel Hempstead.
- (iii) Straight-sided type, e.g., Harrow, Chesterfield, Minster, Great Baddow, Much Wenlock, Wickham Market.
- (iv) Spirelets, e.g., East Harling, Wenden Ambo, Swaffham, Hitchin, Sawbridgeworth, and Ash, Kent.

A certain difficulty arises in the definition of lead spires owing to the somewhat loose use of

The Word "Broach."

What the lecturer called the "collar-type" is sometimes called "broach," but incorrectly. The essence of the broach he took to be that the filling-in between the angles of the tower and the diagonal faces of the spire shall be of pyramidal form. The influence of the stone broach on the form of the lead broach may be admitted without suggesting that the lead broach was a slavish or unintelligent copy of the stone broach. It was a question of carpentry. The construction of the collar type is more congenial to wood than is the broach. The octagonal framing calls (but not very urgently) for strutting at the base. In the broach the main framing is strutted by single timbers running through the diagonal faces of the octagon; and this is not so satisfactory as the double strutting of the cardinal faces, which obtains in the collar-type. From the weathering point of view the lecturer considered the stone broach to be as efficient as the collar-type, and he felt strongly that the broach was far the more attractive.

Having given details and brought out the chief characteristics of examples of the different types classified, the lecturer made some remarks by way of constructive criticism. His illustrations, he said, had shown how beautiful lead spires can be and are. The lead gave the architect no trouble: he gained infinite variety of surface by different arrangement of the rolls; he outlined great cartoons on the faces of his spires (as at Chalons-sur-Marne) and blazoned them with gold and colours; he wanted the metal-cased architecture of the poets, and he got it. His difficulty was that he could not keep it. The timber framing was always

Liable to Destruction by Fire.

To-day, however, there is an alternative. Our spires can be built in steel and sheathed in lead, and will defy the flames. Here is one field where steelwork may come into its own, may come faithfully and gracefully, may be the metal bones of a metal architecture. The lecturer claimed for it that it preserved the initial idea of a spire that it is a glorified roof; that the lead surface gives opportunities for colour treatment that a stone spire cannot give. Had the mediæval architect found the material to his hand, we should be pointing to-day to his

Leaded Steel Spires

as notable examples of the Gothic spirit. In conclusion the lecturer showed a design for a leaded steel tower done by Sir Charles Nicholson to illustrate his suggestion.

Lieut.-Colonel L. Prendergast proposed a vote of thanks to the readers of the papers, which Mr. H. V. Lanchester seconded. Sir Charles Nicholson, Mr. Harrison Townsend, Mr. Maurice B. Adams, Mr. E. W. Hudson and the chairman also spoke.

Obituary.

Mr. James Brown, builder, of Dundee, died last week. He was 70 years of age.

Mr. Adam Hunter, of the firm of Porter & Hunter, architects, Colwyn Bay, died recently.

NOTES ON COMPETITIONS.

Holborn new Town Hall.

The following are the names of the six architects selected by the Establishment Committee to submit designs for the proposed new offices of the Holborn Borough Council:—Messrs. Colcutt & Hamp, Mr. Edwin T. Hall, Mr. Gerald C. Horsley, Mr. Henry T. Hare, Mr. A. Brumwell Thomas, and Messrs. Warwick & Hall. At last week's meeting of the Borough Council Mr. Lisle moved to instruct the committee to appoint the assessor, but the motion was rejected as premature.

In view of the varied work with which the foregoing names are associated, this competition should be a very interesting one. Mr. Hare and Mr. Thomas are well-known as town-hall architects, and Messrs. Warwick & Hall have presumably been selected by reason of their success in the Lambeth Municipal Buildings competition; the other names, however, have apparently been included as those of prominent architects within the Holborn area, for Messrs. Colcutt & Hamp are more associated with hotel and commercial buildings, Mr. Edwin T. Hall with hospital and asylum work, and Mr. Horsley with churches and domestic buildings—rather than with town halls.

Swadlincote Free Public Library.

Information has been received from a correspondent which affects all intending competitors for the Swadlincote Free Public Library. The list of replies to competitors' questions which has been sent to him by the promoters does not agree with similar lists which have been sent to other competitors. The discrepancy is of such a nature as to affect materially the positions of the entrance and the rooms, and leaves a doubt as to the wishes of the council in reference to the room to be used as for art classes. This is a very serious matter, and a difficult one to deal with. The correspondent suggests that the assessor ought to ignore all requirements except those set forth in the conditions. This seems rather unfair on the competitors, who act in accordance with the replies to queries which they have received, for the "replies" are always regarded as explanatory of obscure points in the conditions, and as the last word thereon. On the other hand, those who have prepared their plans in ignorance of the fuller information will be under an obvious disadvantage when the assessor comes on the scene. Whether he judges the drawings in the light of the full requirements of the council as set forth in the conditions only—which, by the-by, appear to be lacking in information—or of the conditions plus the "replies," injustice will be done to one or the other set of competitors. The only course which seems possible is that every competitor should write to the promoters stating that discrepancies exist, and refusing to compete unless a printed list of replies be received, with an assurance that an identical list has been sent to every applicant for conditions. As, however, the designs have to be sent in by March 24th it seems rather too late now to do anything.

Wallsend Municipal Buildings.

This was a competition which was open to architects whose offices were situated within a radius of 20 miles from the city of Newcastle-on-Tyne. The assessor has recently made his award as follows:—1, Mr. J. H. Morton, South Shields; 2, Messrs. Shrewbrooks & Hodges, Newcastle-on-Tyne; 3, Messrs. Liddle & Brown, Newcastle-on-Tyne.

A sub-committee which was appointed to consider the plans placed first, second and third by the assessor has decided to accept the one placed third "as the basis of the scheme." The sub-committee appears to have been actuated by what it considered as the

superior attractiveness of the elevations of the third design, and on this score it has disregarded the advice—as inferred in his placing of three designs in their respective order of merit—of the prominent architect engaged by the Corporation to act as assessor, and has set aside a scheme which was generally admitted to be superior to the one selected. Unfortunately for the author of the first design, the Corporation in the conditions reserved full liberty of selection, *i.e.*, they did not "bind themselves to carry out any of the designs sent in or to adopt one of the designs which may have been awarded a premium"; premiums were offered only for the designs placed first and second by the assessor. The danger of such a clause as this is not sufficiently recognized by competitors, who are frequently either too optimistic or too thoughtless to ascertain whether the author of the design placed first by the assessor will be appointed to carry out the work, provided he be a suitable person to do so. Promoters are in the habit of guarding themselves against the contingency of having to appoint an architect who might prove undesirable, but in this case they have gone further—they have definitely reserved full liberty of selection. Nevertheless it is to be hoped they will listen to the protests which it is inevitable they will receive, and that they will carefully reconsider their selection, with the assistance of their assessor, so that justice may be done to the author of the best all-round scheme.

A Golf Clubhouse.

The design of Mr. Charles H. Greig, architect, of 6, York Place, Edinburgh, has been placed first by the assessor in a competition for a clubhouse for the Broomieknowe Golf Club, Edinburgh.

Salford Schools.

Mr. J. H. Woodhouse, F.R.I.B.A., of Manchester, has been placed first in the competition for new schools to be erected facing Bolton Road, Salford, at a cost of about £19,000.

Acton Municipal Buildings.

Writing from Kensington Mr. William G. Hunt says: "In your issue of February 7th you state in an article you are kind enough to style 'The Acton Municipal Buildings Farce' that the lowest tender for these proposed works, 'which were expected to cost some £10,000, has come out at some £60,000.' In the following week's issue you intimated that those figures were incorrect, expressed regret for your error, and made an amended statement to the effect that the lowest tender, which was expected to be some £60,000, has come out at 'close upon £100,000.' This statement is also inaccurate, as the lowest tender only amounted to £80,000 odd; the extra amount being fully accounted for by an extension of the site and of the building, and other matters well known to the Council, who approved this tender as submitted, and accepted it subject to the approval of the Local Government Board. I should also like to say that the Acton Council has in no sense been 'led astray' or misinformed by me in the slightest degree, and I am sure neither the chairman nor any of the councillors would suggest that they had. Your article, which is incorrect in other respects also, has just been pointed out to me with a request that I should correct it, otherwise I would not have troubled you with this letter, which I trust you will find space in your valuable paper to publish."

In reply to the foregoing we have to say that our information was based upon a printed report which read: "The district council of Acton at its last meeting decided not to build the town hall. The chairman of the Council at the meeting referred to explained that 'no one was more surprised than he when they found the lowest tender amounted up to close upon £100,000.' He asserted that the Council had been led astray, and

that there was not a member of the Council who had really intended to spend £100,000." We satisfied ourselves at the time by enquiries that this information was correct. By Mr. Hunt's showing, the excess of the lowest tender over the estimated cost is £20,000, not £40,000 as has been stated. We can only express regret that the sources of our information, which we had every reason to suppose were reliable, have been productive of some data which have not proved strictly accurate.

Competitions Open.

The following is a list of competitions open—

DATE OF DELIVERY.	COMPETITION.
Mar. 24	FREE LIBRARY AT SWADLINCOTE (limited to architects practising within 30 miles of Swadlincote).—Premiums of £25, £15 and £10. Particulars from Mr. W. A. Musson, Clerk, Council Offices, Swadlincote.
" 26	WESLEYAN SUNDAY SCHOOLS AT WILLESDEN.—Particulars from the Rev. M. F. Crewdson, 4, Tavistock Road, Harlesden, London, N.W.
" 31	BIRMINGHAM COUNCIL HOUSE EXTENSION (Sketch Plans).—£1 is. deposit for conditions. Particulars from Birmingham Town Clerk, Council House.
" 31	DWELLINGS AT MILAN EXHIBITION.—Premiums £240 and £80. Particulars from the Exhibition Committee, Milan, Italy.
April 2	PUBLIC LIBRARY AT SOUTHWARK (to cost £7,000).—Premiums of £50, £30 and £20. £1 is. deposit for conditions. Particulars from Mr. J. A. Johnson, Town Clerk, Town Hall, Walworth Road, S.E.
" 14	SCHOOL AT OSSETT.—Premium of £50 (to merge). Particulars from the Secretary at the Education Office, Ossett.
" 15	PEACE PALACE AT THE HAGUE.—Particulars from the office of the Carnegie Foundation, Noordeinde 33, The Hague.
May 31	NATIONAL CONGRESS HALL FOR BRAZIL.—Premiums of 15,000, 10,000 and 5,000 milreis (equivalent to about £1,685, £1,125 and £562 respectively). 5,000 milreis also for designs not premiated but desirable to be acquired. The conditions of the competition can be seen at the offices of the Commercial Intelligence Branch of the Board of Trade at 73, Basinghall Street, E.C.
No date	ISOLATION HOSPITAL AT STONE.—Limited to architects in the district. Particulars from Mr. J. J. Chapman, clerk to the Stone Joint Hospital Board, Stone, Staffs.
Date not stated.	BATHS, FIRE-STATION AND FREE LIBRARY AT REDDISH.—To cost £5,000. Applications by March 31st to Mr. Robert Hyde, Town Clerk, Stockport, for form of instructions to architects. Deposit £1 is.

Enquiries Answered.

The querist's name and address must always be given, not necessarily for publication.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

Unarticled Clerks and Examinations.

NEWPORT.—E. R. J. writes: "Are unarticled clerks in architects' offices allowed to enter for examinations?"

Yes, certainly. Neither the Royal Institute of British Architects nor the Society of Architects raise any objections.

Adjoining Owners and Projecting Mouldings.

QUERIST writes: "A and B are two business premises adjoining. B requests A to remove the return ends of mouldings on new wooden pilaster to shop front, which project on to B's front about 1½ ins., or pay an acknowledgment, as he submits they acquire a right if allowed to remain. Is this so, and if B can compel A to remove the ends of the mouldings can A compel B to remove the projecting cornice over his roof? They are both old buildings, but A has recently put in a new shop front—hence the request."

B is certainly within his legal rights in asking A to remove the portion of the newly-

built pilaster which overlaps his premises; however small the overlap, it forms an encroachment on A's part. Whether A can similarly require B to remove his overhanging cornice depends on the period of time that the cornice has so projected. If it has been in existence for a period of twenty years (practically nineteen years and one day is sufficient) B has acquired a prescriptive right to maintain the cornice as it now exists, and cannot be compelled to remove it (2 & 3 William IV., c. 71, sec. 2). F. S. I.

Cost of Mission Halls, Sunday Schools, &c.

E. S. writes: "What is a fair price for this class of property at per foot cube in the suburbs of London, exclusive of seating; also what is the minimum price for the cheapest class of sound building, and also for buildings with a reasonable amount of finish externally and internally? Also the price per person. I have given an approximate estimate for this class of building, built of brick and plastered internally, with varnished pitch-pine open-timber roof and boarding, which works out at 6d. per ft. cube, but I am informed by my client that similar buildings have been erected for a much smaller sum."

It is impossible to reply very definitely to the above question without knowing particular circumstances, but we may say generally that 6d. per ft. cube is about the lowest for which buildings of this class can be erected at the present time.

Designing Columns and Stanchions.

HORSHAM.—STUDENT writes: "Assuming that the weight to be carried by a column or detached stanchion is 60 tons, and that the length of the column is 10ft., what section would you use? For a column 2 tons to the inch, and for a stanchion $1\frac{1}{2}$ tons, may be assumed the safe weight. Is the following working correct? For a column: If 2 tons per sq. in. is the safe load and 60 tons has to be carried, we require 30 sq. ins. of metal. According to Adams, to carry 2 tons per sq. in. the column must be 20 to 25 diameters. Hence, if height is 10ft. the diameter will be about $\frac{10 \times 12}{20} = 6$ ins. This seems rather an

absurd result, and the safe load given seems insufficient. I should be glad if you would give me a method of calculating stanchions or columns when a safe load such as the above is given."

The safe load per square inch being given as 2 tons per sq. in. for the column, a load of 60 tons will require 30 sq. ins. sectional area. At 2 tons per sq. in. it may be 20 to 25 diameters long, and the height being 10ft., $\frac{10 \times 12}{20} = 6$ ins. to 4'8 ins. diameter; but 20 to 25 30 sq. ins. area will not be reached with less diameter than $6\frac{3}{8}$ ins., which would be the size to adopt for a solid column. Querist apparently misunderstands the table given in "The Practical Designing of Structural Ironwork" (Spon, 8s. 6d.). It is there shown that a cast-iron hollow column 20 to 25 diameters high should not be loaded to more than 2 tons per sq. in., which is very different from saying that a column loaded to 2 tons per sq. in. must be 20 to 25 diameters high. For a check upon the $6\frac{3}{8}$ in. diameter solid column reference may be made to the table, p. 36, in Spon's "Builders' Pocket Book" for 1874, where the safe load on a cast-iron solid column 6 ins. diameter and 10ft. high is given as 50'51 tons, or 1'79 tons per sq. in. For a cast-iron stanchion to carry the same load at $1\frac{1}{2}$ tons per sq. in. the sectional area would be $\frac{60}{1\frac{1}{2}} = 40$ sq. ins., or say a cross-shaped section about 12 ins. by 12 ins. by $1\frac{1}{4}$ ins. thick. But with this section and only 10ft. high a greater stress than $1\frac{1}{2}$ tons per sq. in. could be put

upon it. It appears as if the question has been framed to discredit the tables, but the above explanation should put the matter right.

HENRY ADAMS.

Rights of Light.

BIRMINGHAM writes: "A and B are neighbours. A has recently re-erected buildings at the rear of his property, and about four years ago built on a piece of the yard in front of his old kitchen and erected thereon a room, which is shown as the hall on the accompanying plan (not reproduced). The kitchen was then built on the first floor, the old kitchen was converted into the shop, and the window which in the old kitchen was in the outer wall was converted into a borrowed light for the shop, owing to the hall being built in front of it. B now objects to A's property being seen and overlooking his garden, and wants to raise the wall. A objects, as he knows that the light to the hall will be interfered with, and he claims further that he has a right to the ancient light to the old kitchen window, also to another which has existed in the old building for at least fifty years, and which A has recently rebuilt. Has B the power to raise the wall higher by using his half of the wall, without A's consent? Assuming that B can raise the wall on his half, can A claim compensation for injury to light? There is a clear air-space of 4ft. 6 ins. and 7ft. 6 ins. respectively from the face of A's building to the boundary wall. What is the extreme limit that A could build without hindrance from B?"

A is clearly in the wrong, and should settle his dispute with B as speedily as he can, and on the best terms he can get. A's "ancient light" consisted merely of the one old kitchen window on the ground floor; he appears to have retained that window where it always was, and to have added no fewer than nine other windows, all overlooking B's property. If B chooses to erect an obstruction to all these new windows (taking care he does not block the original one) he is quite entitled to do so, because A's prescriptive right of light is limited to the old window, and only the old window. It is questionable whether B possesses the right to build upon

one moiety of the party-wall, but I strongly advise A to allow him to do so for fear a worse thing befall him.

F. S. I.

Trussed Rafter Roof with Coved Ceiling.

SUFFOLK.—STUDENT writes: "Kindly give your opinion as to the safe and sound construction of the roof shown by the accompanying drawing. The total length of the wall-plates and girder is 18ft. The girder proposed is 10 in. by 5 in. r.s.j. built 9 ins. in brickwork at ends, and with 4 in. by 3 in. plates bolted to web, and the bottom flange bolted to 5 in. by 3 in. head of stud partition. The walls are 11 ins. hollow, with windows in centre. A coved ceiling is to be formed with 11 in. by 1½ in. stuff, cut to curve and spiked to collars and rafters respectively. The collars are to be framed to rafters, the gutter bearers linking two roofs as shown."

The distance apart of the trussed rafters is not stated, but assuming them to be 12 in. centres and allowing loads of 28 lbs. per ft. super. vertical and 28 lbs. per ft. super. normal to slope of roof for wind on one side, the loading will be as shown on frame diagram, Fig. 1, for which Fig. 2 is the corresponding stress diagram. It will be seen that the roof does not form a complete truss, as a king-rod, 9 - 9a, is required in order to complete the stress diagram. If a king-rod is inserted the collar may remain 4 ins. by 2 ins., but if the roof is made as Fig. 3, then the collar should be increased to 6 ins. by 2 ins. to resist the bending moment caused by the curved ties. The outer walls supporting roofs appear to consist of two 4½ in. walls with a 2 in. cavity between. These will not be strong enough. They should be increased to a 9 in. inside wall, 4½ in. outer shell, and 2 in. cavity. The girder carrying the roof-valley will have a distributed load of about 7 cwt. per ft. run, and for a span of 18ft. will require a 10 in. by 5 in. by 35 lb. rolled steel joist, with not less than 1 sq. ft. of bearing surface at each end. The 5 in. by 3 in. head of stud partition should not be bolted to the bottom flange of joist, as the holes will weaken it considerably. A better way will be to use 2 in. by ½ in. clips (as in Fig. 4) screwed to the sides of 5 in. by 3 in. head and turned over the bottom flange of the joist.

HENRY ADAMS.

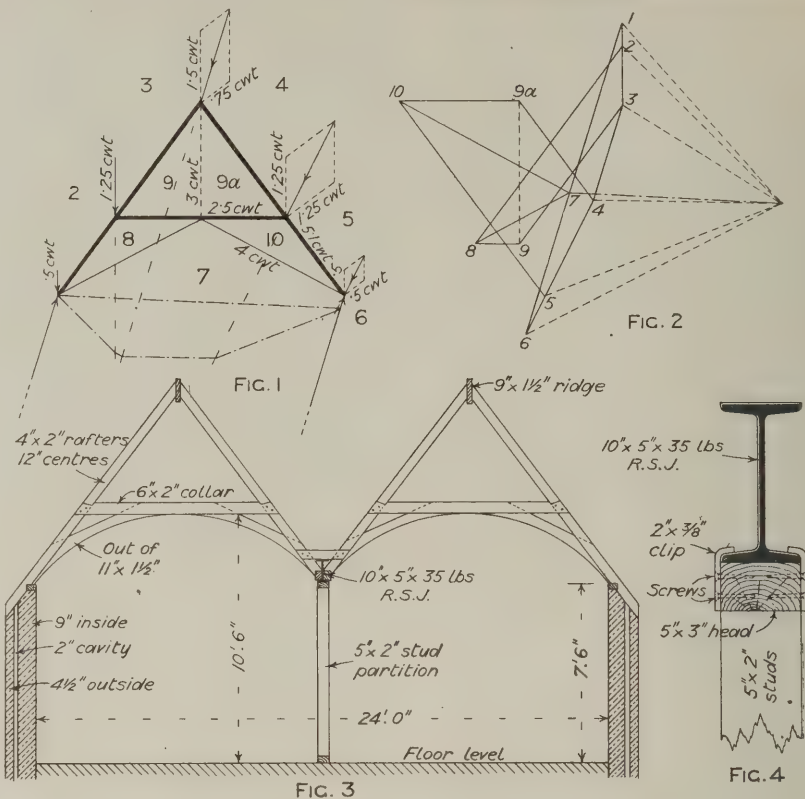

FIG. 3
TRUSSED RAFTER ROOF WITH COVED CEILING.

MORTAR.*

By S. SMITH.

FOR the making of mortar the limes in most general use are those which are obtained from the limestones containing the largest proportion of pure lime.

After being quarried and broken up into small pieces the limestone is burnt or calcined in a kiln. The effect of this burning is to drive off the carbonic acid gas and water, which combine with the lime to form limestone. If the heat be too suddenly applied to the limestone, it becomes "slagged," or covered with a silicious glaze, and is thereby rendered useless for the purpose of making a mortar; on the other hand, if the lime be overburned, that is to say, if the burning is continued after the carbon dioxide has all been driven off, it is difficult to slake, some of the parts only slaking after the lime is in use. Mortar made from an overburned lime is unreliable, and in some cases causes damage through the unslaked particles becoming slaked after a time, then swelling up and bursting the wall. When properly burned the limestone loses all its carbon dioxide and moisture, and is converted into caustic or quick-lime (protoxide of calcium), 100 parts of raw stone yielding on an average from 50 to 60 parts of burnt lime. The caustic lime is next slaked with water (1 volume of water to 3 volumes of lime), when it evolves much heat and crumbles down into a greyish, bluish or brownish coloured powder (calcium hydroxide), according to the original colour of the limestone. When sand and more water have been added to this powder it is converted into a pulp or paste, and in this form is used as a mortar.

Setting of Mortar.

When mortar is exposed to the air it becomes hard, this being what is termed the indurating or setting of the mortar. In the common or air-setting limes, as distinguished from the hydraulic limes, or limes that will harden or set under water, one of the causes of setting is the absorption of carbon dioxide from the atmosphere by the lime, and the formation thereby of a carbonate of lime; that is, reconverting the lime from a caustic or slaked lime back to a limestone. This is assisted to a certain extent by the water which is part of the mortar acting as a solvent for the carbon dioxide. As can be readily understood, this process is a very slow one in the case of mortar used for building purposes. In old buildings where the walls were thick, and a fat or pure lime had been used as the mortar, part of the lime in the middle of the wall has been found to be still in the form of hydroxide, even after the lapse of centuries. It is only within the last century that any investigation has been made into the cause of lime-mortar becoming hard, or set. A German scientist made experiments with mortar, drying it over a hot-water bath, and he found that, after all the water had been evaporated from or dried out of the mortar, there was nothing left but a powder composed of lime and sand; thereby showing that it was not by evaporation of the moisture that the lime became hard.

From further experiments he found that on the addition of carbon dioxide the lime quickly set and became hard. On examination of mortar which has fallen for some distance, such as may be seen on a projecting course, or along the line of the wall of a new building, it will be found that this mortar has set far quicker and is far harder than the mortar that had been built in the wall. The same applies to mortar used in pointing a wall. When the mortar used for pointing is thrown from the trowel into the

joint between the stones it becomes far harder than if it is merely pressed in by the trowel. The increased power of setting possessed by mortar which has fallen from a height, or that has been thrown from a trowel, is caused by the lime in its passage through the air having taken up a considerable quantity of carbon dioxide while the lime was in a sufficiently moist state to act as a solvent of the gas; the crystallization of the particles of the carbonate formed being thereby accelerated. A further practical proof of the action of carbon dioxide in the setting of mortar may be seen in connection with the lime used for plasterwork. In many cases the same lime is used for the plasterwork as has been used in the building of a house, the plaster lime, which is put on in three coats, being as a whole very little more in thickness than some of the layers of mortar in which the bricks or stones are embedded. There is this difference, however: in the one case it is the broad or large surface of the mortar which is exposed, while in the other it is the narrow or thin edge. If the wall of a new building is cut into, the mortar with which it is built will be found to be quite soft and friable, while the plaster has become hard and dry, although the mortar used for the plasterwork has been prepared weeks, and in many cases months, after that used by the builder. The reason for this can be readily understood when it is considered that in the one case the large surface would be exposed to the atmosphere at three successive periods, and would thereby absorb a large quantity of carbon dioxide, whereas in the other only a very small surface of the mortar would be exposed, and therefore a proportionately small quantity of the carbon dioxide would be taken up, and the setting of the mortar would be relatively slow.

When the action of the carbon dioxide is understood a better knowledge of the use of sand in the setting of mortar is obtained. All practical men know that a fat or rich lime never hardens unless it is mixed with sand. If a plasterer were to put on his finishing coat of putty or fine stuff, that has been made up into a pulp with water, without an admixture of sand or plaster-of-Paris, it would dry, but would never become hard as would a coat of putty which had been mixed with clean sharp sand. The particles of sand form channels for the carbon dioxide to filter through, thereby letting it act upon all the particles of lime from all sides at the same time. The sand also serves as a base for crystallization, thus assisting in a practical manner in the formation of carbonate of calcium. Sand, therefore, serves a useful purpose in mortar, in addition to counteracting the shrinkage or contraction in drying which takes place in a mortar made of pure lime. Sand, being mainly composed of silica, also assists in the setting of the mortar by a chemical action taking place between the hydroxide and the silica: the result being the formation of a silicate of lime. This silicate forms a base upon which the crystals of carbonate previously referred to are formed.

Different Kinds of Lime.

It is rarely that what may be termed pure lime is used for the purpose of making a mortar. That which is commonly used, and which is derived from ordinary limestone, contains, in addition to lime, a number of other substances, such as oxide of iron, sand, alumina, magnesia, oxide of manganese, &c. During the operation of burning, some of these substances combine with the lime, and the lime thus acquires properties which it would not otherwise possess, some of these being advantageous and of assistance in the setting of the mortar. Take, for instance, an ordinary lime and make it into a paste with water, then put it into a dish and cover it with water. The mixture will always remain moist and soft,

even although sand be added. The resulting mortar, if treated in the same manner, will always remain soft. There is another kind of lime, however, which if treated as described above, will harden under water more or less quickly, according to the substance of which it is composed. If the lime be mixed with sand and made into a mortar, and then placed in a similar position, it will also become set or hard. If once a lime of this description has been made into a paste and allowed to dry or harden, it cannot be again softened up the same as mortar made from ordinary or common lime. The name "hydraulic" is given to limes of this description.

On slaking lime fresh from the kiln it is considerably augmented in bulk, this augmentation in some cases being such that 1 volume of lime will yield 3 or 4 volumes of slaked lime. The lime which possesses the property of setting or hardening in water does not increase in bulk when slaked, or at least very little. As a general rule the more "hydraulic" a lime is the less it increases in bulk. Till the early part of the nineteenth century the limes which slaked slowly and increased little in bulk were termed "meagre" limes, this term being applied indiscriminately to all limes, whether they possessed the property of hardening under water or not, and the limes which increased largely in bulk on being slaked were termed "fat" limes. About that period the term "hydraulic" lime was adopted for the limes which slaked slowly and hardened in water; "meagre" for the limes which slaked slowly but did not harden in water; and "fat" for the lime which slaked quickly and gave a large increase in bulk. One writer defines them thus:—

When rapidly falling to quicklime they are rich; when falling only after eight or ten minutes they are poor; when they require fifteen or twenty minutes they are medium; when they require an hour or more they are regarded as hydraulic; and when requiring, it may be, several days to break up they are highly or energetically "hydraulic."

Burnell in his book on limes, cements, mortars, &c., gives the following definitions of the various limes and the cause of lime being hydraulic:—

(1) "The pure calcareous rocks, or such as contain only from 1 to 6 per cent. of silex, alumina, magnesia, iron, &c., either separately or in combination, give rich limes on being burned.

(2) "The limestones containing insoluble silica in the state of sand, magnesia, the oxides of iron and manganese in various respective proportions, but limited to between 15 and 30 per cent. of the whole mass, yield poor limes.

(3) "The limestones containing silica in combination with alumina (common clay), magnesia and traces of the oxides of iron and manganese in various respective proportions, but within the limits of from 8 to 12 per cent. of the whole mass, yield moderately 'hydraulic limes.'

(4) "When the above ingredients are present in the proportion of from 15 to 18 per cent., but the silica in its soluble form always predominating, the limestones yield a 'hydraulic lime.'

(5) "When the limestones contain more than 20 and up to 30 per cent. of the above ingredients, but with the soluble silica in the proportion of at least one half of them, the limestones yield eminently 'hydraulic limes.'"

It will be seen from the foregoing descriptions of the materials of which the various kinds of lime are composed that there is a large quantity of silica and alumina in the limes that are eminently hydraulic, the silica being soluble. The first effect of burning a limestone containing these ingredients is to expel the carbonic acid; the second is to effect a combination between

* A paper read before the Architectural Section of the Royal Philosophical Society, Glasgow, January 15th, 1906.

the lime, magnesia, &c., and a part of the silica or the silicate of aluminium. The other portion of the silica remains uncombined until it is brought into contact with lime in the presence of water, when it unites with the lime held in aqueous solution.

The setting of hydraulic limes is the result, therefore, of a combination between these various substances, which commences during the burning or calcination of the limestone and is completed by these compounds becoming hydrated, through being mixed with or being brought into contact with water, with the result that they become crystallized, reacting back to their original form as nearly as possible, namely, that of a stone. When the lime is of an eminently hydraulic nature the assistance of the carbon dioxide is not required during the process of setting. The blue lias lime of England is the main repository of water-setting or hydraulic limes in Great Britain, but available beds also occur among the carboniferous limestones of Flintshire, Northumberland, Lanarkshire (Arden), East of Fife (Blebo), and in the Lothians at Dunbar, Cousland and other places.

The "hydraulic" lime with which, in Glasgow, we are most familiar is that known as Arden lime, and there is also a limestone at Calderwood from which Roman cement was made.

The following is an analysis of the limes got at Arden and Calderwood:—

ANALYSIS OF NATURAL HYDRAULIC LIMES.

	Roman cement.	Arden lime.
Lime	48.44	45.64 to 43.00
Silica	17.90	33.40 " 33.70
Alumina	12.12	6.69 " 6.64
Magnesia	1.92	1.37 " 1.72
Oxide of iron	9.68	2.92 " 2.64
Carbon dioxide	7.15	7.95 " 6.10
Sulphur trioxide	—	1.05 " 2.19
Phosphoric acid	—	.09 " .12
Moisture	.05 to 2.00	.48 " .66

When the buildings of the Andersonian College, Glasgow, were being taken down it was found that a hydraulic lime had been used in the foundations. I had a piece of this analysed and have preserved another part of it. The analysis showed it to be a mixture of Roman cement and sand in the proportion of 1 part of cement to 1 of sand. Alterations were made on these buildings in 1836, and in all probability this lime was got at Calderwood. The mortar of which the remainder of the wall was built was ordinary fat lime mortar, and was very friable and rotten, whereas the hydraulic mortar is in a first-class state of preservation.

Artificial Hydraulic Lime.

While the hydraulicity, or power of setting under water, is natural to some limes, it may be imparted to all (or nearly all) by the artificial addition in proper proportions of clay, oxide of iron, and other ingredients. Smeaton experimented with mixtures of various substances, mixing them together previous to their being made into mortar. Each individual lime requires its own quantities of the various ingredients, but the following may be taken as the quantities of the main ingredients:—

Lime,	50 to 80 per cent.
Clay,	25 to 40 "
Iron oxide,	3 to 14 "

M. Vicat, a French engineer, found as the result of his experiments that the best artificial hydraulic lime was to be had by the grinding-up of the various ingredients together, allowing the mixture to dry, then calcining it and regrinding it to powder; the burning of the various ingredients in this form having the same effect as the burning of a natural limestone composed of these ingredients. M. Vicat established a work near Paris for the manufacture of artificial hydraulic lime. This factory may be said to have been the forerunner of what now

constitutes the important industry of Portland cement manufacture.

[At this portion of his paper Mr. Smith dealt with the details of Portland cement manufacture, tests, &c., but as these particulars have already been given at length in our columns, notably in Mr. Bamber's paper (see issues for January 4th and 11th, 1905), we omit them here.—Ed. B.J.]

Sand and its Substitutes.

As has already been mentioned, sand is essential to the setting or indurating of fat or rich limes. A further process is served by the use of sand in mortar prepared from a rich lime, namely, that of keeping the mortar from shrinking. The pastes of fat lime shrink to such a degree in hardening that they cannot be used as a mortar without an admixture of sand.

Sand is a product of the decomposition of rocks. In a great many cases this decomposition is caused by the action of water on the rock. The sand is carried away by the water, and by the same means is washed clean and free of the clayey matter which also forms part of the rocks. As a result of the geological changes which have taken place at various times on the crust of the earth large quantities of sand have been deposited in places where there are no water-courses or streams at the present time. The sand found in these deposits is termed "pit" sand, to distinguish it from "sea" sand—or sand found on the seashore, and river sand—sand taken from the beds of streams.

As a general rule in pit sand the particles are sharper and not so round in shape as the sand found on the seashore or in the beds of streams or rivers. Where, however, the sand has been deposited by the action of the wind the particles are found to be very fine, nearly as fine as particles of dust, and almost perfectly round in shape. Examples of this latter kind of sand may be seen in the sand-hills on the links that are so plentiful along our coasts. Sea sand, although perfectly clean and what is termed "sharp," should not be used in mortar for house-building purposes because it contains a considerable quantity of magnesium chloride, which is deliquescent and very sensitive to moisture, with the result that walls which have been built or plastered with mortar in the preparation of which sea sand has been used continue to give evidence of being damp. It has been suggested that this may be overcome by the "washing" of the sand in fresh water. Part of the salt will be removed by the sand undergoing the process known as washing, but repeated washings are required before the salt can be wholly taken out of or separated from the sand. This entails considerable expense and is seldom or never done, so that it may be taken as a rule that there should be no sea sand in mortar which is to be used in connection with house building.

The same objections do not apply to the use of sea sand in mortars used for other purposes than house building, and in work such as outside cement work.

River sand, or sand deposited on the beds of streams or rivers by the flow of the water, is, as a general rule, "clean"—that is, free from mud or clayey matter. The same causes, however, which have made it clean have also contributed to the rounding of the edges of the grains or particles of which it is composed. The sharper the sand the stronger or better the mortar. This condition is to be met with in pit sands, especially in sands that are deposited near where they have been formed, and where the action of the water has been sufficient to cleanse them without causing enough friction to make the particles round in shape. In some cases the deposits that have been made subsequent to the deposit of sand have had a deleterious effect on what otherwise fulfils the conditions of a good sand for the purpose of making a

mortar. For instance, there may be a deposit of peat on top of the sand, and the water, percolating to the sand, carries with it a quantity of peaty matter, which covers the particles of sand with a fine film or skin of mud. This skin prevents the air from passing through the mortar as previously described, and also prevents the crystallization of the lime and the formation of the silicate, to which reference has also been made. The deposit also may have been made too near the place of decomposition to allow all the clayey matter to be washed off the grains of sand, with a similar result.

The appearance or colour of the sand is no guide to the quality, as the colour varies according to the kind of rock that has been decomposed.

A rough-and-ready test of the presence of clayey or earthy matter in sand is to take a small quantity of the sand and rub it between the palms of the hands. The clayey matter adheres to the hands, the thickness of the coat of clay adhering being a guide to the quantity of clayey matter in the sand. A better test is to take a glass measuring cylinder, and fill it half full with sand, then add water until the sand is saturated and the water rises in the glass well clear of the sand. Stir the mixture thoroughly, then allow it to settle, when the coarser or heavier grains or matter will be seen at the bottom of the glass, the layers of sand gradually getting finer until at the top a layer of mud is seen and above that clean water. The proportions of the various materials of which the sand is composed can be exactly estimated by this method.

FIG. 1.

FIG. 2.

The proportion of about 5 per cent. of mud shown by Fig. 1 are those of a pit sand in common use in Glasgow.

The sample shown by Fig. 2 is that of a fine pit sand. On being tried by the ordinary method of rubbing a small quantity between the hands it appeared to be perfectly clean. When it was washed the proportion of mud was found to be 28 per cent. The mortar that was made with Arden lime and this sand never set, in consequence of each particle of sand being coated with a fine layer of mud, which effectually prevented the lime from crystallizing on the sand.

It may be stated that although the terms 5 per cent. and 28 per cent. are used in connection with the proportion of clay to sand they are not strictly accurate, as it is by measure that they were determined and not by weight. If they had been determined by weight the percentage would have been very much lower. An American writer recently stated that a mixture of clay to the extent of 12 per cent. was beneficial to the mortar, but quite the contrary has been the experience of

the author, as he has always found that the cleaner the sand the better the mortar.

A sand in which the grains are not of a uniform size is found to give the best result when mixed with lime to form a mortar. The writer had an opportunity recently of examining pieces of mortar taken from buildings which were erected during (1) the eleventh century, (2) the thirteenth century, (3) the fifteenth century, (4) the seventeenth century. Nos. 1, 2 and 4 were built adjoining each other, No. 3 being separated from the others by a distance of about a quarter of a mile. There is a limestone of a rich nature, native to the district, which has been quarried from time immemorial at various points ranging from a mile to a mile and a half distant, so that we may assume that the limes used on all the buildings came from the same place. In 1, 2 and 3 the sand used appears to have ranged in size from pebbles the size of a pea to very fine grains, while in 4 the sand was uniform in size, something like the largest that would be passed by a sieve with 400 meshes to the square inch. In 1, 2 and 3 there were also to be seen small fragments of shells. The mortar in 1, 2 and 3 still serves the purpose for which it was intended, that of binding the stones together, while that in 4 has no cohesion and can be raked out of the beds and joints of the masonry like loose sand.

The author had the experience of the use of a mortar in which the sand used for the mixing of the lime (ordinary rich lime) was almost entirely composed of small shells and particles of shells. The quantities used were from 2 to 3 parts of sand to 1 of lime, the result being a short brittle mortar, which set very rapidly with a hardness and a cohesion equal to that of Portland-cement mortar. The reason for this is, that these shells, being irregular in form and corrugated, would afford every facility for the induration of the lime.

From the foregoing results we may conclude that the best sand to use with rich lime is a clean sharp-grained sand, the grains being of various sizes, preferably having an admixture of shells. The same description and quality of sand will be found most suitable for use also in the preparation of hydraulic lime and cement-mortars.

In cities and in many rural districts great difficulties are experienced in getting a sand suitable for mortar, and various substitutes are used. The Romans used burnt clay, broken into small pieces. In India at the present time old bricks are pounded up and take the place of sand in mortar, with the best of results. In this country engine ashes are largely used, and where the ashes have been burned to a clinker a good mortar can be prepared from a mixture of ashes with lime and sand. At a building the erection of which the author superintended several years ago the mortar was made from what is known as "small" Irish lime, in which there was the refuse or ash from the coal with which the lime was burned, engine ashes and the shivers or refuse from the sandstone used for the building. The mortar was mixed in a mortar mill, the result being a good mortar which set or indurated quickly and became very hard. The author has a piece of lime-mortar composed of 1 part of Arden lime (a ground hydraulic lime), 1 part of engine ashes, and 1 part of white sandstone shivers, all ground up together in a mortar mill. The mortar prepared from this mixture set very quickly, with great hardness and strength. When we look at the composition of the various materials used in these mortars the cause of the improvement in setting is easily explained. The ingredients of coal-ash (Scotch coal) are given as—

Silica	-	-	-	-	37.6
Alumina	-	-	-	-	52.0
Lime	-	-	-	-	3.7
Magnesia	-	-	-	-	1.1
Acids	-	-	-	-	5.02

99'42

The shivers may be taken as consisting of—

Silica	-	-	-	90.5
Iron	-	-	-	3.5
Carbonate of lime	-	-	-	4.8
Water and inorganic matter	-	-	-	2.2
100.0				

The silica in the ashes and shivers would supply the necessary part of sand to counteract shrinkage, while the alumina, iron and magnesia would all assist in forming the conditions requisite to a highly hydraulic or self-setting mortar.

Black sand, or the spent sand from a foundry, forms at times one of the ingredients of a lime-mortar, but is looked upon with suspicion by a great many of those who are connected with the building trade as being likely to lead to the formation of an inferior mortar. These suspicions are not well founded. There is a certain amount of clay mixed with the sand before it is used in the foundry which, if not properly calcined, would have a bad effect on the mortar mixed with it. The clay, however, through coming in contact with the molten metal while in the casting pit becomes calcined, and is brought into that condition which makes it fit to be used in the preparation of a mortar. The sand also gets permeated with a small quantity of the iron, with a beneficial result. The chief objection which the author has to the use of black sand is its uniformity of fineness and its "fatty" nature, which tempts the unscrupulous user to mix with the lime a quantity of sand quite out of proportion to that required, with correspondingly bad results.

Smithy ashes, which contain scales of iron, are also used when a specially hard lime-mortar is required for pointing or such like purpose. Before the time when Portland cement came so largely into use floors were formed with a concrete consisting of smithy ashes and lime-mortar. "Mine dust" or refuse from the ironworks was also put to the same use as smithy ashes; the mine dust, when mixed with lime, making a very hard-setting mortar.

Proportions of Ingredients in Mortar.

A common specification of the relative proportions of lime and sand of which a mortar is to be composed, when the lime proposed to be used is a "fat" lime, is 1 of lime to 3 of sand. These proportions may strike the "happy medium," but in some cases, where the lime, although it may be classed as a "fat" lime, is of a sandy nature, the quantity of sand specified will be too large. On the other hand, where the lime is of a very rich or pure nature, which bulks largely on being slaked, the quantity of sand may be too small.

An American writer (Gillmore) on the subject of limes and cements gives as the quantity of lime in proportion to the sand as the amount of lime that is required to fill up the voids in a known volume of sand plus 45 to 50 per cent. of that amount to allow for shrinkage of the lime. The coarser and the cleaner the sand is, the more lime will be required to fill up the voids, so that it is more economical to use sand which varies in quality of fineness. This may be the accurate method of determining the proportions of sand and lime, but for everyday work the sand, as we have already seen, should be clean and of varying degrees of fineness, and the quantity mixed with the lime should be sufficient to open, or, as it is termed, cut it up, but not enough to make it short and brittle when it is made ready for use. Experience of the various limes will guide the user as to the amount of sand required with the lime to make a good mortar.

In mortars made from hydraulic limes and Portland cement sand is not necessary to the hardening of the mortar, but is used for reasons of economy, and the strength required is the determining factor in the proportions in

which sand is to be used. For ordinary building purposes, sand in the proportions of 2 parts by measure to 1 of hydraulic lime, or 3 parts of sand to 1 of Portland cement, will yield a satisfactory mortar.

Slaking of Lime.

The next step in making a mortar, after having decided on the proportions of lime and sand that are to be used, is the slaking of the lime. The general and most convenient method is to spread out the quicklime in a heap, say 12 ins. in depth, breaking the larger pieces to bring them all to a uniform size. Surround the heap with sand and pour on a sufficient quantity of water to reduce the quicklime to powder, then cover it up as quickly as possible with the sand. This is often done very carelessly, with the following results:—Some of the lime will have got too little water, leaving it still unslaked, and if it be immediately made into a mortar, and used in the building of a wall, it slakes there, in some cases bursting the wall asunder, and breaking the stones with which it is built. On the other hand, some of the lime may get too large a share of the water, with the result that it becomes what is termed "drowned," which has a very bad effect on the strength of the mortar, as will be shown later.

What the author has found to be the most satisfactory method of slaking quicklime is to have the sand and lime lying convenient to the place where it is proposed to slake the lime. In selecting a suitable place for slaking lime a piece of ground as dry as possible should be chosen, and in such a position that water from the surrounding ground or buildings cannot run on to it. More lime is damaged by water getting at it at ground level than by rain falling on top of it. Having selected a suitable place, a layer of lime about 2 ft. wide and from 6 ins. to 8 ins. deep is spread across it, the larger pieces being broken up as mentioned before. Water is sprinkled on this layer, and one of the sides and the two ends are covered with sand; another layer of lime, of the same depth as before, is put on top and the operation of sprinkling repeated, and other layers added and sprinkled in succession until a height of about 3 ft. is reached, when the top is covered with sand. A layer is then put on the ground in front of the last, and so on until the whole of the lime is slaked. Hydraulic limes do not slake readily on the application of water; the more highly hydraulic the lime is, the more difficult it is to slake, therefore the major part of the hydraulic limes are reduced to powder by grinding by the same process as that adopted for Portland cement in preference to slaking.

Rich limes should not be made into a mortar until at least seven days after slaking, to allow the particles of quicklime to become thoroughly slaked. A rich lime may be kept for an indefinite period of time, provided it is kept moist and the air does not get at it to vitiate it by providing carbon dioxide. When lime is not to be used for some weeks or months after slaking, a good method of preserving it is to moisten a small quantity into a paste and cover the heap with this, which will form a smooth skin on the outside and protect the lime from the effects of air and rain.

Hydraulic lime should be used immediately after grinding, as the carbon dioxide which it absorbs from the atmosphere has a deleterious effect on it, tending to bring it into a condition similar to that of a rich lime. All ground limes, however, are not hydraulic limes, or are only feebly hydraulic, and contain a large proportion of pure lime. Limes of this description should be air-slaked for a short time before being used as a mortar, to allow the increase of bulk to be formed. Some builders overcome this difficulty by mixing the lime and sand together twelve hours or so before using.

(To be concluded next week.)

Correspondence.

Action of Plaster-of-Paris on Iron.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—In reference to your comments on my remarks upon the chemical nature of plaster-of-Paris which you were good enough to publish on p. 126 of your issue for March 7th, I must ask to be allowed to make a brief reply to dispel the impression that I deny that iron in contact with this substance is often corroded. Such denial would of course be quite fatuous. My contention, however, remains that this corrosion is not due to the plaster-of-Paris itself, but to other causes such as the presence of air and moisture, and possibly to extraneous substances which various plasters with a base of plaster-of-Paris may contain. I would suggest that you put my contention to the test by keeping under examination some powdered plaster-of-Paris and some selenite or gypsum which has the composition of the slaked plaster-of-Paris in a clean iron box in a dry atmosphere.—Yours truly,

LONDON. ALAN E. MUNBY.

[Our readers will remember that Mr. Munby's original letter was written with the object of defending plaster-of-Paris (and patent plasters using this substance as a base) from the aspersions that Mr. W. W. Kenly cast on it and them. Mr. Kenly gave several practical instances where iron in contact with plaster-of-Paris had been badly corroded. Mr. Munby's defence seems to us somewhat beside the question at issue, which is related to practical conditions. The great power which plaster has for absorbing moisture is well known, and putting aside the question whether this causes gypsum to chemically interact with iron—a matter that seems to us to warrant investigation—we think this power makes it reasonable to hold that plaster can assist in the promotion of rust. The following are our reasons for this statement:—The rusting of iron consists in oxidation of the metal to the condition of hydrated oxide. This, however, does not take place at ordinary temperatures in dry air or in moist air free from carbon dioxide. The combined action of moisture and carbonic acid is necessary. Ferrous carbonate is first formed; this is at once oxidized to ferric oxide, and the liberated carbon dioxide acts on a fresh portion of metal. Once started the corrosion proceeds rapidly, perhaps on account of the galvanic action between the oxide and the metal. Prof. Spencer B. Newbury, an authority of universal reputation on the chemistry of cements, states that water holding carbonic acid in solution rapidly attacks iron. "In lime-water or soda solution the metal remains bright. The action of cement in

preventing rust is now apparent. Portland cement contains about 63 per cent. of lime. By the action of water it is converted into a crystalline mass of hydrated calcium silicate and calcium hydrate. In hardening it rapidly absorbs carbonic acid and becomes coated on the surface with a film of carbonate, cement-mortar thus acting as an efficient protector of iron, and captures and imprisons every carbonic-acid molecule that threatens to attack the metal. The action is, therefore, not due to the exclusion of air; and even though the concrete be porous, and not in contact with the metal at all points, it will still filter out and neutralize the acid and prevent its corrosive effect."

Plaster-of-Paris when set does not thus neutralize any carbonic acid that is contained in the moisture absorbed from the air, and, instead of allowing the moisture to dry away from the metal, keeps it continually in contact, and thus increases the rate of rusting beyond what would be the case with iron without any covering. It thus assists corrosion.—ED. B. J.]

OUR PLATE.

"CROSSLANES" is a house at Frensham, near Farnham. It is built with white rough-cast walls and a local tile roof. The stone in the garden walls came from the inside of the old bridge at Frensham, having been replaced with concrete. The contractors were Messrs. J. H. & E. Dyer, of Alton, Hants, and the architects Messrs. Niven, Wigglesworth & Falkner, of London and Farnham.

LONDON COUNTY COUNCIL.

New Building Recommendations.

AT yesterday's meeting of the London County Council the Building Act Committee reported the following applications under the London Building Act, 1894, their recommendations as to consent or refusal being appended in *italics*:—

Buildings on the south side of Lancaster Road, Norwood, between Chatsworth Road and Dalmore Road, on the further application of C. J. Bentley, on behalf of L. S. Rogers. (*Consent.*)

Retention of an illuminated sign at No. 292, Euston Road, St. Pancras, on the application of A. Monighetti. (*Consent.*)

Retention of two projecting shops at Nos. 17 and 19, Loampit Vale, Lewisham, on the application of Blake & Dannatt. (*Consent.*)

Flight of steps in front of the Southfields Baptist Chapel, Wimbledon Park Road, Wandsworth, on the application of R. H. Weymouth. (*Consent.*)

Bay windows in front of Nos. 20, 26, 28 and 30, Beech-hill Road, Eltham, on the application of J. J. Bassett, on behalf of A. Cameron Corbett. (*Consent.*)

Bay windows in front of Nos. 1 and 7, Glenshiel Road, Eltham, on the application of J. J. Bassett, on behalf of A. Cameron Corbett. (*Consent.*)

Porch to a house to be known as "Dulce Domum," on the western side of Cleanthus Road, Shooter's Hill, Plumstead, on the application of A. A. Beard. (*Consent.*)

Retention of an iron forecourt railing in front of No. 22, Aubrey Walk, Kensington, at less than the prescribed distance from the centre of the roadway of the street, on the application of Selby and Kisingbury, on behalf of A. Withers. (*Refusal.*)

Library building, with projecting porches, on the east side of Holloway Road and south side of Fieldway Crescent, Islington, on the further application of H. T. Hare, on behalf of the Islington Metropolitan Borough Council. (*Consent.*)

Building at the corner of Old Nichol Street and Chance Street, Bethnal Green, on the application of C. R. Peters. (*Consent.*)

Ten one-storey shops at the junction of Horstead Road, Arica Road and Revelon Road, Brockley, on the application of A. H. Kersey, on behalf of the trustees of the late Robert Kersey. (*Refusal.*)

Porch to a proposed new church on the east side of Altenburg Gardens, Clapham Common, on the application of Kelley & Dickie, on behalf of the Rev. G. Grady. (*Refusal.*)

Erection, on the east side of Binstead Street, of an iron and glass shelter to the premises of Waring, Ltd., Oxford Street, St. Marylebone, on the application of R. F. Atkinson, on behalf of Waring, Ltd. (*Refusal.*)

Building on the north side of Grace's Mews, Camberwell Grove, Camberwell, with the forecourt boundary fence at less than the prescribed distance from the centre of the roadway of the street, on the application of A. W. Osborn, on behalf of J. F. Chiverall. (*Consent.*)

Two-storey building at the rear of No. 8, Rochester Square, Kentish Town, to abut upon Rochester Place at less than the prescribed distance from the centre of the roadway of that street, on the application of T. B. Westacott, on behalf of W. Baskwill. (*Consent.*)

Wood and glass roof over a portion of the yard at the rear of No. 52, Mile End Road, Stepney, at less than the prescribed distance from the centre of the roadway of Cecil Street, on the application of W. E. H. Crawley, on behalf of Franks and Simons. (*Consent.*)

Houses on a site on the east side of Elmington Road, Camberwell, with the forecourt fences at less than the prescribed distance from the centre of the roadway of that street, on the application of W. M. Proudfoot, on behalf of S. F. Cope. (*Refusal.*)

Three temporary wood and iron sheds at the borough Council's Callis Yard Depot, Woolwich, at less than the prescribed distance from the centre of Callis Yard, on the application of J. Rush Dixon, on behalf of the Woolwich Metropolitan Borough Council. (*Consent.*)

Iron gangway to connect Hay's Wharf and Willson's Wharf over the public right of way leading from Battle Bridge Lane to Battle Bridge Stairs, Rotherhithe, on the application of the proprietors of Hay's Wharf. (*Consent.*)

Wood and iron chute of a temporary character to connect Hay's Wharf with Willson's Wharf over the public way of Battle Bridge Lane, Rotherhithe, on the application of the proprietors of Hay's Wharf. (*Consent.*)

Modification of the provisions of that section with regard to open spaces about buildings, so far as relates to the proposed erection of a building to be known as No. 8, Frogna Terrace, West End Lane, Hampstead, with an irregular open space at the rear, on the application of R. L. Pearce, on behalf of the Middlesex Building Co., Ltd. (*Consent.*)

Modification of the provisions of that section with regard to open spaces about buildings so far as relates to the proposed erection of buildings on a site at the junction of Horstead, Arica and Revelon Roads with irregular open spaces at the rear, on the application of A. H. Kersey, on behalf of the trustees of the late R. Kersey. (*Refusal.*)

Building on the site of Nos. 132-135, Long Acre, to exceed in extent 250,000 cub. ft., and to be used for the purposes of a motor carriage works, repair shops and showrooms, on the application of W. Woodward, on behalf of Slater & Son and W. H. Eastgate. (*Refusal.*)

Extension of the period within which the erection of an addition to the Grosvenor Hotel, Victoria Station, Buckingham Palace Road, Westminster, was required to be completed, on the application of C. L. Morgan, on behalf of the London, Brighton, and South Coast Railway Co. (*Consent.*)

(Last week's decisions will be found on page xlii of this issue.)

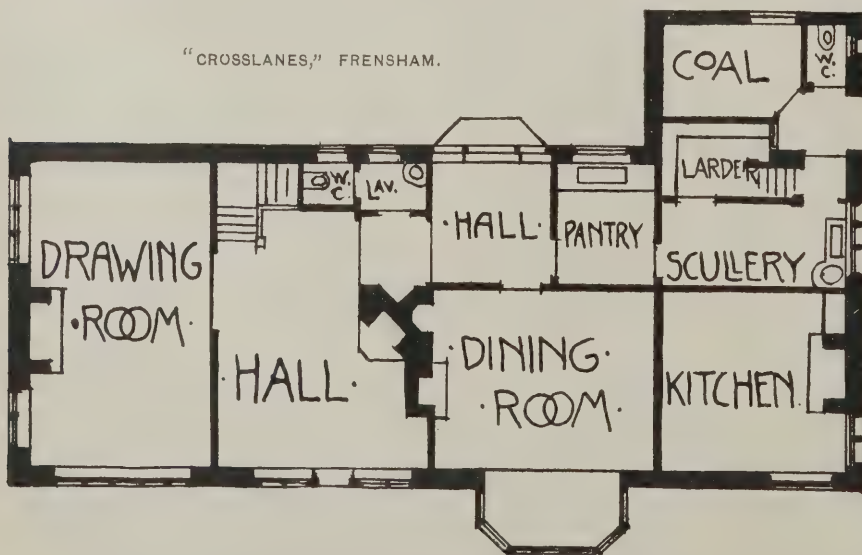

Notes and News.

Mr. T. G. Jackson, R.A., will, we believe, hang the architectural works at this year's Academy.

A Memorial to the late Mr. Alfred Waterhouse, R.A., is being arranged for in the parish church of Yattendon, Berkshire.

Messrs. Yarrow's Works at Scotstoun are to be carried out by Sir William Arrol & Co., who have sub-let the making of the dock basin and the building of the walls of the various shops to Messrs. Morrison & Mason, of Glasgow. The engine shop is to be 210ft. long and more than 150ft. wide, and the boiler shop 300ft. long and of the same width as the engine department, but the chief feature is the roof-covering of the dock, which is to be 320ft. long and 85ft. wide. The roof will be 140ft. wide, so that work may progress in the worst of weather.

"CROSSLANES," FRENTHAM.

[NIVEN, WIGGLESWORTH AND FALKNER. ARCHITECTS.]

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

Supplement to
THE BUILDERS' JOURNAL AND ARCHITECTURAL RECORD,
Wednesday, March 21st, 1906.

"CROSSLANES" FRENSHA

PLAN FOR MR H.J. BAKER.

NIVEN WIGGLESWORTH & FALKNER ARCHTS

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

Aberdeen Society of Architects.—Mr. R. G. Wilson has been elected president of this Society for the current year and Mr. John Rust vice-president.

An Artesian Well has just been bored at Celtic House, Leadenhall Street, E.C., to a depth of 450 ft., from which an electric pump raises the water at the rate of 2,500 gallons an hour.

A new Lunatic Asylum for Renfrewshire is being built at Dykebar, half-way between Hurlet and Paisley. Accommodation is to be provided for 250 patients. The estimate for the brick and mason work exceeds £23,000.

A Scottish Garden City.—Plans have been prepared for a "garden city" on the outskirts of Dundee. Messrs. Charles Ower & Co. have drawn up the scheme. Sixty-one semi-detached cottages will be proceeded with first, but a larger class of villas is also to be designed.

A new County Bridge across the Mersey, to connect Lancashire and Cheshire between Flixton and Carrington, is being erected by Mr. Matthew Hawley, of Hull, at a cost of about £3,600, under the direction of Mr. W. Compton Hall, the Lancashire county bridge-master. The structure will be of Darley Dale stone.

The Work of Restoring Shoreditch Town Hall after the fire of 1904 is now practically complete. It was begun about May last year. The contract has been satisfactorily carried out by Messrs. Killby & Gayford, of Worship Street, under the direction of Mr. Alfred W. S. Cross, F.R.I.B.A. The most conspicuous thing about the new hall is the superabundance of marble and gold.

Proposal to clean the Plaster off the Guildhall.—At last week's meeting of the Court of Common Council it was decided that it be referred to the City Lands Committee to consider and report on the desirability of removing from the walls and columns of the interior of the Guildhall the plaster or stucco with which they have been incrustated and disfigured. The porch has already been thus restored.

Treatment and Weathering of Cement Slabs.—Mr. Hippolyte J. Blanc, R.S.A., of Edinburgh, has been criticizing the use of cement slabs for the roof of the old Corstorphine Church. He does not think the work is successful, and considers that to put cement in imitation of stone is not the legitimate use of cement. Mr. P. Macgregor Chalmers, architect, of Glasgow, is of opinion that the concrete roof, while carried out most successfully, will not weather as they might desire.

Extension of Glasgow Municipal Buildings.—At their last meeting the Municipal Buildings Committee of the Glasgow Town Council had under consideration the plans by the city engineer for the proposed reconstruction of the property in Cochrane Street, to the west of the Sanitary Chambers, at an estimated cost of £99,000. The cost of the section at present proposed to be proceeded with is estimated at £68,000. The city engineer was instructed to get out the detail drawings for this first section.

Billinge Parish Church is proposed to be restored under the direction of Mr. T. G. Jackson, R.A. The north and south galleries are proposed to be removed and the church extended eastwards 40 ft., the extension taking the form of an octagon surmounted by a dome and flanked by short transepts, the present small apse being considerably lengthened and replaced at the east end of the octagon. The present church was built to replace an earlier one in 1717-8, and the galleries were not added until a century later—in 1823-4. The total cost of the contemplated work is £3,000.

Christ Church, Felling, has been restored and enlarged at a cost of £2,916.

A new Administrative Block at the Hackney Workhouse at Homerton is being built under two contracts representing a total of £37,176. The architect is Mr. W. A. Finch.

Putney Hippodrome.—On March 31st Sir Henry Kimber will lay the foundation-stone of the new Putney Hippodrome in Felsham Road. Messrs. Kingerlee & Son, of Oxford, are the contractors. The building will cost £23,000.

New Baths and Washhouses at Newcastle are being built at the corner of Gibson Street at a total estimated cost (including site) of £28,841. The builders are Messrs. J. & G. Douglas, of Heaton; the engineers Messrs. W. C. Dix & Co., of Low Bridge; and the architect Mr. F. H. Holford, the city property surveyor.

The Old Welcome Club at Earl's Court Exhibition, which was partly destroyed by fire last summer, is being entirely rebuilt in permanent form. The new premises will be of brick, rough-cast. An octagonal-shaped reception hall with a domed roof forms the feature of the main entrance. The dining-room, nearly roofed long, will be panelled like the hall in fumed oak.

A new Science School at Dulwich College is being erected at an estimated cost of about £18,000 from designs by Mr. Charles E. Barry, A.R.I.B.A. It is to the north of the present buildings, in red brick and terracotta. On the ground floor there will be provision for the teaching of physics, with a museum, and on the top floor chemistry rooms, with an optical laboratory. Lecture theatres and teaching laboratories will be provided.

A Valuable Manchester "Island."—The proposed demolition of the old church of St. Peter's Church, Peter Street, Manchester, was the subject of discussion at last week's meeting of the Manchester Improvements Committee. St. Peter's is situated on an "island" area—completely surrounded by tram lines. The site has a frontage to four important thoroughfares, and is consequently a very valuable one for commercial purposes. The Corporation, however, are taking powers to prevent its future use as a commercial site, as they consider the place should be left open after the demolition of the edifice.

Messrs. Carter & Co., of the Encaustic Tile Works, Poole, have recently opened the "White Works," Hamworthy, Poole, in order to meet the increasing demand for white-glazed wall tiles. The premises are of considerable extent, and are fitted throughout with the latest and most improved machinery. The Encaustic Tile Works at Poole will in future be devoted more particularly to the manufacture of constructional faience, terracotta, decorative tiles and mosaics, whilst the architectural pottery at Hamworthy will continue to produce every description of floor tiles.

Westminster Bridge.—The Earl of Liverpool, in reply to a question by the Duke of Rutland in the House of Commons recently, gave some interesting facts about the construction of Westminster Bridge. The original stone bridge at Westminster, he said, which ranked next in point of date after London Bridge, was built between 1738 and 1750 from the designs of Labelle. It had fifteen arches, resting on caissons, and alcoves in the parapet with seats for the shelter and rest of passengers. These alcoves could now be seen in Victoria Park. The cost was £218,800, with £170,690 more for the approaches, including Great George Street. In 1846 the piers of the bridge began to give way, and it soon had to be closed for traffic. Then was built the present bridge, with its approaches, at a cost of £553,000.

A Pavilion is to be built on the pier at Weymouth at an estimated cost of £12,500.

Cleaning Stonework with Steam.—The first instance in Edinburgh of the use of steam for cleaning stonework has been in Princes Street, where a large drapery establishment—formerly the Edinburgh Hotel—has been cleaned.

A Roman Villa has been found in Little Lippin Wood, near West Meon Church, Petersfield, Hants. The chief features that have been determined at present are a block of six rooms, with what is thought to have been a gateway on the east side, a double hypocaust in the south-west corner, and a buttress backing the wall to the block of rooms.

The Army Nurses' Home.—Steady progress is being made with the building of the Home for Nurses at the Military Hospital at Millbank, and, in view of the criticisms made some months ago as to the planning of the buildings, it is satisfactory to learn that important alterations have been made in the original plans, conforming with the Nursing Board's recommendations.

White Paint on White House.—A contemporary points out that white paint was formerly an important item in the cost of the upkeep of the White House at Washington. The mansion received a fresh coat two or three times a year, and eventually it came about that there was an extremely thick layer of paint all over it. To the pillars of the portico in front a perceptible accretion of diameter was contributed in the course of eighty years or so. But when, soon after the incoming of the Roosevelt administration, the establishment underwent a thorough renovation and reconstruction, all of this accumulated paint was burnt off by means of a flame-blast, exposing to view the original brown sandstone. Then a fresh coat of white was put on, and the edifice, which might originally have been called the Brown House, became once more, in appearance as well as in name, the White House. Since that time a new policy has been adopted in the treatment of the mansion. It is painted only at long intervals, and instead of a fresh coat of white it gets periodically a thorough washing with soap and water.

Town Houses, Old and New, were dealt with by Mr. W. H. White, F.R.I.B.A., before the last meeting of the Auctioneers' Institute. After referring briefly to the character and development of some of the principal streets and squares of the Metropolis during the seventeenth and eighteenth centuries, Mr. White contrasted the town house of the eighteenth century with that of the present day. The attention of the architect was formerly concentrated upon the reception-rooms and halls, the basement and upper floors being left to take care of themselves. Little care was bestowed on the bedrooms, children's or servants' rooms, which for the most part were low, badly arranged, ill-lighted and unventilated. As a rule the modern architect had successfully dealt with the legacy of defects left by his predecessors when called on to modernize such houses. A little study of the plans of the older town houses filled them with surprise as to how people lived in them. Probably more servants were required in an ordinary town house in the seventeenth and eighteenth centuries than now, and where did they sleep? The conditions were very different now, and were largely responsible for the altered character of the elevations; old ideas as to proportion had been abandoned, and the arrangement of windows to meet the demand for bays and balconies had changed the aspect of the street front. There was, however, a fussiness in modern designs compared with the quiet unobtrusive effect of the older type of front.

Complete List of Contracts Open.

WITH a few exceptions, news of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our last issue of other contracts that still remain open.

Unless expressly stated to the contrary all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair-wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Mar. 22. Linthwaite.—*Boundary walls* at the new burialground at Christ Church, Linthwaite, near Huddersfield. Plans and specifications may be seen and bills of quantities obtained at the Architects' Office. Sealed and endorsed tenders are to be sent to John Kirk & Sons, architects, Huddersfield and Dewsbury, by 3 p.m. on Mar. 22.

Mar. 22. Gravesend.—*Enlargement* of the "Gravesend and Dartford Reporter" printing premises, Harmer Street. Drawings, specifications and conditions of contract may be seen, and forms of tender obtained, at the Architect's Office, 22, Durham Road, Blackhill, co. Durham. Tenders to be sent in, endorsed "Tender for Cottages, Langley Park," to W. R. Pigg, setty., Co-operative Stores, Anfield Plain, R.S.O., on or before 4 p.m. on Mar. 26.

Mar. 27. Houghton.—*Re-roofing and repairing* an existing warehouse and the construction of a new shed, for the Lancashire and Yorkshire Railway Co. Plans can be seen and form of tender and specification obtained on application at the Engineer's Office, Hunt's Bank, Manchester. Tenders, endorsed "Tender for Re-roofing and Repairing Warehouse at Houghton," to be in the hand of R. C. Irwin, setty., Hunt's Bank, Manchester, by 10 a.m. on Mar. 27.

Mar. 27. London, N.W.—*1,412 ft. lineal, or thereabouts, of brick wall* 8ft. 6ins. in height, to the Isolation Hospital grounds at Dog Lane, Neasden, for the Willesden D. Council. Plans and specifications may be seen and all further particulars obtained upon application to O. Claude Robson, M.I.C.E., engineer to the Council, Public Offices, Dyne Road, Kilburn, N.W. The tenders, upon printed forms (to be obtained from the Engineer), and endorsed "Boundary Wall," to be delivered at the offices of the Council not later than 4 p.m. on Mar. 27.

Mar. 27. Yarm.—*New vestry.* Contractors desirous of submitting tenders for the above may see the plans and specification at the church, and at the office of the architects. Bills of quantities may be obtained on application to Wright & Son, surveyors, Lancaster. Tenders to be delivered (under cover) to the architects, Austin & Paley, architects, Lancaster, not later than noon on Mar. 27.

Mar. 27. Litherland and Bootle.—*Station buildings, platforms, &c.*, for "Haltes," at Linacre Road, Litherland, and Captain's Lane, Bootle, on the Aintree and Bootle Branch Railway of the Lancashire and Yorkshire Railway. Plans can be seen and form of tender and specification obtained on application at the Engineer's Office, Hunt's Bank, Manchester. Tenders, endorsed "Tender for Station Buildings, &c., at Linacre Road and Captain's Lane," to be in the hands of R. C. Irwin, setty., Hunt's Bank, Manchester, by 10 a.m. on Mar. 27.

Mar. 28. Harrington.—*New tower,* Harrington Church, for the Vicar and Churchwardens. Plans may be seen, and quantities and specifications obtained, from John F. Curwen, F.S.A., F.R.I.B.A., architect and sanitary engineer, 26, Highgate, Kendal, to whom all tenders must be sent in before noon on Mar. 28.

Mar. 28. Kettering.—*Showyard*, for the Northampton Agricultural Society's show, to be held at Kettering on June 6 and 7. Tenders to be sent to the secretary, A. E. Lovell, Harpole, Northampton, by Mar. 28.

Mar. 29. Cefn-Coed.—*Thirty-nine houses.* Particulars can be obtained from R. Cound Jenkins, architect, Cefn-Coed. Tenders to be sent in by Mar. 29.

Mar. 29. Guildford.—*Portland cement* for the ensuing twelve months, for the Town Council. Specifications and forms of tender may be obtained at the office of the borough surveyor, C. G. Mason, A.M.I.C.E., Tuns Gate, Guildford. No tender will be considered which is not upon the prescribed form. Tenders, endorsed "Tender for Cement," to be sent to F. S. Miller, town clerk, Town Clerk's Office, Bridge Street, Guildford, by noon on Mar. 29.

Mar. 30. Shewsbury.—*Additions to workhouse* consisting of a dayroom, stone-breaking cells, bathroom, iron gangway and staircase, for the Guardians of the Atcham Union. Plans and specifications can be seen at the Union Offices, St. John's Hill, Shrewsbury, and any other information can be obtained from A. B. Deakin, Pride Hill, Shrewsbury, the architect to the Guardians. Tenders, under seal, endorsed "Tender for Buildings," to be sent to Joseph Everest, clerk to the Guardians, Atcham Union Offices, St. John's Hill, Shrewsbury, by Mar. 30.

Mar. 31. Forres.—*Additions and alterations* to the Mechanics' Hall Buildings. Plans and specifications of the works may be seen with the Architect, and offers to be lodged with John Forrest, architect and surveyor, Forres, by noon on Mar. 31.

April 2. Rotherham.—*New business premises* at the corner of Doncaster Gate and Wellgate. Builders wishing to tender must forward their names and addresses, accompanied with a deposit of £3 3s., to J. Platts, architect, &c., High Street, Rotherham, by April 2.

April 2. Banbridge.—Dispensary and dispensary residence for the use of the medical officer of the Crossgar Dispensary District, in the townland of Crossgar, convenient to the village of Dromare, according to the plans and specifications prepared by W. W. Larmor. The Guardians desire that the materials used in the above works shall be, as far as possible, of Irish manufacture. The contractor must undertake to have the whole of the works completed on or before Oct. 31. Sealed tenders, addressed "To the Presiding Chairman," on the special form, and containing the names and addresses of two solvent sureties willing to join with contractor in a joint and several bond for double the amount of the contract, will be received at the Poor Law Office, Workhouse, Banbridge, up to noon on April 2.

April 2. Gunnislake.—Wesleyan church and schoolroom at Chilsworth, near Gunnislake. Plans and specifications may be seen at Delaware Road, Gunnislake. Sealed tenders are to be sent to R. Leverton, secy., by April 2.

April 2. Itchen.—Additions to Boys' County School, for the Southampton County Council. Persons desirous of tendering may see drawings, specification and conditions of contract, and obtain bills of quantities and all necessary information, at the office of W. J. Taylor, county surveyor, The Castle, Winchester, between 9 and 5 (Saturdays 9 and 1). A deposit of £2 2s. will be required for a copy of the bills of quantities. Deposits must be made by cheque, payable to Hants County Council and crossed Bank of England, or particulars will not be sent. Tenders, endorsed "Proposed Additions, Itchen (Sholing) Boys' Council School," are to be delivered to H. Barber, clerk of the County Council, The Castle, Winchester, by 10 a.m. on April 2.

April 2. Thornley.—Small-box hospital, near Thornley, county Durham, for the Easington and Sedgfield Joint Smallpox Hospital Board. Plans may be inspected and specification and form of tender obtained at the office of the Architect and Surveyor, James Stones, Sedgfield, on a payment of £2. Tenders, endorsed "Hospital," must be delivered to J. M. Longden, clerk to the Board, Somerford Buildings, Sunderland, by noon on April 2.

April 3. Guildford.—Enlargement of post-office. Drawings, specification and a copy of the conditions and forms of contract may be seen on application to the Postmaster. Bills of quantities and forms of tender may be obtained at H.M. Office of Works, Storey's Gate, London, S.W., on payment of £1 rs. Tenders must be endorsed "Tender for Guildford Post Office," and addressed, Secretary, H.M. Office of Works, Storey's Gate, London, S.W., by noon on April 3.

April 4. Bradford.—Builders' work in all trades, and for constructional steelwork, required in the extension of the Town Hall (second section). Drawings and general conditions of contract may be seen and bills of quantities and form of tender obtained on application to F. E. P. Edwards, A.R.I.B.A., city architect, Whitaker Buildings, Brewery Street, Bradford. Sealed and endorsed tenders must be sent to Frederick Stevens, town clerk, Town Hall, Bradford, not later than noon on April 4.

April 4. Tatworth.—New infant school at Tatworth, Chard, for the Somerset County Education Committee. Drawings, specification and condition of contract may be seen at the Chard Tatworth Council School, and bills of quantities and forms of tenders obtained from Samson & Cottam, 43, High Street, Bridgwater, on deposit of £1 rs. Sealed tenders, endorsed "Tatworth Infants' School," must be delivered at the County Education Office, Weston-super-Mare, not later than noon on April 4.

April 4. Dublin.—Retaining walls, vaults, foundations and walls, &c., up to the ground-floor level, for the proposed new building about to be erected in Upper Merrion Street, Dublin, for the Commissioners of Public Works. Bills of quantities and form of tender prepared for the purpose can be obtained on application to the Secretary, Office of Public Works, Upper Merrion Street, Dublin, on the payment of £1 rs. The drawings and specification, &c., may be seen at the Offices of the Commissioners between 10 and 5. Tenders to be delivered, addressed to the Secretary, Office of Public Works, Dublin, before noon on April 4.

April 7. Stockport.—First portion of an observation block, at Dialstone Lane Hospital. The general conditions, specifications, &c., will be supplied by the architect, G. H. Brady, Borough Chambers, St. Petersgate, after Mar. 24, on payment before that date of a deposit of £1 rs. Fair wages clause. Sealed tenders, endorsed "Hospital Building Contract," addressed to the Chairman of the Health Committee, must be delivered to Robert Hyde, town clerk, Town Clerk's Office, Stockport, by noon on April 7.

April 9. Cheshunt.—Public library at Turners' Hill, in accordance with the plans and specification prepared by J. Myrle Smith, 8, Trafalgar Square, Chelsea, S.W. Persons desirous of tendering are requested to forward their names and addresses to the Clerk of the Council, Manor House, Waltham Cross, together with a deposit of £5. Forms of tender and bills of quantities will be forwarded, the persons having made such deposit. Plans and specification can be seen at the office of the Architect as above, and also at the offices of the Council, between 10 and 5, Saturdays 10 to 1. Sealed tenders, endorsed "Tender for Public Library," to be addressed to the Chairman, General Purposes Committee, Cheshunt Urban D. Council, Manor House, Waltham Cross, and delivered not later than 4 p.m., on April 9.

April 9. Itchen Woolston.—Additions to St. Mark's Girls' and Infants' Council School, for the County Council. Persons desirous of tendering may see drawings, specification and conditions of contract, and obtain bills of quantities and all necessary information, at the office of W. J. Taylor, county surveyor, The Castle, Winchester, between 9 and 5 (Saturdays 9 and 1). A deposit of £2 2s. will be required for a copy of the bills of quantities. Deposits must be made by cheque, payable to Hants County Council and crossed Bank of England, or particulars will not be sent. Tenders, endorsed "Proposed Additions, Itchen Woolston, St. Mark's Girls' and Infants' Council School," are to be delivered to H. Barber, clerk

of the County Council, The Castle, Winchester, by 10 a.m. on April 9.

No date. South Norwood.—Congregational Church. Apply, George Baines & Son, architects, 5, Clement's Inn, Strand, with references and list of churches erected.

ENGINEERING.

Mar. 23. Leigh.—Water meter house at Pennington Green, Aspull. Specification and form of tender may be had from the Borough Engineer and drawings may be seen at the offices of the Water Department. Sealed tenders to be delivered to Stanley Wilson, town clerk, Town Hall, Leigh, Lancashire, on or before noon on Mar. 23. Envelopes to be endorsed "Tender for Water Meter House."

Mar. 23. Halifax.—Steel and cast-iron work in connection with the construction of a drying-house floor, including a steel calorifier for water heating, at the Workhouse. Apply, W. C. Williams, architect, 29, Southgate, Halifax. Tenders to be sent in by Mar. 23.

Mar. 24. Peterhead.—Cutting and filling tracks, supplying and laying about 1,320 lin. yds. of 10-in. diameter cast-iron pipes, with the necessary valves and fittings, in the duplication of the main supply pipe through the West Den. Plans and specifications may be seen with and schedules of quantities obtained from James Dickie, burgh surveyor, Peterhead, and sealed and docketed tenders to be lodged with David Martin, town clerk, Peterhead, not later than 10 a.m. on Mar. 24.

Mar. 27. Southampton.—Laying a storm-water sewer on the Western Shore. Plans and specification may be inspected and bills of quantities and forms of tender obtained at the Borough Engineer's Office, upon production of the borough treasurer's receipt for a deposit of £1 rs. Tenders on the supplied forms, endorsed "Tender, Storm Water Sewer," must be delivered at the Town Clerk's Office before noon on Mar. 27.

Mar. 27. Crumspall.—Widening of bridge carrying Crumspall Lane over the railway, for the Lancashire and Yorkshire Railway. Plans can be seen and form of tender and specification obtained on application at the Engineer's Office, Hunt's Bank, Manchester. Tenders, endorsed "Tender for Widening Crumspall Lane Bridge," to be in the hands of R. C. Irwin, secy., Hunt's Bank, Manchester, by 10 a.m. on Mar. 27.

Mar. 29. Workington.—Supply and erection of steel-plate girders and curved steel flooring plates, required for the widening of the bridge over the Cleator and Workington Junction Railway; also for the building of the necessary masonry, abutments, wing walls, &c., and for other works, for the Corporation. Drawings and specification may be seen and bills of quantities and form of tender obtained at the office of W. L. Eaglesfield, borough engineer and surveyor, on deposit of £1 rs. Sealed tenders, endorsed "Tender for Girders, Abutments, &c.," are to be delivered to John Warwick, town clerk, Town Hall, Workington, by Mar. 29.

Mar. 30. Bournemouth.—Cliff lift, waiting-rooms, track, &c., for the Corporation. Full particulars can be obtained on deposit of £2 2s. from the Borough Engineer, Municipal Offices, Bournemouth. Tenders to be sent in by Mar. 30.

Mar. 30. Truro.—Two filter beds and accessory works adjoining the waterworks, in the parish of St. Clement. Also for the construction of a covered service reservoir to contain about 500,000 gallons alongside the existing service reservoir in the above parish. Drawings may be seen and copies of the specification and bills of quantities obtained at the office of the engineers, James Mansergh & Sons, 5, Victoria Street, Westminster, on deposit of £2. Early application for particulars is desirable, as only a limited number will be given out. Sealed tenders for one or both contracts, endorsed accordingly, are to be delivered (post paid) at the office of Arthur E. Adams, secy., 31, Lemon Street, Truro, by noon on Mar. 30.

Mar. 31. Chappanslade.—Small service reservoir and the providing and laying of 971 lin. yds. of 3-in. and 4,078 lin. yds. of 2-in. cast-iron mains, with valves, fittings, &c., for works of water-supply. General conditions, bills of quantities and forms of tender may be obtained from and the specifications and drawings inspected on application to W. H. Stanley, A.M.I.C.E., Market House Chambers, Trowbridge. A deposit of £2 2s. is required for a copy of the bills of quantities. Sealed tenders, endorsed "Tender for Chappanslade Water-supply Works," to be delivered to John Callaway, clerk to the Westbury and Whorwells-down Rural D. Councils, Westbury, Wilts, by Mar. 31.

Mar. 31. Greenock.—Heating of the town hall and its vestibules, corridors, &c. Schedules and further information may be obtained on application to Alex. J. Turnbull, C.E., master of works. Sealed offers, endorsed outside "Town Hall Heating," to be lodged with the Town Clerk, Municipal Buildings, Greenock, by Mar. 31.

April 2. Glasgow.—Renewal of bridges on Cleland and Mid-Caldor Line, underbridges at 3 miles 6½ chains, 11 miles 74 chains, and 12 miles 23 chains, and Wishaw and Coltness Line at 86 miles 35 chains (subway, Wishaw South Station), for the Caledonian Railway Co. Drawings may be seen at the office of the Company's District Engineer, 3, Gormiston Street, Glasgow, where copies of the specification and schedule may be obtained on payment of £2 2s. Sealed tenders, endorsed "Tender for Steel Work required in the Renewal of the Superstructure of Four Bridges on the Western District," to be lodged with J. Blackburn, secy., Caledonian Railway Co.'s Offices, 302, Buchanan Street, Glasgow, by April 2.

April 3. Reigate.—Heating of the Workhouse, situate at Earlswood, Redhill. Further information can be obtained from the architect, E. Penfold, A.R.I.B.A., High Street, Reigate, who will supply copies of plans and other particulars. Applications should be made as early as possible, as the schemes must be submitted by April 3.

April 5. Risca.—Two bridges, for the Urban D. Council. Fair wages clause. Particulars from the Surveyor, Council Office, Risca. Tenders to be sent in by April 5.

April 6. Brixham.—Water-supply. Supply, delivery and laying of about 4½ miles of 7-in. and 5-in. cast-iron water-mains, together with the requisite sluice valves, air-valves, meter, wash-outs, and other fittings, the construction of a service reservoir, boundary walls, meter-house and store, and other works in connection with the above undertaking. Drawings may be seen and copies of specification, bills of quantities and forms of tender obtained at the office of the engineer, F. W. Vanstone, C.E., Palace Chambers, Paignton, on payment of £5. Sealed tenders, upon the form provided, endorsed "Brixham Waterworks," are to be addressed to Joseph L. Arlidge, clerk to the Council, Town Hall, Brixham, by April 6.

April 9. Norwich.—Heating and hot-water supply work at the extensions of the City Asylum, Helleston. Plans and specification may be seen and forms of tender obtained on application at the City Engineer's Office. Tenders, on the forms supplied, enclosed in envelopes sealed with sealing wax, endorsed "Asylum Heating," and addressed to the Chairman of the Asylum Committee, must be delivered at the office of Arthur E. Collins, M.I.C.E., city engineer, &c., Guildhall, Norwich, by noon on April 9.

IRON AND STEEL.

Mar. 26. Edinburgh.—667 tons of cast-iron pipes from 2 ins. to 15 ins. in diameter, for the Edinburgh and District Water Trust. The drawings may be seen and copies of specifications and forms of tender may be obtained at the Superintendent of Works' Office, No. 12, St. Giles Street, Edinburgh. Tenders, endorsed "Tender for Cast-iron Pipes," must be lodged with William Boyd, W.S., clerk to the Trust, Water Trust Chambers, 12, St. Giles Street, Edinburgh, by Mar. 26.

PAINTING AND PLUMBING.

Mar. 22. Tavistock.—Water-supply to the showyard for the Devon County Agricultural Association. Plans and specification can be seen by application to A. Kenneth G. Johnstone, local secy., 1, Church Lane, Tavistock, to whom tenders are to be delivered by Mar. 22.

Mar. 24. Barrow-in-Furness.—Painting, papering, &c., at the Cemetery Entrance Lodge, in Devonshire Road. Bills of quantities may be obtained at the Borough Engineer's Office, Town Hall. Tenders to be delivered not later than noon on Mar. 24.

Mar. 26. Gwauncaegurwen.—Painting the interior of the public hall, &c. Specifications may be seen with J. Mark, Post Office, Gwauncaegurwen. Sealed tenders, marked "Tenders for Painting," must be delivered to William D. Evans, Glynteg, Gwauncaegurwen, by Mar. 26.

Mar. 27. Sutton Ford.—Painting, &c., at the Isolation Hospital, for the Rochford Rural D. Council, according to a specification which may be seen at the Clerk's Office. Tenders (marked "Hospital Painting") should be sent to Frederick Gregson, clerk, 46, Alexandra Street, Southend, by 10 a.m. on Mar. 27.

Mar. 30. Salford.—Painting two bridges over the River Irwell. The specification and forms of tender and all other information may be obtained from the Borough Engineer's Office, Town Hall, Salford. Tenders, endorsed "Painting Bridges," addressed to the Chairman of the Building Committee, must be delivered to L. C. Evans, town clerk, Town Hall, Salford, by 10 a.m. on Mar. 30.

Mar. 31. Barking.—Painting of bridge and poles on the Barking and Beconton Light Railway. Specification and form of tender can be obtained on application to H. L. Howard, Electricity Works, East Street, Barking. Fair wages clause. Tenders are to be sent in, endorsed "Tenders for Painting Bridge, &c.," addressed to the Chairman of the Electricity and Tramways Committee, Public Offices, Barking, before noon on Mar. 31.

Mar. 31. Derby.—Painting the outside portions of the Workhouse premises and cleaning and decorating the interior of the Workhouse chapel. Specification and forms of tender can be obtained at the Poor Law Offices, and tenders, on the form and in the envelope supplied, must reach N. Twigg, clerk to the Guardians, Poor Law Offices, Derby, by Mar. 31.

ROADS AND CARTAGE.

Mar. 22. London, N.—Making-up of the under-named private streets, for the Finchley Urban D. Council:—Etchingham Park Road, Seymour Road, Claverley Grove, Windsor Road, Elmfield Road and New Trinity Road, together having a length of about 1,750 yds. The works are to be constructed in accordance with plans and drawings which may be inspected at the offices of the Engineer and Surveyor to the Council, at Church End, Finchley. Copies of the specification and schedules, together with forms of tender, may be obtained from the Engineer on application, accompanied with a deposit of £3. Sealed tenders, endorsed "Private Street Works," to be sent to E. H. Lister, clerk to the Council, Council Offices, Finchley, London, N., by 5 p.m. on Mar. 22.

Mar. 22. Little Woolton.—2-in. machine broken granite macadam and granite chippings at any time up to Mar. 31, 1907. Further particulars and forms of tender may be obtained from the Surveyor, R. Simmons, Grange Lane, Gateacre, near Liverpool. Tenders, endorsed "Tenders for Macadam," and addressed to the Chairman of Works Committee, Little Woolton Urban D. Council, Surveyor's Office, Grange Lane, Gateacre, near Liverpool, to be sent in before 4 p.m. on Mar. 22.

Mar. 22. Rhondda.—Road macadam, viz.:—3,500 tons of granite or basalt road macadam broken to a 2-in. gauge, 400 tons broken to a 1½-in. gauge and 800 tons of ½-in. chippings; 6,800 tons of limestone macadam broken to a 2-in. gauge and 2,000 tons of ½-in. chippings. Specification and forms of tender may be obtained on application to the Surveyor, Public Offices, Pentre, Rhondda. Sealed tenders must be delivered, addressed to the "Chairman of the Roads Committee," at the Public Offices, Pentre, Rhondda, and endorsed "Tender for Granite or Limestone Macadam" respectively, by Mar. 22.

(Continued on p. xiv.)

IN PARLIAMENT.

(By our Press Gallery Representative.)

A War Office Contract.

SOME interesting correspondence appears in the appropriation account of the sums granted by Parliament for the expense of the Ordnance factories relating to a payment of £900 to a firm of contractors as compensation in respect of probable profit on work held back from them. According to the War Office statement of the case, on May 2nd, 1900, the tender of Messrs. Kirk & Randall was accepted for the reconstruction of danger buildings at Woolwich, the work to be paid for by measurement. The contract included the provision for "all labour, materials and transport which might be required for and in the construction of the works shown in the specification and drawings." As the work was very urgent, the drawings were not prepared when the contract was entered into, but it was stipulated in the contract that drawings were to be furnished to the contractors. In a memorandum accompanying the tender, however, the general nature of the buildings required, with their dimensions, was stated, and the drawings were subsequently furnished. The total payment to Messrs. Kirk & Randall for work executed by them under this contract amounted to about £107,000. The firm, however, made a claim that certain work necessary for the completion of the buildings which they were ready to execute and capable of performing was done by the Building Works Department, or by other contractors, and estimated the profit they would have made on the work so withheld from them at £6,150. They contended that most of the work held back from them was of a profitable nature, and if done by them the profit thereon would have practically nullified their actual loss on the contract, which they placed at £6,696. After calculations and an interview between the Superintendent of Building Works and Mr. Randall, the latter agreed to accept £900 in settlement of his claims. It was pointed out that, were payment of this sum withheld, it was most probable that Messrs. Kirk & Randall would press for arbitration in the matter, and in view of the somewhat intricate and contentious nature of the case and the doubtful position of the War Department, it was considered that nothing would be gained by allowing the case to go to arbitration, but that on the contrary the Department would have to pay more to the contractor in addition to some portion (if not the whole) of the costs of the arbitration. The difficulty had arisen in consequence of the general practice of the Building Works Department at the Royal Arsenal executing certain work either directly or by special contractors. An express reservation justifying this position is made in the triennial contracts, and although this was not done in the case of Messrs. Kirk & Randall's contract, the practice was followed in this instance also. The firm were old contractors at the Arsenal, well acquainted with the practice, and there was no occasion to anticipate that the present claim would be raised. The Treasury solicitor had, however, advised that no custom would give a power to deviate from the clear terms of the contract specifications and drawings; consequently the claim could not be altogether resisted.

Such were the circumstances as stated for the consideration of the Treasury officials, who agreed to the payment of the £900. In another communication from the Army Council it was pointed out that it was doubtful whether the War Office had actually lost any money over the transaction, as experience had shown that if a clause were inserted holding back specified items in a contract for work to be paid for by measurement, the effect was to increase the amount

of the tenders by raising or reducing the percentage on or off the district schedule prices for each item. In this particular case the contract rate was 11½ per cent. on the schedule prices, while the next lowest offer was 15 per cent. on the schedule.

Phoenix Park Additions.

In reply to Mr. T. M. Healy, who asked when the Government proposed to throw open to the public the recent additions to the Phoenix Park, Mr. McKenna stated that the additional land referred to was acquired with a view not to increasing the area of the Phoenix Park but to preserving its existing amenities. It was separated from the Park by a public road, and a large part of it, in addition, by an unbridged river. He was not prepared to authorize its inclusion in the Park, as he was informed that the expense of such a measure would be prohibitive.

Ecclesiastical Commissioners' Buildings.

Mr. Stuart-Wortley informed Mr. Herbert Roberts that the total estimated cost of the buildings which the Ecclesiastical Commissioners are erecting at Westminster is about £150,000.

NEW LONDON BUILDINGS.

AT last week's meeting of the London County Council the Building Act Committee reported the following applications under the London Building Act, 1894, their recommendations as to consent or refusal being appended in *italics* :—

Buildings upon a site abutting upon a new street to lead out of Ebury Street and also upon Grosvenor Garden Mews North, Pimlico, on the application of A. F. Faulkner, on behalf of Willott. (*Consent.*)

Buildings abutting upon Red Lion Court, Fleet Street, City, with external walls at less than the prescribed distance from the centre of Red Lion Court, on the application of Griffin & Woollard, on behalf of A. Rust. (*Consent.*)

Buildings on the north-east side of Wharf Road, Bethnal Green, with external walls at less than the prescribed distance from the centre of the roadway of such street, on the application of M. W. King & Son. (*Consent.*)

Town hall building upon a site abutting on Brixton Hill and Acre Lane, Brixton, on the application of Warwick & Hall. (*Consent.*)

Wall on the western side of Gravel Lane, Southwark, on the application of Nevinston & Newton, on behalf of Stevenson & Howell, Ltd. (*Consent.*)

Projecting one-storey shops in front of Nos. 33 to 45 (odd numbers only) inclusive, High Street, Lewisham, on the application of Kennard Brothers, on behalf of Chieseman Brothers. (*Consent.*)

Projecting sign in front of No. 32A, St. James Street, on the application of R. H. Kerr, on behalf of Sandow, Ltd. (*Consent.*)

Re-erection of Nos. 8, 9 and 10, Paddington Green, Paddington, on the application of Bourdier, Burmester, & Galsworthy. (*Consent.*)

Extension of the period for the erection of a projecting lavatory addition and steps in front of "Seion" Welsh chapel, Southerton Road, Hammersmith, on the application of L. W. Williams. (*Consent.*)

Retention of an iron and glass shelter in front of the porch of the Coburg Hotel, Carlos Place, Grosvenor Square, on the application of E. H. Watts, on behalf of the Coburg Hotel, Ltd. (*Consent.*)

Bay window, five storeys in height, in front of No. 14, Fitzroy Square, St. Pancras, on the application of M. M. Smith. (*Consent.*)

Motor-car shed of a temporary character at the rear of No. 100, Allyn Road, Dulwich, to abut upon South Croxted Road, on the application of J. Harrison and Co., on behalf of Barnett. (*Consent.*)

Retention of a range of luncheon and store sheds at Lord's cricket ground, abutting upon St. John's Wood Road, Wellington Road, and Wellington Place, St. John's Wood, on the application of F. E. Lacey. (*Consent.*)

Building upon a site abutting on Blythe Road and Addison Gardens, West Kensington, on the application of Col. E. Clarke, on behalf of F. Smiths. (*Refusal.*)

Iron and glass porch in front of No. 6, Chesterfield Street, Mayfair, on the application of Hindley & Wilkinson, on behalf of R. G. Behrens. (*Refusal.*)

Retention of a wall in the rear portion of the one-storey shops in front of Nos. 190 to 208 (even numbers only) inclusive, Pentonville Road, on the application of C. E. Pettit, on behalf of T. Lilley and Lilley & Skinner, Ltd. (*Refusal.*)

Projecting lettering in front of No. 56, Charing Cross, on the application of the Liverpool, London and Globe Insurance Co. (*Refusal.*)

Trade and Craft.

A "Wind-up" Ceiling Rose.

The Edison & Swan United Electric Light Co., Ltd., have just put on the market a very ingenious "wind-up" ceiling rose. By the illustration below it will be seen to comprise a spring drum on which the length of wire coils as the light is raised to any desired height, but the special point to note about it is that whereas in other devices of a similar description which have been placed upon the market from time to time it has been necessary to have a fitting of a specified

weight sufficient to balance the strength of the spring drum, this particular "wind-up" ceiling rose of the Edison & Swan Co. works without any such balance weight, and can be used with fittings of varying weights with equal effect, as it is not upon the weight of the fitting that the working of the article depends but upon the band-break arrangement which can be clearly seen in the illustration. Unlike other types, the entire mechanism is enclosed in porcelain, and perfect electrical contact is made.

Post Free on Application

(Continued from p. xiii.)

Mar. 22. Peterborough.—*Broken granite, edging, &c.*, and Portland cement during the twelve months ending Mar. 31, 1907. Specifications and tender forms may be obtained at the City Surveyor's Office. Tenders, properly endorsed and written on the prescribed forms only, to be sent to the Town Clerk on or before Mar. 22.

Mar. 23. Higher Broughton.—*Asphalting, paving, &c.*, of the playgrounds at the Devonshire Street Council School. Plans may be inspected and specifications obtained at the office of the architects, C. K. & T. C. Mayor, 41, John Dalton Street, Manchester, between 10 and 5, on payment of a deposit of £1 is. Sealed tenders, endorsed "Tender for Asphalting," and addressed to the Chairman of the Elementary Education Sub-committee, must be delivered to L. C. Evans, town clerk, Town Hall, Salford, by noon on Mar. 26.

Mar. 23. Manchester.—*Severing, draining, paving, &c.*, North Street, from Lord Street to George Street, Openshaw, South Manchester; Manila Street, Beswick, North Manchester; Ray Street, Arcoats, North Manchester; passage behind 2 to 22, Grey Street, and adjoining 22, Grey Street, Newton Heath, North Manchester. Forms of tender may be obtained on application to the Paving, &c., Department (surveyor's office), and must be returned to the Chief Clerk, Paving, &c., Department, Town Hall, Manchester, before 10 a.m. on Mar. 23.

Mar. 23. Troutbeck.—*Widening* of a portion of Holbeck Lane, near Kilns Cottage, consisting of excavating, grubbing of trees, and the building of a fence wall and retaining wall. Plan and specification may be seen on application to George Browne, Town End, Troutbeck, who will show the work. Tenders to be sent so as to reach William Dawson, highway surveyor, Westfield, Kendal, not later than Mar. 23.

Mar. 24. Chertsey.—*Supply of the following materials for the Rural D. Council*:—Granite (coarse and fine); flints, gravel (coarse and fine) and shingle; chalk and kerbing. Forms of tender and the description of the various materials and the estimated quantities that may probably be required may be obtained of W. Durrant, surveyor, Spinney Hill, Addlestone. Sealed tenders, endorsed "Tenders for Road Materials," must reach the Clerk's Office, 20, Guildford Street, Chertsey, by noon on Mar. 26. Samples are required of the various materials tendered for, and must be sent to the Board Room, Union Workhouse, Ottershaw, Chertsey, so as to reach there by noon on Mar. 26.

Mar. 24. Driffield.—*Road materials*, for the Rural D. Council as follows:—About 6,000 tons of whinstone; about 1,000 tons of slag; about 900 tons of sea cobbles; about 300 tons of sea gravel; about 250 tons of tarred chips. Particulars and forms of tender can be obtained on application to T. Casson Beaumont, C.E., surveyor, Driffield, to whom tenders, endorsed "Tender for Materials," are to be sent not later than Mar. 24.

Mar. 24. Derby.—*Team labour*, for the County Council. Form of tender and conditions of contract may be obtained at the Surveyor's Office or from the under-mentioned district surveyors, and will be forwarded through the post on receipt of a stamped addressed foolscap envelope:—Alfreton district: B. Comb, Ashgate Road, Chesterfield. Ashbourne: J. F. Bamforth, Mayfield Road, Ashbourne. Bakewell: J. E. Blackwall, Bakewell. Belper: D. Robinson, Duffield, near Derby. Chapel: H. T. Hughes, Chapel-en-le-Frith, via Stockport. Derby: W. F. Perry, Repton, Burton-on-Trent. Eckington: R. Watson, Norton Woodseats, near Sheffield. Tenders are to be delivered to J. W. Hopton, county surveyor, County Offices, St. Mary's Gate, Derby, by Mar. 24.

Mar. 24. Ramsey.—*800 tons of broken granite* (300 tons X size, 400 tons XX size, and 100 tons XXX size), to be delivered to the stations at Ramsey (G.N. or G.N. & G.E. Joint) from April to Dec. next. Tenders, accompanied by samples, to be sent (carriage paid) to Richard F. Serjeant, clerk to the Council, Ramsey, Hunts, by Mar. 24.

Mar. 26. Romford.—*1,400 tons of blue Guernsey granite* broken to 1½ in. cube. Tenders, with samples and marked "Tender for Granite," to be sent, on forms to be obtained from the Surveyor, to Charles T. King, clerk, Council Offices, Romford, by Mar. 26.

Mar. 26. Hale.—*Making-up Leicester Road*, for the Urban D. Council. Plan and specification can be seen and bill of quantities and forms of tender can be obtained, on the payment of a deposit of £1 is., at the office of the Council's Surveyor, F. E. Boaz, any day during the office hours. Tenders are to be received by J. G. Whyatt, clerk to the Council, Council Offices, Ashley Road, Hale, Cheshire, by noon on Mar. 26.

Mar. 26. Perth.—*Causewaying of carriageway in Caledonian Road with new whinstone setts, and the causewaying of carriageway in St. Catherine's Road with old setts* supplied by Town Council. Plans can be seen, and specifications and schedules of quantities obtained at the office of Robert McKillop, burgh surveyor, 16, Tay Street, Perth. Tenders to be lodged in the hands of John Begg, town clerk, Perth, not later than noon on Mar. 26, sealed and endorsed "Tender for Causewaying Caledonian Road and St. Catherine's Road."

Mar. 26. Shifnal.—*Granite and slag*, for the Rural D. Council. Further particulars may be obtained on application to G. H. Stevenson, district surveyor, Shifnal. Sealed and endorsed tenders to be sent to H. Revell Phillips, clerk to the Council, Shifnal, by 11 a.m. on Mar. 26.

Mar. 26. Penarth.—*Supply of road metalling and gravel* up to the 31st Mar. 1907, for the Urban D. Council. Tenders to be marked "Tender for Broken Stone and Gravel." Forms of tender and further particulars may be obtained on application from Edgar J. Evans, A.M.I.C.E., surveyor, District Council Offices, to whom samples and sealed tenders are to be sent not later than noon on Mar. 26.

Mar. 27. Gateshead.—*Cement path work* in position on various roads or streets as may be required for one year. Tenders are to be sent in sealed and endorsed "Cement Path Work," to W. Swinburne, town clerk, Gateshead, by 2 p.m. on Mar. 27.

Mar. 26. Skegness.—*Laying of sewers*, with all appurtenances thereto, in the following streets:—Franklin Avenue, Ocean Avenue, Derby Avenue and Clifton Road, for the Urban D. Council. Plans and specifications can be seen at the office of Ralph Hudson, Surveyor to the Council, Skegness; and copies of the bills of quantities and forms of tender obtained on deposit of 10s. 6d. Separate tenders to be sent in for each street. Sealed tenders, endorsed "Tender for Private Street Works," must be delivered to Gilbert J. Dasher, clerk to the Council, Council Offices, Skegness, by noon on Mar. 26.

Mar. 26. Ashford.—*Haulage of rock* from Great Chart Quarry, Earl's Quarry, Aldington and Brett's Quarry, Willesborough, for the East Ashford Rural D. Council. Form of tender, with conditions, to be obtained of T. W. Pullen, surveyor, Kennington. Sealed tenders to be addressed to the Chairman and delivered at the workhouse, Willesborough, by 9 a.m. on Mar. 26.

Mar. 27. Rushden.—*Granite and slag* during the year, for the Urban D. Council. Specification and forms of tender may be obtained on application to the Surveyor. Tenders, endorsed "Road Materials," must be delivered to W. B. Madin, C.E., engineer and surveyor, Vestry Hall, Rushden, Northants, by Mar. 27.

Mar. 27. King's Lynn.—*Road materials*, for the Corporation. Particulars can be obtained on application to J. H. Webb, borough surveyor, to whom sealed tenders, on forms to be supplied, must be delivered not later than Mar. 27.

Mar. 27. London, N.W.—*Road-making and paving works* in the following roads:—Briar Road, Cricklewood; Crownhill Road, Harlesden, for the Willesden D. Council. Plans and specifications may be seen and all further particulars obtained upon application to O. Claude Robson, M.I.C.E., engineer to the Council, Public Offices, Dyne Road, Kilburn, N.W. The tenders, upon printed forms and endorsed "Private Streets," to be delivered at the offices of the Council not later than 4 p.m. on Mar. 27.

Mar. 27. Colwyn Bay.—*Making-up Highfield Road* and the passage leading therefrom to Grove Park, for the Urban D. Council. Plans, specifications, &c., may be seen and bills of quantities obtained on application to William Jones, A.M.I.C.E., Engineer and Surveyor, Council Offices, Colwyn Bay. Sealed tenders endorsed "Highfield Road Contract," addressed to the Chairman of the Highways Committee, to be delivered at the Council Offices by noon on Mar. 27.

Mar. 27. Poole.—*Supply of materials, also for haulage and horse hire* during the year ending Mar. 31, 1907, for the borough council, as follows:—Granite, quartzite, Mendip stone, coarse gravel, fine gravel, horse hire in Branksome District, haulage of granite from Borough Wharf to Branksome Depot. Further particulars and forms of tender may be obtained on application to S. J. Newman, F.R.I.B.A., borough surveyor, Borough Offices, King Street, Poole, to whom sealed tenders are to be delivered before 9 a.m. on Mar. 27.

Mar. 28. Cranbrook.—*Road materials* for the Rural D. Council as follows:—No. 1—900 tons of broken Guernsey granite. No. 2—460 tons of broken Cherbourg Quartzite. No. 3—770 tons of unbroken rag by rail. No. 4—2,380 yds. of unbroken rag to be supplied and delivered on roads at the parishes of Cranbrook, Frittenden, Benenden and Goudhurst. Tenders for any other sort of material will not be considered. Forms of tender and full particulars may be obtained of the clerk. Applicants must state which form of tender (1, 2, 3, 4) they require. Tenders must be sent to T. H. Crampton, clerk, Cranbrook, Kent, by Mar. 28.

Mar. 28. Ramsgate.—*Private street works*. Plans and specification can be seen on application to the Borough Engineer at his office between 10 and 4. Tenders, endorsed "Tender for Private Street Works," and addressed to the Chairman of the Works Committee, are to be delivered at the Borough Engineer's Office before noon on Mar. 28.

Mar. 28. London, S.W.—*Making-up the carriage-way of Woodlawn Road, Section IV*. Plans and specifications of the works may be seen and any information obtained from Francis Wood, M.I.C.E., F.G.S., borough surveyor, Town Hall, Fulham, S.W. The contractors are to attend personally or be represented at the Council meeting on Mar. 28 at 7 p.m., to deliver their own tenders, together with a £10 note and a schedule of prices, upon which the value of any extras or omissions shall be based, and to make a declaration that they pay the trade union rate of wages, observe such hours of labour as are generally accepted as fair in their trade, and that all unskilled labour shall be paid the minimum wage of 7d. per hour.

Mar. 29. Guildford.—*Road materials*, for the Corporation. Forms of tender may be obtained on application to the borough surveyor, C. G. Mason, A.M.I.C.E., Tuns Gate, Guildford. No tender will be considered except upon the prescribed form. Tenders, endorsed "Tender for Road Materials," are to be sent to F. S. Miller, town clerk, Town Clerk's Office Guildford, by noon on Mar. 29.

Mar. 29. London, S.E.—*Paving with natural mineral rock compressed asphalt* (exclusive of concrete foundation) the carriageways of certain streets, for the Lambeth Borough Council. Specification and forms of tender, together with any requisite additional information, can be obtained at the office of Henry Edwards, C.E., borough engineer, 346, Kennington Road, S.E., between 10 and 4 (Saturdays excepted). The Council is unable to state specifically the area of carriageways which it is prepared to pave with asphalt for the duration of the contract, but particulars as to the average quantity of asphalt paving laid in past years can be obtained from the Borough Engineer. Sealed tenders, endorsed "Tender for Asphalt Paving," must be delivered at the office of Henry J. Smith, town clerk, Lambeth Town Hall, Kennington Green, London, S.E., by noon on Mar. 29.

Mar. 29. West Hartlepool.—*Road material and leading* same as per particulars from W. Burton, road surveyor, Billingham, via Stockton-on-Tees. Tenders to be endorsed and delivered to George Kilvington, clerk to

the Rural D. Council, Union Office, West Hartlepool, by noon on Mar. 29.

Mar. 29. Castleford.—*Works of improvement* in Eastfield Lane, in accordance with plans and specifications prepared by W. Green, surveyor to the Council, from whom full particulars can be obtained. Sealed tenders in plain envelopes, endorsed "Eastfield Lane," to be sent to H. H. Broadbent, clerk to the council, Council Offices, Castleford, by noon on Mar. 29.

Mar. 29. Newmarket.—*One thousand tons of the best broken granite metalling*, broken to pass all ways through a ring 1½ ins. in diameter, for the Urban D. Council. Forms of tender can be obtained on application to S. J. Ennion, clerk to the Council, Deva Chambers, Newmarket, to whom tenders must be delivered, together with samples, not later than noon on Mar. 27, endorsed "Road Metalling."

Mar. 31. Uttoxeter.—*Granite, limestone, slag and team labour*, for the Rural D. Council. Full particulars are contained in the form of tender, including places for delivery of materials, estimated quantities, and names of parishes for team labour. Tenders to be sent in on forms to be obtained from the Surveyor, G. E. Mullah, New Street, Uttoxeter, to F. S. Hawthorn, clerk to the Council, Uttoxeter, by Mar. 31.

Mar. 31. Bredwardine.—*Hauling materials*, for the Rural D. Council. Forms and particulars can be obtained from the surveyor, H. B. Hamar, Bricklands, Hay. Tenders must reach Charles Griffiths, clerk to the Council, Hay, Breconshire, by Mar. 31.

Mar. 31. Chester.—*Carving macadam* and other materials for the main roads, for the year, for the County Council. Forms of tender and particulars of material to be carted can be obtained at the County Surveyor's Offices, Chester Castle, between 10 and 5, and on Saturdays between 10 and 1. Tenders, to be endorsed "Tender for Carting," to be delivered at the said office on or before Mar. 31.

Mar. 31. Sandwich.—*425 tons 1½ in. broken granite and 25 tons chippings* of the following:—Guernsey, Norway and Quenast, at per ton, to be properly broken and clean; 1,055ft. lineal 6 by 12 Norway edge kerb, at per foot lineal, to be properly dressed ready for laying; 655ft. lineal 12 by 6 Norway channel, at per foot lineal, to be properly dressed ready for laying. All broken granite will be weighed on the Sandwich Quay weighbridge. The weight of granite so weighed and the weight as certified for by such will be conclusive and the basis on which payment will be made. No other weights accepted. No forms of tender issued. Sealed tenders, marked "Tender for Road Material," to be delivered at the Town Clerk's Office (also samples, carriage paid) not later than Mar. 31.

Mar. 31. Croft.—*Supply of broken and unbroken whinstone* during the next twelve months at the following stations:—Croft, Eryholme, Picton, Fighting Cocks, Barton and Piercebridge, for the Rural D. Council. Tenders should be sent to Charles H. Leach, clerk to the Council, Union Offices, Darlington, by Mar. 31.

Mar. 31. Chelmsford.—*Norway granite herb and setts, and York stone edging*, for the County Council. Forms of tender, with the special envelope in which the tenders are to be delivered, and all other information and particulars, can be obtained at the Chief Surveyor's Office at Chelmsford. Tenders to be delivered to Percy J. Sheldon, M.I.C.E., chief surveyor, Chelmsford, by Mar. 31.

Mar. 31. Pocklington.—*Supply of best blue stone and slag* for repairing the roads, for the Rural D. Council. Forms of tender, with particulars, can be obtained from T. Robson, clerk, Pocklington, to whom tenders must be sent by Mar. 31.

April 2. Beckenham.—*Making-up* the following roads, viz.:—Studdall Road (68 yds. in length), Christ Church Road (50 yds. in length), Westfield Road (200 yds. in length), for the Urban D. Council. The works comprise about 700 lineal ft. of Norwegian kerb, 850 lineal ft. of three-set Aberdeen or Guernsey channel, 180 cub. yds. of hardcore, 300 cub. yds. of flints, 650 sq. yds. of red-brick paving, and 420 sq. yds. of limestone tar paving, together with the remodelling of 318 lineal yds. of roadway and other works incidental thereto. Plans and sections may be seen and bills of quantities, specifications and form of tender obtained on application to John A. Angell, surveyor, on the production of a receipt from the collector (who attends his office daily from 9 to 1 only, except on Tuesdays, when his hours are from 9 to 1) for a deposit of £1. Fair wages clause. Tenders, duly sealed and endorsed "Tenders for Street Works," to reach F. Stevens, clerk to the Council, by 4 p.m. on April 2.

April 3. Bromley.—*2,200 yds. of Norwegian granite edge kerb* and 470 tons of Guernsey granite setts, to be delivered as required at the Corporation Siding at the Bromley North Station, in accordance with the specification prepared by the Borough Engineer, which may be obtained on payment of 10s. 6d. Tenders, endorsed "Tender for Kerb, &c.," must be delivered to Frederick H. Norman, town clerk, Bromley, Kent, by April 3.

April 3. Epsom.—*Supply of materials*, carting of materials and for watering during the year ending 31st March 1907, for the Rural D. Council. Particulars and forms of tender may be had on application to T. E. Ware, surveyor to the Council, Waterloo Road, Epsom. Sealed tenders, endorsed "Tender," are to be delivered to W. O. Reader, clerk, "Lonsdale," Epsom, by April 3.

April 4. Woodhall Spa.—*450 tons of granite (XX)*, to be delivered at Kirkstead or Woodhall Spa Railway Stations during the months of July, August and September next in such quantities and at such times as the Urban D. Council or their surveyor shall require. Tenders to be received by J. E. Chatterton, clerk to the Council, Church Lane, Horncastle, by April 4.

April 4. Ticehurst.—*Materials for the Rural D. Council*, for one year, as follows:—900 yds. or tons broken Cherburg quartzite, or other approved granite; and about 1,920 yds. broken Sevenoaks stone. Forms of tender may be obtained upon forwarding stamped addressed envelope to the surveyor, W. N. Wood, Ticehurst, Sussex. Sealed tenders, endorsed "Tender for

Material," and samples of material, should be forwarded (carriage paid) to reach J. C. Lane Andrews, clerk to the Council, Council Offices, Wadhurst, Sussex, not later than April 4.

April 7. Magor and St. Mellons.—Broken limestone and gravel, for the Rural D. Councils. Specifications and forms of tender, with statement of quantities required, may be obtained on application at the Union Offices, Newport. Sealed tenders, endorsed "Tender for Metalling" to be received by Ithel Thomas, clerk, Union Offices, Queen's Hill, Newport, Mon., not later than April 7.

April 7. Wrotham.—Stone and cartage, for the Urban D. Council. Conditions of contract may be inspected and forms of tender obtained upon application to A. J. H. Powell, Surveyor to the Council, Borough Green, Sevenoaks. Tenders, which must be on the forms supplied, sealed and endorsed outside "Tender for Road Material or Cartage," must be sent to George F. Carnell, clerk of the Council, 130, High Street, Sevenoaks, by April 7.

April 10. Ashford.—Supply and delivery of gravel, surface-picked flint and Kentish rag-stone, for the parishes of Bethersden, Great Chart, Little Chart, Charing, Egerston, Hothfield, Kingsnorth, Pluckley, Smarden, Shadoxhurst and Westwell, and for the haulage of granite from Headcorn, Pluckley, Hothfield, Charing and Ashford Railway Stations; also from Great Chart Siding. Full particulars and forms of tender may be obtained from the Surveyor's Office, Charing. Sealed tenders, endorsed "Highway Materials and Haulage," addressed to the Chairman of the Rural D. Council, are to be delivered at the Union House, Westwell, Ashford, not later than April 10.

April 11. Helmsley.—Supply of whinstone and slag for repaving the roads, for the Rural D. Council. The stone to be delivered in such quantities and at such times as the Council may order. Forms of tender, with estimated quantities and particulars, can be obtained from Robert Pearson, clerk, Helmsley, to whom tenders must be sent by April 11.

SANITARY.

Mar. 24. Nelson.—Revolving screening apparatus, for the Sewage Works. Plans and particulars may be obtained from B. Ball, A.M.I.C.E., borough engineer, Nelson. Tenders, endorsed "Screening Apparatus," must be sent to J. H. Baldwick, town clerk, Town Hall, Nelson, by Mar. 24.

Mar. 26. Pontypridd.—Construction of gin. and 12 in. stoneware pipe sewers at Pwllgwaun (800 yds.) and gin at Treforest (420 yds. and 200 yds.), Hawthorn (85 yds.), and Upper Boat (160 yds.), together with the necessary manholes and other works in connection therewith, for the Urban D. Council. Plans and specifications may be seen and bills of quantities and form of tender obtained on application at the office of P. R. A. Willoughby, A.M.I.C.E., engineer and surveyor to the Council, upon deposit of £1 rs. Tenders, on the prescribed form, sealed and endorsed "Sewer Extensions," must be received by J. Colenso Jones, clerk to the Council, District Council Offices, Pontypridd, by Mar. 26.

Mar. 27. London, N.W.—Collection, removal and disposal of house-refuse for a period of one year, for the Willesden D. Council. Specifications and forms of tender may be obtained, upon receipt of 5s. for each tender form, upon application to O. Claude Robson, M.I.C.E., engineer to the Council, Public Offices, Dyne Road, Kilburn, N.W. Tenders to be delivered to Stanley W. Ball, clerk to the Council Public Offices, Dyne Road, Kilburn, N.W., by 4 p.m. on Mar. 27.

Mar. 27. London, N.W.—791 ft. lineal, or thereabouts, of 3 ft. brick barrel surface water culvert near Gladstone Park, Willesden, N.W., with manholes and all other works incidental thereto, for the Willesden D. Council. Plans and specification may be seen and all further particulars obtained upon application to O. Claude Robson, M.I.C.E., engineer to the Council, Public Offices, Dyne Road, Kilburn, N. Tenders, upon printed forms to be obtained from the Engineer and endorsed "Culvert, Gladstone Park," to be delivered at the offices of the Council not later than 4 p.m. on Mar. 27.

Mar. 28. Northallerton.—Laying of about 415 yds. of 9 in. sanitary pipe sewer and 110 yds. of 6 in. sanitary pipe sewer, together with the construction of the necessary manholes, ventilating shafts and interception tanks in the village of Brompton, near Northallerton. Plans and specifications can be seen at the clerk's office between 10 and 4. Tenders, endorsed "Tenders for Brompton Drainage," to be sent to W. Fowle, clerk to the Council, Northallerton, by noon on Mar. 28.

Mar. 29. Chippenham.—Sewage pumping plant, consisting of two oil engines and two centrifugal pumps at the sewage pumping station, for the Urban D. Council. Particulars may be obtained from A. E. Adams, A.M.I.C.E., borough engineer, Chippenham, Wilts, upon payment of £1 rs. Tenders to be sent in not later than Mar. 29.

Mar. 30. Hull.—Sewer along the north side of the Town Hall, between Lowgate and Quay Street. Forms of tender and other particulars may be obtained at the City Engineer's Office. Tenders, endorsed "Tender for Sewer," are to be addressed to the Chairman of the Works Committee, and delivered at the Town Clerk's Office before noon on Mar. 30.

Mar. 31. Barrow-in-Furness.—Alterations and improvements required at the Thwaite Street and Rawlinson Street school conveniences. Bills of quantities may be obtained at the Borough Engineer's Office, Town Hall. Tenders to be delivered not later than noon on Mar. 31.

Mar. 31. Greetland.—Bacteriological tanks, filters, carriers and other appurtenant works. Drawings may be seen and copies of the specification, bill of quantities and form of tender may be obtained at the office of the Engineers, R. E. W. Berrington & Son, Bank Buildings, Wolverhampton, or at the Council Offices, Greetland, upon payment of £5 ss. Sealed tenders, upon the forms supplied, endorsed "Tender for Sewage Tanks and

Filters," must be delivered at the office of A. T. Longbottom, clerk to the Council, 4, Carlton Street, Halifax.

April 2. Burley-in-Wharfedale.—Alterations and additions to the sewage-disposal works, including the building of a pumping station fitted with oil engines, centrifugal pumps, liquefying tanks and continuous filters, in accordance with the plans and specifications prepared by the engineers, Haller & Machell. Plans and specifications may be seen and form of tender and bills of quantities obtained at the offices of the Engineers, Corporation Chambers, Dewsbury, on the payment of a deposit of £2 2s. Seated tenders, on form supplied, and endorsed "Sewage-disposal Works," must be delivered at the Clerk's Office, 5, Ramsey Terrace, Otley, not later than noon on April 2.

April 3. Leigh.—9 in. stoneware pipe sewer, about 233 yds. in length, near the Green, Leigh, Tonbridge. Drawing and specification may be seen at the clerk's office. Sealed tenders, and endorsed outside, must be sent to George F. Carnell, clerk of the Rural D. Council, Sevenoaks, by April 3.

April 4. Watford.—Re-drainage of houses, 1-47, Fearnley Street, for the Watford Urban D. Council. Persons desirous of tendering for the work may see the drawings and specification, &c., at the offices of the Council, 14, High Street, Watford. Sealed tenders, endorsed "Tender for Fearnley Street Drainage," must be delivered to H. Morten Turner, clerk to the Council, Council Offices, Watford, by April 4.

April 7. Monmouth.—Works of drainage, with necessary manholes, &c., at the union workhouse, for the guardians of the poor of the Monmouth Poor Law Union. Plans, specification and conditions of contract may be seen and form of tender obtained at the Union Offices, Monmouth, or at the offices of Ernest G. Davies, M.S.A., Hereford and Monmouth, architect to the Guardians. Sealed tenders, which must be on the form obtainable as above and endorsed "Union Drainage," to be sent to T. A. Williams, clerk to the Guardians, Union Offices, Monmouth, by April 5.

April 7. Allerton Bywater.—Drainage, for the Tadcaster Rural D. Council.—Providing and laying of glazed earthenware pipe sewers, with manholes, &c., the erection of a pumping station, with storage tank, and cast-iron rising main; and the laying-out of about five acres of land, and the erection of contact filters thereon, for the sewerage and sewage-disposal of Allerton Bywater, in accordance with plans and specifications prepared by J. Simmons, M.I.C.E., Bank Chambers, Doncaster. Plans and specifications may be seen and forms of tender obtained at the offices of the Engineer on payment of £2 2s. Sealed tenders, endorsed "Tender for Allerton Bywater Drainage," to be delivered to G. A. Bromet, clerk to the Council, Tadcaster, by noon on April 7.

April 30. Middleton.—Three circular tanks, catchpits, conduits, &c., at the Sewage Outfall Works at Rhodes, for the Corporation. Plans may be seen and specifications, quantities and form of tender (which includes a fair wages clause) obtained, on and after April 5, by applying to W. Welburn, borough surveyor, at the Town Hall, between 9.30 and 10.30 a.m., on depositing £1 rs. Tenders, endorsed "Tender for Tanks," are to be addressed to the Chairman of the Surveyor's Committee, and delivered to Frederick Entwistle, town clerk, Town Hall, Middleton, by April 30.

MISCELLANEOUS.

Mar. 24. Gateshead.—Supply of the following materials for one year, for the Borough Council:—Whinstone macadam, Whin setts, Whin chips, Whin curb, Whin channel, Whin wheelers, limestone macadam, Freestone and Caithness flags, metal gullies, manhole covers, &c., shovels, picks, scavenging brooms, lime and cement. Specification and form of tender can be obtained at the office of N. Percy Pattinson, borough surveyor, Town Hall. Tenders are to be sent in, sealed and endorsed "Tender for Materials," by Mar. 24.

Mar. 24. Heywood.—Supply of the following materials, for the Corporation, for a period of twelve months:—Setts, flags and curbs (flagrock); earthenware pipes, bends, junctions and taper pipes; traps and gullies; pitch and creosote oil; limestone chippings; hand-broken granite and granite chippings; Portland cement (British manufacture); waste-water closets. Samples and specifications may be seen and form of tenders obtained on application to J. Ainsworth Settle, A.M.I.C.E., borough engineer. Applications should be made before Mar. 22. Fair wages clause. Sealed tenders, endorsed in accordance with the specification, must be delivered to G. G. Bouchier, town clerk, Municipal Buildings, Heywood, by Mar. 24.

Mar. 26. Chatham.—Supply of the following materials, for the Town Council:—1,300 tons of 2½ in. broken granite or other hard stone for macadam, 200 tons ½ in. granite chippings, 2,000 cub. yds. 2½ in. surface-picked flints, 200 tons 6 in. Kentish rag stone headers, and 500 super. yds. of 2½ in. best tooled Yorkshire paving. Also for the supply of 370 yds. lineal continuous unclimbable wrought-iron fencing (with gates). Specifications, stipulations, schedules and forms of tender can be obtained, samples of the granite chippings and Kentish rag stone headers seen, and drawings of the fence inspected on application to Charles Day, the borough surveyor, Town Hall, Chatham. Sealed tenders, on the forms supplied, endorsed "Tender for Road Material" or "Fencing," as the case may be, to be delivered at the Borough Surveyor's Office, Town Hall, Chatham, before 10.30 a.m. on Mar. 26.

Mar. 26. Cleckheaton.—Fireclay goods for the Urban D. Council, as follows:—Retorts, 22ins. by 15ins. by 10ft.; bricks best fire at per 1,000; bricks, best Silica at per 1,000; bricks, best specials at per 1,000; best ground fire clay at per ton. Alternative prices to be given for delivery at the Lancashire and Yorkshire Railway Station, Cleckheaton, or at the Council's Gas Works, Dewsbury Road, Cleckheaton. Sealed tenders endorsed "Tenders for Fire Clay Goods," to reach John H. Linfield, clerk to the Council, Town Hall, Cleckheaton, by noon on Mar. 26.

Mar. 26. Nuneaton.—Supply of the following materials, for the Rural D. Council:—Blue bricks, kerbs, &c.; disinfectants; earthenware pipes, &c.; granite kerbs and setts; iron castings and Portland cement. Conditions of contract and forms of tender may be obtained on application to F. C. Cook, surveyor, Council Offices, Nuneaton, to whom sealed tenders, endorsed "Tenders for Supplies," should be delivered by noon on Mar. 26.

Mar. 26. Little Hulton.—Supply of the following material, for the Urban D. Council:—Broken granite, granite and grit setts, granite and limestone chippings, grit curbs, artificial flags, stoneware pipes and gullies, cement, steam-rolling and scarifying, disinfectants, pitch and oil. Forms of tender and particulars can be obtained from J. H. Heyes, clerk, Council Offices, Little Hulton, any day between 9 a.m. and 5 p.m. Tenders, sealed and endorsed "Tender for —," are to be delivered at the Council Offices not later than 4 p.m. on Mar. 26.

Mar. 26. London, N.—Supply of the following materials, for the Southgate Urban D. Council:—3,000 tons (more or less) of granite, and carting. Also for the supply and delivery of such of the following goods as may be required from time to time to the 31st day of March, 1907:—Glazed stoneware socketed pipes; glazed stoneware sewer pipes with special watertight joints; Portland cement; cast- and wrought-iron goods; brooms, tools and ironmongery; paints and oils. Specifications of each class of goods required, forms of tender and any other particulars may be obtained on application to C. G. Lawson, C.E., the Council's surveyor. Separate sealed and endorsed tenders must be delivered to W. M. Ellenor, clerk to the Council, Council Offices, Palmer's Green, N., by noon on Mar. 26.

Mar. 26. Frome.—Supply of the following stores, for the Urban D. Council:—Portland cement; lias lime; broken granite; broken limestone; picks, shovels, forks and other tools; manhole covers and street gratings; pennant kerbing; Keinton channelling. Specifications, forms of tender and further particulars may be obtained on application to F. W. Jones, surveyor, the Public Offices, Frome. All tenders to be sent in on the forms provided, and sent addressed to the Chairman of the Sanitary Committee, the Public Offices, Frome, and endorsed "Tender for —," by noon on Mar. 26.

Mar. 27. Belfast.—Plumbing work and electric lifts at the Technical Institute. Plans and specifications may be obtained on application to the architect, S. Stevenson, 83, Royal Avenue, on payment of a deposit of £2 2s. for each set. Tenders to be endorsed "Tender for —," and lodged in the Town's Clerk's Office before noon on Mar. 27.

Mar. 27. Sowerby.—Supply of the following material, for the Urban D. Council:—Setts, Lancashire or Yorkshire; kerbs, Lancashire or Yorkshire; flags, Lancashire or Yorkshire; pitch; brooms; team labour; general repairs. Forms of tender can be obtained on receipt of a stamped and addressed foolscap envelope from the Engineer. Tenders to be sent to C. L. Whitehead, C.E., engineer, Council Offices, Sowerby Bridge, Yorks, by Mar. 27.

April 2. Bognor.—Flints, gravel, cement, road rolling and timber, for a period of twelve months from 31 Mar. 1906, for the Urban D. Council. Specifications and all information may be obtained from Oswald A. Bridges, council surveyor, Bognor. Tenders, accompanied by samples, and endorsed "Tenders for Supplies," to be delivered to Henry Layton Staffurth, clerk to the Council, Council Offices, Bognor, by April 2.

April 2. Manchester.—Supply of the following stores, for the Lancashire and Yorkshire Railway:—Brushes; colours; crucibles; gas and water fittings; iron castings (water pipes); lead; paper-maché panelling; screws; signal and telegraph fittings; signal, telegraph and electric light wires; springs (spiral); steel cotters and pins; steel plates (Siemens); steel (sheets, &c.); steel tubes for boilers; steel tubing (cold and hot drawn weldless); wire; wire rope, way materials; crossing timber; fencing (arch); sleepers. Further particulars and forms of tender may be obtained on application to Duffin, Stores Department, Osborne Street, Manchester, where parties are requested to call and examine the samples before tendering. The sample-room will be open for this purpose from Mar. 19 to Mar. 31 inclusive, between 10 and 4; Saturdays 10 to 12. Contractors cannot be allowed to tender to their own patterns, nor can the Company's patterns be sent away for inspection, all being sealed and exhibited at Osborne Street. Tenders, properly endorsed and addressed to the Directors, must be lodged with the Secretary not later than 10 a.m. on April 2. Separate forms of tender will be provided for each contract; parties applying are therefore requested to state the particular contract for which they propose to submit tenders.

April 2. Newburn.—Erection of about 600 cub. yds. of concrete walling at Bell's Close, together with about 180 lineal yds. of cement coping thereon. Erection of about 180 yds. of strong iron palisading at Bell's Close, and about 1,200 yds. of light palisading at Lemington and Newburn. Particulars may be had from Thomas Gregory, the engineer to the Council, at his office, Newburn. Tenders to be endorsed "Tender for Wall" or "Tender for Rails," as the case may be, and sent to George Wilkinson, clerk to the Council, 1, Mosley Street, Newcastle-on-Tyne, by noon on April 2.

April 4. Glasgow.—Supply of the following stores, for the Tramways Committee of the Corporation:—Axles, steel tyres and steel wheels; bolts and nuts, dog spikes, &c.; chilled iron brake blocks, car wheels, &c.; brushes; paint brushes; cartage; cast-iron castings; malleable iron castings; cast-steel castings; engineers' furnishings; fireclay goods; glass; granite and whin chips; ironmongery; iron and steel; lime and cement; oils; paints, &c.; pitch and pitch oil; plumbers' material; sand; timbers; tie-bars; wrought-iron tubes and fittings; varnish, and galvanised wires. Samples, where specified, can be seen at the Purchasing Department, 46, Bath Street, Glasgow. Specification and form of tender for any of the above can be obtained on application to James Dalrymple, general manager, 46, Bath Street, Glasgow. Sealed offers, marked "Tramways—Tender for —," must be lodged with A. W. Miles, town clerk, City Chambers, Glasgow, by 10 a.m. on April 4.

Tenders.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, Great New Street, Fetter Lane, E.C. Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Sycamore Works, Ltd., Wimbledon	516		
G. R. Wells,* Weybridge	510		
F. Deakin & Son, Addlestone	492		

* Accepted. † Withdrawn.

Bankruptcies.

(Abbreviations: R.O.—receiving order; P.E.—public examination; C.C.—county court; O.R.—official receiver; Adj.—Adjudication.)

DURING THE WEEK ending March 16th twenty-six failures in the building and timber trades in England and Wales were gazetted.

L. P. BARKER, stonemason, Bedford. R.O. March 7th.
J. P. WOOLCOCK, builder, Penryn. Deficiency £376.
G. TOWNSEND, builder, Barnes. R.O. March 6th.
H. M. COX, contractor, Brixton. Adj. March 6th.
W. THEOBALDS, architect and surveyor, London. Liabilities £346; assets £10 10s.
E. J. COX, window-glass merchant, London. Liabilities £1,008; assets £481.
T. H. HARDING, builder and contractor, Derby. Liabilities £14,573; assets £856.
W. R. & J. H. WALKER, builders, Smethwick. Liabilities £719; assets £12.
H. GALLETT, builder and contractor, Wyde Green. Deficiency £311.
J. BLAND, builder and contractor, Appleby. Adj. March 6th.
T. B. LAMB, builder and contractor, Fulwood. Gross liabilities £11,671; to rank £1,735; assets £1,242.
T. EMUSS, builder, Droitwich. Gross liabilities £1,183; expected to rank £545; assets £75.
C. H. FLACK, architect and surveyor, London. R.O. March 9th.
J. READING, builder and contractor, Barnes. R.O. March 6th.
M. H. PEART, surveyor, &c., Tottenham. Adjourned examination, Edmonton C.C., March 6th, at 11.30.
G. H. SANDERS, contractor, London. P.E., London Bankruptcy Court, April 10th, at 11.
J. H. G. FOSTER, timber merchant, London. P.E., London Bankruptcy Court, April 26th, at 11.30.
A. HOOKHAM, builder and decorator, Willesden Green. First meeting, London Bankruptcy Court, March 26th, at 12. P.E., same, May 3rd, at 11.30.
J. PENNINGTON, builder and contractor, St. Helens. First meeting, O.R.'s, Liverpool, March 22nd, at 11.30. P.E., Liverpool C.C., March 26th, at 11.
F. W. TURNER, painter and decorator, Horsforth. First meeting, O.R.'s, Leeds, March 21st, at 11. P.E., Leeds C.C., April 2nd, at 11.

PRICE & REES, painters and house decorators, Swansea. First meeting, O.R.'s, Swansea, March 23rd, at 12. P.E., Swansea Town Hall, April 20th, at 11.30.

C. E. NICHOLLS, builder, Barlow Grange (late Cuthorpe). First meeting, Angel Hotel, Chesterfield, March 23rd, at 12.15. P.E., Chesterfield C.C., April 20th, at 2.

The Journal of the Institute of Sanitary Engineers, Vol. IX., Part I., January to June 1905, has just been issued. The council of the Institute has decided to publish the journal at half-yearly intervals, instead of annually as hitherto, and after the proceedings of last year have been dealt with the regular issues of the journal will be in January and July, each dealing with the transactions of the preceding half-year. This year also two other numbers will be issued in June and October. The price of the journal is 1s. It is obtainable at the office of the Institute, 19, Bloomsbury Square W.C.

Bournemouth Municipal Buildings.—At last week's meeting of the Bournemouth County Borough Council considerable discussion took place in regard to the proposed scheme for municipal buildings, of which Messrs. C. E. Mallows and F. W. Lacey are the joint architects (see BUILDERS' JOURNAL, Nov. 22nd, 1905). The architects had been requested to alter their scheme so as to reduce the cost. An amendment that the matter should be referred back to committee to bring up a report as to the feasibility of an open competition for the work was ruled out of order, and the committee's recommendation of the revised scheme (inclusive of the dome but not furniture) to be carried out at a cost not exceeding £100,000 was adopted by 22 votes to 6.

HALL'S

SANITARY WASHABLE DISTEMPER

The Modern Wall Covering.

The most popular wall covering of to-day is Hall's Sanitary Washable Distemper. It works easily, sets hard and dries with a uniform surface, equal to flatted oil paint.

It is made in 73 colours, including rich dark as well as light shades.

One cwt. of Hall's Distemper mixed with water to the consistency of cream, will cover double the surface of one cwt. of pure White Lead Paint and save 40 per cent. of the cost of labour.

'Sisco' White Japan is the correct material for painting Doors, Picture Rails, and all Woodwork of rooms decorated with Hall's Distemper. 'Sisco' Japan is a pure white decorators' enamel, which dries with a hard, smooth lustrous surface. It lasts for many years with beauty unimpaired.

Samples and full particulars on application to
SISSONS BROS. & Co., Limited,
HULL,
Manufacturers of Colours, Varnishes, Paints and all materials for Decorators' use.
London Office—
199a, Boro' High Street, S.E.

ROYAL ACADEMY EXHIBITION, 1906.

THE sending-in day for architectural works is Friday, March 30th, from 7 a.m. to 10 p.m. as hitherto. Will architects let us have their drawings as early as possible.

Appointments Wanted.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterward, prepaid. Three insertions may be had for the price of two. Advertisements must reach the Office not later than 5 o'clock on Monday.

A JUNIOR ASSISTANT disengaged; 3½ years' experience; 1st class certificate advanced construction. Working drawings and details; short-hand.—S., 35, Culverden Road, Balham. 1697

ADVERTISER (30) desires RE-ENGAGEMENT in architect or consulting engineer's office. Fifteen years' London experience in heavy construction work and preparation of specifications. Quick and accurate draughtsman. Highest references.—E. HOFF, 245, Barcombe Avenue, Streatham Hill. 1715

ADVERTISER requires position as Manager to a firm of Builders and Contractors.—Box 1700, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

ARCHITECT'S ASSISTANT, good draughtsman, steady and reliable, satisfactory references; moderate salary.—"Nonconformist," Box 1712, BUILDERS' JOURNAL Office, 6, Great New Street, E.C.

ARCHITECT'S ASSISTANT desires RE-ENGAGEMENT, 9 years' varied experience. Design, perspectives, surveying, levelling, &c. Salary £125.—Box 1688, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

ARCHITECT'S JUNIOR ASSISTANT, 3½ years' experience. Good knowledge construction, details.—C., 15, Blenheim Street, Chelsea. 1705

ARCHITECT and SURVEYOR (Young) is prepared to assist in the preparation of contract and competition drawings; also surveys for dilapidations and alterations, &c. 10 years' London experience. Terms moderate.—E. C., 100, Archway Road, N. 1685

ARCHITECTURAL ASSISTANT (27) desires re-engagement. Nine years' varied London and Provincial experience. Design, details, working drawings, perspective, &c. Excellent testimonials. Moderate salary.—Address Box 1716, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

ASSISTANT OR MANAGER to Plumber and Decorators, or Shopfitters, or Clerk to Builders. 6 years' experience; good ability and education. Age 27.—Box 1734, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

BRICKLAYER.—Alterations, Sanitary Work, Kitchens, Stoves, Tiling, Pointing, Slating, and Repairs. Good references; would take low wages for a regular job.—J. ALVEY, 16, Convent Gardens, Notting Hill. 1729

BUILDER'S ASSISTANT (22), 3 years with Architect as pupil, 7 months with Builder, requires permanency; plans, specifications, estimates for repairs, &c.; 25s. to commence.—W. S. D., 14, Gladstone Road, Broadstairs. 1706

BUILDER'S CLERK (23) seeks engagement; 6 years' experience general office routine; salary moderate; town or country.—Box 1695, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

BUILDER'S CLERK or ASSISTANT (40) DISENGAGED, long experience; drawing, quantities, measuring-up, levelling, supervision of work, &c.; country preferred.—L. J. G., 88, Adelaide Road, Shepherd's Bush, London. 1721

BUILDERS—ELECTRICAL WIRING WORK WANTED, carcass or otherwise, by competent workman. Hour, day, or job.—E. ARNOLD, 30, St. James Road, Bermondsey, London. 1732

CLERK OF WORKS, age 34. Town or country. Thoroughly experienced in all branches, abstainer, moderate salary. Good references and testimonials.—R., 103, Colworth Road, Leytonstone, N.E. 1690

FOREMAN OF PAINTERS AND DECORATORS seeks engagement. Head or working. Good manager. Steady, practical, and reliable. Colourist. Age 36. Town or country.—T., Market House, Fleet, Hants. 1731

GENERAL FOREMAN seeks RE-ENGAGEMENT. Trade, Bricklayer. Experienced in London Board School work, and other first-class jobs. Good references; smart and energetic.—Address, W. A. M., 21, Caxton Road, South Wimbledon, S.W. 1693

GENERAL or WORKING FOREMAN wants re-engagement; shop or outside. Conversant with allied trades. Steady and reliable; trade, carpenter and joiner.—HARRY HEMS, 7, Park Grove, Bromley, Kent. 1692

MONUMENTAL MASON requires SITUATION (South). Good Letter Cutter and Carver. London experience. Moderate salary. Photos of work.—Box 1710, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

PAINTING and PAPERHANGING (piece-work) WANTED by practical man. Any quantity, any distance. Or as Working Foreman of Painters.—W., 117, Dunlace Road, Lower Clapton, N.E. 1711

PAPERHANGER, good, wants piecework. Distance no object.—C. MARKHAM, 11, Great Sutton Street, Clerkenwell, E.C.

PAPERHANGER wants PIECEWORK. Best or commons. High relief a speciality.—C. HODSOLL, 1, Medley Road, West Hampstead, N.W. 1730

PAPERHANGING. WILLIAM STAN-NARD & SONS, 10, Portland Road, Paddington, W., carry out every description of Paperhanging in all parts of London and provinces. Best workmanship, moderate prices, prompt attention. 1653

PATENT FIRE-PROOF FLOORINGS.—Wanted Agency for Ireland from makers of above pavements.—Address, Box 1735, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

PLUMBING, HOT WATER, STEAM WORK WANTED.—Any quantity, anywhere. Estimates from plans or quantities.—THOS. ORSBORNE, 4, Woodlands, Isleworth, W. 1719

REPRESENTATIVE having connection with Architects and Builders in Bournemouth and district desires additional appointment for part time.—H. P. S., Southcliffe Lodge, Exeter Road, Bournemouth. 1727

SAWYER and SAW SHARPENER (all round) wants job; used to gutting machine.—Address A. E. C., 103, Mallinson Road, Clapham Junction. 1705

WANTED.—Berth for a capable, energetic HANDY-MAN, as Time or Storekeeper or any position of trust. Good knowledge of Building trade.—D., 447A, Blenheim Terrace, Kingston Road, Merton, Surrey. 1709

WOOD CARVER, young, seeks employment. Good experience in Gothic.—Address S. R., c/o 13, Northcote Terrace, Kirke White Street, Nottingham. 1689

WORKING FOREMAN (Carpenter and Joiner) wants JOB; day or piecework. Distance no object. Abstainer. Age 30.—ORMESBY, Harrington Road, S. Norwood. 1714

WORKING FOREMAN OF PAINTERS and DECORATORS. Long and varied experience; energetic and reliable; good references.—Box 1733, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

WORKING SHOP FOREMAN of Joiners requires Situation in a small Machine Shop, good reference, also good setter-out and manager of men, Age 36.—Address, T. M., 14, Hartington Road, Lower Edmonton. 1728

Drawings, Tracings &c.

ASSISTANCE rendered in the preparation of Architectural Drawings, &c., at advertiser's own address.—Box 1717, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

DRAIN PLANS PREPARED.—JOHN LAWRENCE, Jun., M.R.S.I., A.I.S.E., 112, Shirland Road, W.

DRAUGHTSMAN (24), experienced in London work, wishes to assist architects, builders, and surveyors. Working drawings, tracings, perspectives, &c., neatly got out. Terms, 1s. per hour or by agreement.—"Mac," 140, Ladywell Road, Lewisham, S.E. 1708

DRAUGHTSMAN seeks SITUATION, freehand, perspective, mechanical, water-colour, photography, moderate terms.—D., 6, Hazel House, Sulgrave Road, W. 1691

PERSPECTIVE ARTIST prepares ink or colour drawings; moderate terms.—L. C., 11, George Street, Halifax.

Offices &c. Wanted & To Let.

TO ARCHITECTS.—Centrally situated OFFICES excellently lighted back and front, large floor space 35 feet square; moderate rental. Full particulars on the premises, 274, Edgware Road, near Met. Station.

TO YOUNG ARCHITECTS.—Share of Architect's (A.R.I.B.A.) furnished offices adjoining Bedford Row can be acquired at nominal rent.—Box 1720, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

Appointments Vacant.

BUILDER'S ASSISTANT WANTED, good French scholar, for building operations in France. Send full particulars and salary required to Box 94, at HORNCastle's, 61, Cheapside, E.C.

SURVEYOR'S ASSISTANT required to take charge of small branch office at a country town in Sussex. Must be competent quantity surveyor (London system), with knowledge of architectural drawing, specifications and land surveying. Temporary appointment at first with permanency if suitable.—Apply, stating age, qualifications, experience, salary and copies of testimonials to Box 1725, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

WANTED at once, **DRAUGHTSMAN** who thoroughly understands Reinforced Concrete and Structural Steel Work. State qualifications, experience, age, and salary wanted. All applications treated in strict confidence.—Write H. S., c/o HASTINGS Bros., Ltd., 1, Arundel Street, Strand, W.C.

WANTED, by an old-established firm of Manufacturers in London, a capable and energetic REPRESENTATIVE, acquainted with Builders, Contractors, and Engineers, to travel in part of London and Suburbs, and other places. Not more than 35 years of age. Unexceptional character and gentlemanly appearance. Remuneration, partly salary, partly commission. Good permanent post for suitable man.—Apply in first instance, with copies of testimonials, and stating remuneration required, to "MANUFACTURERS," Box 1678, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

Businesses Wanted & For Sale

BRICKWORKS. AS A GOING CONCERN. LOW RESERVE.—Bordon Camp, Hants. A new and rapidly growing important Military Centre. For Sale privately or by auction on April 18th, "Kingsley" Brickworks (the nearest to the Camp), comprising over 12 acres of freehold land, with an abundant supply of excellent clay. Has never been pushed, but an output of about half a million bricks has been done, and this by introduction of machinery could be greatly increased, with a ready sale always in view.—Double tenement cottage. Important road frontages. Also in separate lots 3 pairs of new and a pair of old cottages. Station (Bentley) 2½ miles, 42 miles from London. Particulars and conditions of sale may be obtained of Messrs. Hind and Sons, 28, New Bridge Street, 26 and 122, Cannon Street Road, E., and of the Auctioneer, Reginald C. S. Evennett, F.A.I., Haslemere and Farnham, Surrey.

HARROGATE.—JOINER'S and UNDERTAKER'S BUSINESS. Established nearly 50 years. Gas Engine, Planing Machine, Circular and Band Saws, &c., also Stock at valuation.—Apply TOPHAM Solicitor, Harrogate.

Miscellaneous.

A. J. ARROWSMITH, 22, Mount Street, B. Berkeley Square, London, W. Wood Mantelpieces, Panelling, and Parquet Flooring.

BOGNOR.—To Let, Furnished House (or Apartments).—Apply, FRENCH, "Lansdowne," Esplanade, Bognor.

DUMPY LEVEL, 14 inches, by Troughton and Simms, staff and leather case, £8; also leather pocket case electron drawing instruments, 15s.—AVERY, Swindon Lane, Cheltenham.

FOR SALE.—Ballast, Hoggin, Sand, and Mould.—Apply DAVY, Oliver Road, Leyton, Essex.

"GRANDMASTER".—Grove Flanged Draught Chimney Pot. Noiseless, efficient.—PARKINSON, Greenhill Road, Armley, Leeds.

VENTILATING and HEATING EXPERTS.—ACME VENTILATING and HEATING Co., Tarleton Street, Liverpool.

WANTED about 40,000 g by 4½ by 1½ blue or red vit diamond pattern paving tiles delivered Whitehaven. Quotations to L. FERGUSON, Builder, Harrington, Cumberland.

WORKSHOP STOVE, heating 20,000 cubic feet, only £2.—TUCKER, 143½, Euston Road, N.W. Telephone: 2955 Central.

YORK Stone Sills, Steps, Templates, and other worked stone cheap. Send for price list.—KELLY & Co., Stone Merchants, Mill Hill, N.W., and Kilburn, N.W.

Reinforced Concrete. OUR regular readers will recollect that we were among the first in this country to realize the possibilities of reinforced concrete construction, the innovation and exploitation of which was due firstly to the French, and secondly to the Americans and Germans. We have devoted considerable space to the subject, and we are glad to say that at last our efforts, and those of other workers in the field, have attracted the attention of the Institute, which, at the instance of its Science Standing Committee, has just appointed a joint committee, formed of members of the Institute and other bodies interested, to draw

up rules for the guidance of architects in the use of reinforced concrete. The committee, which is presided over by Sir Henry Tanner, is made up as follows:—Representatives of the R.I.B.A.: Messrs. A. T. Walmisley, William Dunn, Max. Clarke, H. D. Searles Wood; District Surveyors' Association: Messrs. Thomas Henry Watson and E. Dru Drury; Institute of Builders: Messrs. Benjamin I. Greenwood and Frank May; Incorporated Association of Municipal and County Engineers: Messrs. A. E. Collins and W. Cockrill; War Office: Colonel C. B. Mayne and Major E. M. Paul, R.E.; other members: Prof. W. C. Unwin and Mr. Charles F. Marsh. There are a good many points for this committee to consider, and we trust that they will seek the assistance of the firms who have been pioneers in this work, and not rely upon the theoretical investigation which a few members of the committee are known to have made. Without acquaintance with actual conditions and actual work no practical conclusions can be hoped for. There is in the possession of the specialist firms a vast amount of knowledge which the members of the committee do not possess, and this knowledge is necessary to an adequate understanding of the subject. It is true some of the most eminent French engineers have written books which have been translated into English, and received accretions of knowledge which have thrown light on the details of the subject, but it is not too much to say that all the books, however recent, are somewhat behind the best practice. Apart from the question of calculating reinforced concrete members, there are a good many points of practical interest that it is important to have settled—for instance, the amount of concrete which it is necessary to place below the reinforcing rods to give full protection against fire. Then again there is the question of the protection of the enclosed steel from corrosion and disintegration. It is generally accepted without question that steel is protected by concrete. This is true if the concrete is good, but the question for settlement is, what precautions must be taken to ensure that the steel is protected under certain conditions? Portland-cement is made of several ingredients, and it is important to know the proportions which ensure protection and the proportions which do not. The slag cements and foreign natural cements on the market are very unreliable, and it is most important that we should, by testing, be able to discover whether any particular cement is suitable for reinforced concrete. Again, what would be correct in ordinary situations in buildings of ordinary character might be quite wrong for those exposed to such adverse influences as obtain in chemical works, where there are acids, or at works throwing off steam, and in positions where sea-water may come into contact with them, as pavilions on piers or the piles and decking of jetties, &c. Our

attention has just been called by Mr. C. J. Dawson, F.R.I.B.A., to the decking at the shore end of Southend Pier, which was constructed about fifteen years ago of small joists embedded in breeze-concrete. This was recently taken up, and it was found that the joists had been badly rusted. The reason, however, may have been that the cement was poor and perished by the action of sea water, or that the concrete, being composed of breeze without any filling material for the pores, such as sand, was porous, and let water and carbonic acid in solution penetrate to the steel; or the breeze may have been cracked on the under side of the joists by excessive deflection due to overloading. Such practical experiences as these require fuller investigation, but they serve to point out that there are conditions which may cause a very different result to that anticipated. Other points which the committee should investigate are the reinforcement of beams against shear, and the advantage to be gained by the rigid attachment of the stirrups or shear members to the bottom bars; the effect of temperature and moisture in the atmosphere upon the setting of cements; and the properties of the various aggregates, and the proportions for concretes to meet various requirements.

A Breach of Faith. We understand from sources which leave no doubt as to their reliability that the Office of Works proposes to still further interfere with the late Mr. Brydon's fine design for the new public offices in Whitehall, by abandoning the construction of the other three towers. Whether this is due to some parsimony on the part of the Government or to an abrogation of taste by some official we do not know, but it is scandalous that there should be any further meddling with the work of an eminent architect to whose memory it is only due that we should carry out his design in its entirety. His interest in this building and the energy he devoted to it undoubtedly shortened his life, and it is not right to thus slight his memory by shearing his design of such prominent features as these towers would be. The action of the Office of Works in this matter seems to be farcical, for not only has almost all the stone for these towers been worked, but it is actually delivered, the scaffold has been erected, and a new hoist purchased for the carrying out of the work. The builders' profit will have to be paid, and it is stated that the cost of carting and storing the stone will be more than that of constructing the towers.

ROYAL ACADEMY EXHIBITION, 1906.

THE sending-in day for architectural works is Friday next, March 30th, from 7 a.m. to 10 p.m. as hitherto. Will architects who have not already forwarded their drawings let us have them at once.

First-floor Plan.

SELECTED DESIGN FOR CORONER'S COURT, MORTUARY AND DISINFECTING STATION AT DEPTFORD, LONDON, S.E.
HORACE T. BONNER, A.R.I.B.A., ARCHITECT. (For particulars see p. 166.)

THE ARCHITECTURAL ASSOCIATION.

Mr. Soames on the London Club-house of Last Century.

A MEETING of the Architectural Association was held at 18, Tufton Street, Westminster, on Friday evening, the chair being occupied by the president, Mr. E. Guy Dawber, F.R.I.B.A.

The president announced the house list for the session 1906-07, the president-elect being Mr. R. S. Balfour, and the vice-presidents Messrs. Walter Cave and A. Needham Wilson. The elections will take place on April 27th.

The president also announced the resignation by Mr. A. Maryon Watson of the honorary secretaryship owing to ill-health, and the thanks of the Association were accorded to him for his past services.

Mr. W. Kaula was elected a member of the Association, and the following further donations to the Building Fund were announced:—

	£	s.	d.
Horace Cheston	-	5	0
Walter Gilbert (further donation)	-	2	2
F. Dare Clapham (double subscription)	-	1	1
A. T. Bolton	do.	0	10
W. Millard	do.	0	10
D. Newman	do.	0	10
H. Y. Boreham	do.	0	10

Votes of condolences to relatives of the late Mr. Zephaniah King, Mr. Lancelot Simmons and Frank Whittingham were passed.

A paper on "The London Club-house of Last Century," by Mr. A. W. Soames, M.P., was then read by the secretary, Mr. D. G. Driver, Mr. Soames being abroad.

In this paper a brief list was first given of the chief social clubs that had been founded in the metropolis, beginning with the Bread Street Club, originated by Sir Walter Raleigh, then going on through the eighteenth and nineteenth centuries, and concluding with the Conservative Club (1840), which may be said to terminate the earlier period of club building, as in the next quarter of a century comparatively few new clubs were founded; indeed, the bulk of the newer clubs belong to the last twenty years of the century.

The Innovation of the Smoking-room.

The evolution of the club-house, as might be expected, reflects changes in our social habits. Two, at any rate, of the older club-houses—the Athenæum and the United University—when built contained no smoking-room. It was not until 1857 that Thackeray succeeded in persuading the committee of the Athenæum to allow smoking on the premises. In the case of the United University (1822) it was found necessary to add a third floor in order to provide a smoking-room. This house, which was built by Wilkins, the architect of the National Gallery, has lately been pulled down, and a new club-house is being erected on the site by Mr. Reginald Blomfield, A.R.A.

The Growth of Bedrooms.

The greater facilities for travelling have had their effect on the clubs, which have not only increased in number but also in size, and within the last few years it has become usual for clubs to provide bedrooms for members, which was only the case in a few of the old clubs, where perhaps a dozen might be found. The modern political club, such as the National Liberal or the Constitutional, with its 108 bedrooms, is really more like an hotel than the old-fashioned club. Consequently we find that, whereas the Carlton Club (1832) and Conservative Club (1840) have only one floor above the ground floor, the Constitutional runs into six storeys; moreover, the last-named cost £200,000, while the Travellers' (1819) was built for the modest sum of £23,160 and the Athenæum (1824) cost no more than £34,239.

Ubiquitous Stucco.

Two circumstances may be noticed which had a considerable influence on the early clubs, the one beneficial and the other adverse. The removal of Carlton House, which faced the bottom of Waterloo Place, gave some excellent sites, now occupied by the United Service (Senior), Athenæum, Travellers', Reform, &c., but, unfortunately, the period was one when exteriors were almost invariably rendered in stucco or cement, and this detracts seriously from the appearance of nearly all the older clubs.

The Staircase.

Given a well-lighted and sufficient site, the planning of a club-house, of the earlier type at any rate, is not a very complex problem, and it is one that affords excellent opportunities to the architect. The hall and staircase naturally play an important part in the design, but, with a few notable exceptions, the designers of our club-houses have not made the most of their opportunities in this respect. In many cases we find a spacious hall with an ample staircase, but the effect of the whole completely destroyed by the approach being at one side of the hall and not opposite the staircase. A notable instance is the United Service Club. The Army and Navy, too, has a large florid staircase, similarly placed and planned, except that the central flight, instead of descending in an unbroken line to the ground floor, branches right and left shortly before reaching the ground, with a questionable effect. In the Conservative Club also the effect of a somewhat remarkable hall and staircase is diminished by a side approach in one corner of the hall.

The treatment of the stairs in the National Liberal Club is somewhat unusual, the stairs ascending round an oval well; the result, however, is not particularly happy.

The Most Successful Treatment

of the hall and staircase is found in the Athenæum. The plan is both simple and effective. The site is a regular oblong, about 103ft. by 79ft. This space is divided into three portions by walls parallel to the shorter sides, of which the middle part, occupied by the hall and stairs, is considerably the largest, being roughly two-fifths of the whole. The entrance hall, which is only one storey in height, is divided by irregularly-spaced colonnades somewhat in the manner of a basilica, with a low segmental coffered ceiling over the nave and flat ceilings to the aisles. At the end of this hall, which is somewhat dimly lighted by windows at the side of the main entrance, is seen a broad and lofty flight of stairs, branching right and left and returning on both sides, the whole flooded with light from above. This plan of lighting is very pleasing, and the effect of the whole is very good.

Lighting.

The lighting of large rooms 20ft. high or more is a matter of some little difficulty. The older architects for the most part frankly gave up any attempt to produce a window that would reach anywhere near the top of their rooms, and took refuge usually in a coved ceiling. As these clubs mostly occupy positions where there is a good light, and their rooms are not very wide, Mr. Soames said he was not sure that they were not right. Certainly the elevations gained in solidity and dignity by having sufficient wall-space, where it is not frittered away or overloaded, and the attempt to use very large windows in the New University, Junior Constitutional, National Liberal Club, &c., is not so successful as to be likely to induce anyone to follow their example.

The majority of the large club-rooms are, of course, lighted from the side, but the coffee-room at the Oxford and Cambridge (65ft. 10ins. by 32ft.) is lighted by lofty

windows at both ends; this method of lighting, however, does not give a pleasing effect.

Some of the earlier clubs, e.g., the Athenæum and United Service, have the ground floor very little raised above the street level, but it was a very usual practice in later houses to raise the ground floor a few feet higher, and so get a fairly well-lighted mezzanine to provide lavatories and offices.

Alcoves.

One of the principal objects of the designer of a club is to provide three or four rooms on a large scale which shall have some architectural character and look comfortable withal. Mr. Soames held, then, that the ideal room for a club, whether it be coffee-room, drawing-room, library or smoking-room, is one which provides a considerable number of nooks or recesses, where little coteries can assemble or where a quiet table for reading or writing can be placed. Nothing gives an air of less comfort to a coffee-room than a bare space of straight wall with an interminable row of little tables set against it, all of the same size and shape. For that reason the room should be broken into bays, with columns and antæ of ample projection. An excellent instance of this is the library at the Travellers'—

the most Charming Room

in any club in London. The dimensions are 65ft. by 22ft. 6ins. The central bay is lighted by three grouped windows, and the end bays by one each. Slender coupled shafts stand well away from the antæ on pedestals connected to them, and 7ft. or more from the side walls. The entablature is returned across the room over these shafts, and the effect is most happy.

In Barry's later house, the Reform, we find a similar arrangement. Here the coffee-room and library are each about 117ft. by 27ft. and 20ft. high, and are divided again into three bays and recesses at each end. But here, instead of a single entablature crossing the room, Barry has separated his bays by two entablatures about 10ft. apart, with a soffit between at a lower level than the ceiling, and carried in the one room on single columns in antis and in the other on coupled shafts on pedestals standing boldly away from the walls. This arrangement gives additional nooks for small tables, and somewhat disguises the excessive length of the room in proportion to the width. Both rooms are very successful, the library being second only to that in the adjoining house.

The L-shaped Room

was not employed in any of the older houses, but it is not to be despised for a club. A more sociable method of entertaining strangers is to allow them the use of the smaller arm of such a room, instead of relegating them to a badly-lighted and stuffy little back room, as is so often their unhappy lot in the older and less spacious club-houses. The Union has recently made an alteration to its coffee-room, and adopted this plan, and two good examples of L-shaped rooms are to be found at the Junior Carlton.

The Reform Club.

As a piece of architecture Mr. Soames put the Reform Club, by Barry, first in order of merit. The plan is very simple. The main building is a rectangle 120ft. by 105ft., and in the interior is a covered courtyard 56ft. by 51ft., surrounded by a colonnade of Ionic pillars on unmoulded pedestals supporting a gallery, above which a Corinthian colonnade carries the roof. This arrangement gives a perfectly symmetrical, dignified and spacious interior, but the effect is a little marred by the interlacing cove lantern light, apparently of cast-iron. The use also of scagliola for the columns and wall-surface is to be regretted. The plans of the ground floor and first floor are almost identical. On the south there is on both floors a room about 117ft. by 27ft.; on the west one of 50ft. by

25ft., plus a 7ft. recess; and on the north or entrance side and east or staircase side smaller rooms.

The Other Clubs.

Following the Reform, Mr. Soames dealt with the numerous other clubs—the Travellers' (also by Barry), the Pall Mall elevation of which was said to have been suggested by the Pandolfini Palace, at Florence; the Athenæum, by Decimus Burton, ruined beyond redemption by the unfortunate addition of a third floor set-back 7ft. or 8ft. inside the main walls of the building (the continuous balcony at the first-floor level is one of the rather unusual features of this building); the Oxford and Cambridge Club, by Robert and Sydney Smirke, built in 1836-7 at a cost of no more than £26,743 (though it cannot be considered particularly happy either in plan or elevation); the Conservative Club, a building of some dignity, with one of the most successful fronts (the plan gives a fine room to the front, and there is a spacious coffee-room behind); the United Service Club, which, though not of any striking originality, has a massive air and is not inappropriate to a club of warriors; the Junior United Service, with its main entrance boldly placed out of the centre of the façade, thus securing a fine room with a large bay on the east (the impression, however, of the whole is one of heaviness without dignity, and the end elevation to Regent Street, with its windows of varying heights and shapes, is particularly unfortunate); the Army and Navy Club, by Parnell & Smith, completed in 1851 at a cost of £54,000 (owing some of its features to the Palazzo Rezzonico, on the Grand Canal in Venice and its upper storey to Massuri; the exterior is not unimposing, but one could have wished for a little more plain surface for the eye to rest upon); the Carlton Club, an elaborate one—somewhat too elaborate, in fact, the surface being worried and cut up till there is hardly a square foot of plain work to give repose to the eye (the polished granite columns, too, afford an unpleasant contrast to the stone, especially as the surface of the stonework is now unfortunately disintegrating badly); the Junior Carlton, a building which, originally designed by David Brandon and opened in 1860, has been completely remodelled by Mr. Macvicar Anderson (the elevations, however, are wanting in style, and of no particular interest); and the Garrick, designed by F. W. Marrable and opened in 1864.

The More Recent Buildings.

Of the huge buildings that have been more recently erected for political clubs Mr. Soames said it was difficult to speak in terms of much commendation. The National Liberal Club has certainly more architectural character than the Constitutional or the Junior Constitutional, but, while fully admitting that the site was a difficult one, Mr. Soames said it was impossible to avoid feeling that more might have been made of it.

The Constitutional Club occupies perhaps an even more awkward site, and it has not been successfully dealt with. Terra-cotta, too, is a poor material for a building on so large a scale, though even a better material would not have redeemed it. The Junior Constitutional cannot, however, be said to suffer from a poor material, nor does the frontage to Piccadilly offer any difficulties, but a marble front will not carry off a poor design, and this one is quite wanting in breadth and dignity.

With regard to all these three, the question arises whether buildings so lofty and on so large a scale can be satisfactorily treated with gables. Mr. Soames said he was inclined to doubt it. He thought more emphasis to the horizontal lines was required than could be obtained with such a treatment.

DEPTFORD CORONER'S COURT, MORTUARY, &c.

THE design of Mr. Horace T. Bonner, A.R.I.B.A., for coroner's court, mortuary and disinfecting station at Deptford (illustrated on p. 164 of this issue) has been selected in a limited competition, two other architects besides Mr. Bonner having been invited to submit designs. The arrangement of the buildings gives complete classification and entire isolation to the several departments, effecting economy and convenience in working. Special attention has been devoted to the coroner's requirements and direct access is given for the jury's "viewing." All the mortuary buildings are lighted from the north and none are overlooked—an important point. The coroner's court is spacious and lofty, being 34ft. by 21ft. by 23ft. high—ample height being essential in such a court in order to avoid any "stiffness." The coroner's seat and desk are placed on a raised dais or bench, similar to that in a court of law, with witness box to the right and jury to the left. The coroner's room adjoining is 16ft. by 12ft., with lavatory and w.c. opening out of it. The witnesses' room is placed at the front of the building, affording convenient access to the court and so saving witnesses, when called, having to struggle through a crowd. There is a lavatory for women adjoining this room and sanitary conveniences for men close by, but entered from outside the building. A special passage-way for jurors is provided to enable them to pass direct to and from the jury box to the mortuary to "view." The caretaker's apartments are placed over, on two floors, comprising six rooms, namely, sitting-room 14ft. by 12ft., kitchen 13ft. by 12ft., scullery and bathroom 13ft. by 7ft., two large bedrooms, one small bedroom, with pantry, coal store and w.c. There is an asphalted flat over the top floor.

The public mortuary buildings are entirely detached, having a convenient mourners' or waiting room, a spacious viewing lobby with air-tight window, mortuary and post-mortem room.

The mortuary is 25ft. by 20ft., and is lighted from the north (thus keeping out the sun's rays and so maintaining a cool temperature). It is proposed to be faced with glazed tiles or bricks, and has an open iron roof with lantern light; the doors are placed at an angle so as not to be seen from the entrance gate. The post-mortem room adjoining measures 23ft. by 16ft. 6ins., and is lighted from the top and from windows in the north wall, with surgeons' room and lavatory opening out of it. The mortuary for infectious cases is placed apart and has separate viewing lobby with air-tight window. The disinfecting department is on the back frontage, in Baildon Street, and has wide gates for vans or carts. It is so arranged that articles to be disinfected are received at the south end and passed out at the north end. The receiving room is 31ft. by 20ft., separated by a solid wall (with air-tight window) from the disinfecting chamber—which is 27ft. by 20ft., top lighted and ventilated, and fitted with two "Equipex" or other approved disinfectors, and a steam boiler of about 15 to 18-h.p., with small brick chimney. The delivery-room is proposed to be finished in Parian cement and enamelled white; roofs and ironwork being similarly finished. The stable is in a convenient corner of the yard, containing one stall and one loose-box, harness-room, store-rooms, w.c. and urinals. Adjoining is the van shed, providing accommodation for two large vans as well as hand ambulances. The isolation shelter consists of two separate flats, on the ground and first floors respectively, with separate entrances and yards to each. The cost of the buildings is put at about £4,000.

NOTES ON COMPETITIONS.

Proposed new School, Colchester.

A striking illustration of the troubles which befall promoters and competitors when the services of a professional assessor are dispensed with has been afforded by the proceedings of the Borough Council of Colchester as exemplified at a recent meeting. The council invited plans in what, it is to be presumed, was a limited competition, and three sets of designs were submitted. The Education Committee appears to have cherished the idea that a professional assessor was unnecessary, in view of the fact that the plan they proposed adopting would have to be approved by the Board of Education. Consequently they set to work with a light heart, and after wavering between the respective merits of two of the schemes, ultimately made a selection. Then the anger of the unsuccessful competitors was aroused and they both wrote protesting against the award, maintaining that the selected design did not comply with the requirements and was ill adapted to the site, and requesting that the services of an independent school expert should be requisitioned to assist the committee. A lively tussle ensued in council during the consideration of the Education Committee's recommendation that the selected plan be adopted, and an amendment that the three sets of plans be submitted to the judgment of an independent assessor was well supported, but not sufficiently to prevent the committee's recommendation being adopted. Of course there ought to have been an assessor, but this should have been looked to by competitors before the designs were assessed, and not after. It is hardly sportsmanlike to take part in a game the chances of which are known, and then to complain of being a loser. Competitions of this sort are always games of chance, although unfortunately for the rash ones who play and lose the stakes are high. *Experientia docet*; but competitors are stubborn pupils.

Proposed Baths, Jarrow.

This is another competition in which the elements of chance appear to play a large part. The whole of the conditions are comprised on a single sheet of foolscap. There is no mention of an assessor. The requirements are briefly stated as a swimming bath 75ft. by 30ft., twelve or fifteen slipper baths, provision for caretaker, necessary heating, washing and drying accommodation, and any special arrangements at the discretion of the architect. The council do not bind themselves to accept the cheapest scheme. There are no premiums, but the successful competitor will be appointed to carry out the work at the usual rate of remuneration. The building is to cost £3,000. It is to be hoped that the customary remuneration may be taken as 5 per cent., although, if the usual practice obtaining in the North is taken into account, there is room for doubt upon this point. In any case, the competition does not appear a desirable one to take part in, unless it can be ascertained that a competent assessor is to be appointed.

Proposed Infectious Diseases Hospital near Leuchars, St. Andrews, Fife.

There is a considerable element of chance also in this competition, inasmuch as no minimum of cost has been fixed, and the revised information to architects states that "it is proposed to remit the plans selected to a skilled assessor (measurer or architect)." There is an ominous look about all this. In the first place the plans selected are to be submitted to adjudication. There is no information as to whom they are to be selected by, but the conclusion is that this will be done by the Hospital Committee. They are then to be submitted to a "measurer or architect." A measurer is the Scotch term

for a quantity surveyor. What a measurer knows about hospital plans, goodness knows, but as he is mentioned in precedence to an architect, it is to be assumed that his services will be sought. St. Andrews is apparently relying upon the Local Government Board's memoranda as its safeguard, in the same way that Colchester hoped to shift its responsibility upon the shoulders of the Board of Education. In fact, the conditions for the hospital consist chiefly of the Local Government Board's memoranda as to the plans of hospitals for infectious diseases, and a list of additional information to architects issued by the Hospitals Committee. A contemporary journal recently stated, anent unsatisfactory conditions, that one rubs one's eyes and wonders whether it is really the year 1906, and whether the Competition Reform Society really exists. Truly, the lack of enlightenment shown by promoters of competitions, as well as of those who participate in them, is a cause for wonder, but one fails to see how the Competition Reform Society can prevent the issue of bad conditions; it can only endeavour to obtain their revision.

Elementary Schools at Sutton Coldfield.

Messrs. Crouch, Butler & Savage have been awarded the first place in the competition for new elementary schools in Victoria Road, Reddicap Heath and Green Lanes, Sutton Coldfield, and their design has been accepted by the Education Committee. Twelve sets of designs were submitted in the competition.

New Law Courts at Cape Town

Dissatisfaction with the award in the large competition for new law courts at Cape Town seems to exist in some quarters, for memorials on the subject have been addressed to the Government by the Cape, the Transvaal and the Natal Institutes of Architects. The complaint is that the design awarded the first place does not show its front entrance in Victoria Street, whereas this was particularly stipulated by the conditions. We understand, however, that the fullest consideration was given to the designs submitted, and that the award made is the right one. Mr. Mervyn Macartney, the assessor, acted in conjunction with a Government committee.

Competitions Open.

The following is a list of competitions open:—

DATE OF DELIVERY.	COMPETITION.
Mar. 31	BIRMINGHAM COUNCIL HOUSE EXTENSION (Sketch Plans).—£1 rs. deposit for conditions. Particulars from Birmingham Town Clerk, Council House.
" 31	DWELLINGS AT MILAN EXHIBITION.—Premiums £240 and £80. Particulars from the Exhibition Committee, Milan, Italy.
April 2	PUBLIC LIBRARY AT SOUTHWARK (to cost £7,000).—Premiums of £50, £30 and £20. £1 rs. deposit for conditions. Particulars from Mr. J. A. Johnson, Town Clerk, Town Hall, Walworth Road, S.E.
" 14	SCHOOL AT OSSETT.—Premium of £50 (to merge). Particulars from the Secretary at the Education Office, Ossett.
" 15	PEACE PALACE AT THE HAGUE.—Particulars from the office of the Carnegie Foundation, Noordeinde 33, The Hague.
May 31	NATIONAL CONGRESS HALL FOR BRAZIL.—Premiums of 15,000, 10,000 and 5,000 milreis (equivalent to about £1,685, £1,125 and £562 respectively). 5,000 milreis also for designs not pre-empted but desirable to be acquired. The conditions of the competition can be seen at the offices of the Commercial Intelligence Branch of the Board of Trade at 73, Basinghall Street, E.C.
No date	ISOLATION HOSPITAL AT STONE.—Limited to architects in the district. Particulars from Mr. J. J. Chapman, clerk to the Stone Joint Hospital Board, Stone, Staffs.
Date not stated.	BATHS, FIRE-STATION AND FREE LIBRARY AT REDDISH.—To cost £5,000. Applications by March 31st to Mr. Robert Hyde, Town Clerk, Stockport, for form of instructions to architects. Deposit £1 rs.

Enquiries Answered.

The querist's name and address must always be given, not necessarily for publication.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Correspondents are particularly requested to be as brief as possible.

The Clock Tower, Westminster.

Referring to the enquiry about this tower on p. 107 of our issue for February 21st, Mr. E. L. Schneider, of Upper Tooting, writes: "If querist will refer to the 'Building News' for December 31st, 1858, and to the 'Builder' for January 31st, 1857, he will find some useful illustrations reproduced from the working drawings of Sir Charles Barry's clock tower."

Construction of Steel and Concrete Floor

BRIGHTON.—R. G. writes: "Is the construction of a fireproof floor as shown by sketch (not reproduced) the best I could use for a span of 29ft. 6ins. between supports? I am rather pinched for headroom, and do not want the floor to be more than 15ins. overall, but according to my working out the floor would be 2ft. thick. Could I use smaller r.s.s.?"

If the floor below is to be kept clear of any obstruction by columns, then the main girders will have to be 18in. by 7in. by 75 lb. rolled steel joists, but, instead of resting the small cross-joists on the top flange, a considerable saving in headroom may be effected by constructing the floor as shown by Figs. 1 and 2. If there is no objection to a row of columns down the centre of the room below, then the main girders may be 10in. by 6in. by 42 lb. rolled steel joists, and the floor will then be as in Figs. 3 and 4. The cast-iron columns will each have to carry a load of about 18 tons, and, assuming them to be 14ft. long, they should not be less than 7ins. diameter and 3/8in. metal. It will be simpler to make the concrete with a 6in. parallel thickness, as shown, instead of arching it between the cross-joists as suggested. The floor-boards must not be laid until the concrete is perfectly dry unless some waterproof sheeting is interposed. Short pieces of angle instead of one continuous angle may be used to support the cross-joists.

HENRY ADAMS.

FIG. 4

STEEL AND CONCRETE FLOOR.

Books.

TAUNTON.—W. B. J. writes: "Which is the best text-book on undertaking?—I mean a book concerning funerals and how they are carried out, and prices also."

We endeavour to oblige all querists, though some of the questions they send are, to say the least, strange. But we must draw the line somewhere, and we draw it at funerals. We would refer "W. B. J." to the "Undertakers' Journal": but in putting his question elsewhere he would do well to make his last sentence less ambiguous, otherwise there may be a misunderstanding as to whether he wants to know the prices of funerals or of the books dealing with them.

Claim in respect of Specification Clauses.

ALLTWN writes: "(1) I have been erecting a small house by contract, and there is a clause in my specification which reads as follows: 'Supply and fix in sitting-room register grate and mantle p.c. £3 5s. (fixing extra) selected by the owner or the architect, and supply all necessary firebricks, &c., and mortar for setting same.' I am claiming an extra on the above in consequence of the two words in brackets, namely, fixing extra. The owners took upon themselves to purchase the grates and mantles without mentioning the matter to me, although the above clause say that I must 'supply, &c.' (2) 'Supply and fix to all openings requiring them red deal lintels 1in. deep for every foot span, but in no case less than 3ins. with 6in. bearing on walls at each end.' Do you consider a lintel a right and proper thing to specify over an opening 11ft. in the clear when there is a floor above and a gable over that of 16ft span? (3) What constitutes a girder, also a lintel?"

(1) (a) Words in a specification such as you quote undoubtedly mean that the contractor is to include in his tender the cost of fixing, and you are not justified in claiming "fixing" as an extra. The contractor is also to pay £3 5s. for a stove and mantelpiece. (b) The architect often purchases grates, &c., in the circumstances mentioned, and sends the bill to the builder for payment. (2) A red deal lintel for an 11ft. opening is not an unreasonable thing to require, and I am of opinion that in such a position a pair of 1in. by 3in. deals will form a more lasting job than the usually flimsy iron joists often used for such a purpose. (3) A "lintel" covers the top of a door or window opening. A "girder" carries a weight in any position. F. S. I.

Wesleyan Chapels.

In reference to the recent enquiry of "G. W. C.," Nottingham, Mr. C. R. Thickpenny, of Watford, writes: "Querist will find

illustrations and particulars of cost, &c., of recent Wesleyan chapels in the annual report of the Wesleyan Chapel Committee, printed by Messrs. Hayman, Christy & Lilly, Ltd., 113-115, Farringdon Road, E.C."

Computing Area of Irregular Plots.

SKEGNESS.—PYLON writes: "Kindly explain how to compute the area of a plot of land as shown by sketch by 'averaging' the side A B."

There are two ways of computing the area of irregular plots of land which might be described as "averaging." In the first method a fine black thread EF, Fig. 1, is stretched

over the carefully plotted plan and carefully adjusted so that the shaded area above EF is equal to the shaded area below EF. Then, if the angles ACD and BDC are right angles, bisect EF at O and draw GON parallel to CD. The area of the plot is equal to CD × DH. If the angles ACD and BDC are not right angles, then join BC, and from E and D drop the perpendiculars EK and DM on to BC. The area is then equal to $\frac{1}{2} BC(EK + DM)$. The line EF is called a "give and take line." The second method is as follows:—Divide the plot up into any convenient number of strips of equal width d , as shown in Fig. 2. Now if CV and RW be made each equal to $\frac{CA + RT}{2}$ it will be seen that the area of the strip ACRT will be approximately $\frac{CA + RT}{2} \times d$. Similarly the areas of the strips TRSU and USDB are approximately $\frac{RT + US}{2} \times d$ and $\frac{US + BD}{2} \times d$ respectively, whence by adding the three areas together the area of the whole plot will be $\frac{1}{2}(AC + BD + RT + US) \times d$, or, expressed as a general formula, total area = $\frac{1}{2}$ sum of first and last ordinate plus sum of intermediate ordinate × common width of strips. Only four ordinates have been taken in Fig. 2 for the sake of clearness, but greater accuracy may be secured by taking a greater number of ordinates. H. Y. M.

Cutting to Arches.

LONDON.—A SIX YEARS' READER writes: "What amount of cutting would there be in the following arches separately:—

	Openings.	Face.	Soffit.
	ft. ins.	ft. ins.	ins.
Semis	5 0	1 1½	4½
	3 6	1 1½	4½
	3 0	1 1½	4½
	2 6	1 1½	4½
Camber	2 0	0 9	4½

We take it that "Six Years' Reader" is a sub-contractor, and the results below are based on this assumption. For this reason fair cutting round the semi-arches is not included, nor skewbacks to the camber:—

Semi 5ft. oins.,	Face equals	-	roft. roins.
	Soffit	"	- 2ft. 1rins.
" 3ft. 6ins.,	Face	"	- 8ft. 2ins.
	Soffit	"	- 2ft.
" 3ft. oins.,	Face	"	- 7ft. 3ins.
	Soffit	"	- 1ft. 9ins.
" 2ft. 6ins.,	Face	"	- 6ft. 5ins.
	Soffit	"	- 1ft. 6ins.
Camber,	Face equals	-	2ft.
	Soffit	"	- gins.

Junior Draughtsmanship under Government.

GUILDFORD.—DRAUGHTSMAN writes: "Where can I get information about junior draughtsmanship (civil engineering) under the Government? What are the opportunities of a young man in such a position?"

There is only one appointment for junior draughtsmen open to competition, viz., that of temporary draughtsman in the office of the Inspector-General of Fortifications. Particulars of this examination can be obtained from the Civil Service Commissioners, Burlington House, London, W. The post of temporary draughtsman without an examination is to be obtained in the War Office and Admiralty; but there are already so many names of gentlemen who are waiting to fill vacancies upon the books of these departments that the possibilities of obtaining one of these appointments is very remote. Some five years ago the prospects of a draughtsman in the Admiralty were good, for the post of assistant civil engineer might have been taken by examination, but at present this department is so full of young men that even the possibility of another examination for one of these appointments within the next year or two is quite remote; and much more remote are the chances of promotion in this department. S. O. F. H.

Drawings of Vaulting.

In reference to the enquiry under this head on p. 129 of our issue for March 7th, Mr. Harry Hems, of Exeter, writes: "Some short reference to the vaulting at Salisbury Cathedral will be found in Bond's admirable book, 'Gothic Architecture in England' (1905), as well as a fine illustration, from the north-west, of that in its Lady Chapel (p. 173). The piers in the nave, with their central cylinders composed of small square stones, are touched upon (p. 246), and a sketch is given (p. 249) of the clustered supporting shafts, annulets and copper bands to piers. The groining at Bath is briefly mentioned (p. 240) as retaining the vaulting shaft in the piers, as at Worcester, Rochester, Chester, St. Saviour's, Southwark, York and Lichfield. There is no reference in the book to the vaulting at Manchester."

Construction of Stable.

PINNER.—STABLES writes: "At the rear of a street I have a vacant piece of land about 45ft. by 20ft. on which I desire to erect a stable, arranged for carriages on the ground floor, with hack horses on the first floor, and hayloft above; height from floor to ceiling, both for carriages and horses, 9ft. What would be the probable cost of the floor upon which the horses will stand, and what are the materials to be used?"

The usual method of constructing such a floor as you describe is by means of iron joists placed parallel and at from 4ft. to 8ft.

intervals. Between these joists cement-concrete arches are turned, and the whole is braced together by suitable iron tie-rods, and carried on stout brick walls, strengthened if necessary by piers. The cost should be about £6 per square (depending somewhat on local circumstances), and to this should be added the cost of the brick or other paving which is employed for the stalls, &c. F. S. I.

Determining Width of Flange.

WHITLEY FAY.—STUDENT writes: "Kindly give a formula for getting the width of a flanged plate girder when such width is not fixed by special conditions, such as the width of the wall the girder is supporting."

The conditions determining the width of flanges in plate girders will be found at page 40 of "The Practical Designing of Structural Ironwork" (Spon. 8s. 6d.). They are generally from $\frac{1}{20}$ to $\frac{1}{30}$ of the span in width. Steel girders are dealt with in "Designing Ironwork," 2nd Series, Part I. (Spon. 1s. 6d.). When the width of the compression flange is less than $\frac{1}{20}$ of the span, the working load per square inch should be reduced, to prevent risk of buckling, by the formula $s = s(1.2 - \frac{l}{100f})$, where s = standard stress

per square inch, l = length of span in inches, f = width of flange in inches, s = reduced stress per square inch to prevent buckling. The unsupported width of the flange plate beyond the angles should not exceed eight times the thickness, and there are other conditions to be complied with.

HENRY ADAMS.

Ventilating Floor Joists.

BIRMINGHAM.—X. writes: "In a case like that shown by the accompanying sketch, where the wooden joists of a floor run parallel to the only sides from which air could be admitted for ventilation, in what way should this be done, and is it absolutely necessary to ventilate the floors of upper storeys?"

As the fir joists run parallel with the only two walls through which ventilation can be obtained, no provision for air passage will be possible at the ends of joists, as is usually the case. The best arrangement will be as in Figs. 1 and 2, where 9in. by 3in. air-bricks are shown directly opposite the ends of the rolled steel joists. The air-bricks should be inserted close under the top flange of the joists. All floors should be ventilated, but this is practically impossible in upper floors with a single set of joists. Brandering on the underside will give a small space through which air may pass, but ceiling joists at right angles to the floor joists provide ample space. There should in all cases be air-bricks on opposite sides, to get a through draught.

NEW LONDON BUILDINGS.

AT yesterday's meeting of the London County Council the Building Act Committee reported the following applications under the London Building Act, 1894, their recommendations as to consent or refusal being appended in *italics*:—

Buildings on the northern side of Stanstead Road and western side of Ravensbourne Road, Lewisham, on the application of Norfolk and Prior, on behalf of J. Watt. (*Consent.*)

Extension of the periods within which the erection of buildings at Nos. 2 to 5, White Lion Street, Pentonville, was required to be commenced, on the application of S. H. Watson. (*Consent.*)

Extension of the periods within which the erection of an institute building for the Beaufoy Charity on the site of Nos. 65 to 71 (inclusive), and of eight houses on the site of Nos. 56 to 64 (inclusive), Princes Road, Kennington was required to be commenced and completed, on the application of F. D. Powell. (*Consent.*)

Extension of the periods within which the erection of a building on a site abutting upon the east side of High Street and north side of Limes Groves, Lewisham, was required to be commenced, and completed, on the application of W. Stephen. (*Consent.*)

Projecting oriel window in front of No. 16, James Street, St. Marylebone, on the application of Forsyth and Maule, on behalf of H. Friedeberg. (*Consent.*)

Additions in front of Nos. 49, 51, 53 and 55, Mansell Street, Whitechapel, on the application of Selby and Kislbury, on behalf of S. Harris. (*Consent.*)

Extension of the periods within which the erection of a two-storey building on land at the rear of Nos. 20, 22, 24 and 26, St. John's Road, Battersea, was required to be commenced, and for a deviation from the plan approved on 11th July, 1905, for the erection of the said building, so far as relates to the erection of an addition on the eastern side of the building, on the application of E. S. Barr, on behalf of Hillier & Parker. (*Consent.*)

Iron structure upon the forecourt of No. 205, Clapham Road, Brixton, on the application of J. H. Doughty. (*Consent.*)

Underground cellars in the forecourt of No. 13, Euston Road St. Pancras, and to a deviation from the plan approved on 4th July, 1905, for the construction of underground cellars in the forecourts of Nos. 15, 17, 19 and 21, Euston Road, St. Pancras, so far as relates to the omission of the steps in front of No. 15, Euston Road, on the application of W. Fleckhart, on behalf of Dr. Pavy. (*Consent.*)

Conservatory over the porch in front of No. 3, Albert Road, Regent's Park, on the application of E. C. Macpherson, on behalf of Mrs. Desmond. (*Consent.*)

Horticultural showhouse on the western side of Trinity Road, Wandsworth, to abut upon Magdalen Road, on the application of A. Southam, on behalf of R. Neal. (*Consent.*)

Bay windows in front of Nos. 9 & 11, Glenshiel Road, Eltham, on the application of J. J. Bassett, on behalf of A. Cameron Corbett. (*Consent.*)

Addition at the western end of Christ Church, Christ Church Street, Chelsea, on the application of the Rev. J. P. Thompson. (*Consent.*)

Projecting balconies at the southern end of the ward block of the Bolingbroke Hospital, Wandsworth Common, to abut upon Belleville Road, on the application of Young & Hall, on behalf of the Council of the Bolingbroke Hospital. (*Refusal.*)

Building on the southern side of Webber Street, Southwark, to abut upon Barron's Place, and to exceed in height the width of that street, on the application of A. E. Chasemore, on behalf of Mr. Sumption. (*Consent.*)

Addition to the London Hospital, Whitechapel Road, Whitechapel, at less than the prescribed distance from the centre of the roadway of East Mount Street, on the application of R. Plumbe, on behalf of the Committee of the London Hospital. (*Consent.*)

Two external iron gangways, over the roadway of Pump Court to connect Nos. 114 to 118, with Nos. 120 to 128, Union Street, Southwark, at the second floor and roof levels, and the erection of two iron balconies and two iron ladders at the rear of Nos. 114 to 118, Union Street, on the application of R. J. Lovell, on behalf of the General Electric Co., Ltd. (*Consent.*)

Addition at the rear of No. 57, Cadogan Gardens, Chelsea, to abut on Draycott Place, on the application of G. L. Wilson, on behalf of P. Holland. (*Consent.*)

Retention of a greenhouse in front of No. 229, King Street, Hammersmith, on the application of L. G. Brumby, on behalf of T. Grant. (*Consent.*)

Deviation from the plans approved on 23rd May, 1905, in connection with the rebuilding of No. 32, Rupert Street, and No. 6, Upper Rupert Street, St. James, so far as relates to an alteration in the position of an air duct, on the application of R. H. Kerr. (*Consent.*)

Amended drawings submitted by the Kensington and Notting Hill Electric Lighting Co., showing the details of the construction of the bunkers and other steelwork in connection with the proposed erection of a generating station on a site eastward of the generating station of the Central London Railway Co., and approached from Wood Lane, Hammersmith. (*Consent.*)

Amended plans submitted with the application of the City of London Electric Lighting Co., Ltd., for the construction of additions to the western power house of the Summer Street and Bankside generating station, Southwark. (*Consent.*)

New street for carriage traffic on the Summerfield estate, Catford, to lead from Ravensbourne Park Road to

NEW LIBRARY FOR ACCRINGTON. W. J. NEWTON, ARCHITECT.

The new Carnegie library at Accrington shown by the above illustration (for which we are indebted to the "Freston Guardian") is to be built on the Willow House site from designs by the borough engineer, Mr. W. J. Newton. On the ground floor there will be a newsroom fronting St. James's Street, with lending library at the rear, librarian's room, mending-room, boys' room, &c. The reference library is on the first floor, over the lending library, and is reached from the central hall by a well-lighted staircase; accommodation is provided for seventy persons, with book-stacks and shelving for 11,360 volumes. At the front on the first floor, over the news-room, is placed a large lecture-room. The walls of the building are to be of stone, faced with ashlar, the staircase of stone, floors to rooms laid with wood blocks, and hall, landings and corridors of mosaic or terrazzo. The cost of the library is estimated at £8,000. Building operations will be commenced shortly.

Ravensbourne Park, and in connection therewith the widening of portions of Ravensbourne Park Road and Ravensbourne Park, on the application of A. W. Ostorn, on behalf of J. Watt. (*Consent.*)

Deviation from the plans approved on 24th October, 1899, for the formation of Glenilla Street and Howitt Road (late Howitt Street), Hampstead, so far as relates to an alteration in portions of the boundaries of the said streets, on the application of C. J. Bentley, on behalf of J. C. Hill. (*Consent.*)

Addition on the half-landing between the first and second floors at the rear of No. 43, Cambridge Street, Hyde Park Square, on the application of Thurgate & Cope, on behalf of J. Asher. (*Refusal.*)

Uniting of No. 31, Westbourne Terrace with No. 19, Craven Road, Paddington, by an opening at the first-floor level on the application of Macey & Sons, Ltd. (*Consent.*)

The Theatres and Music Hall Committee also reported the following:—

Plan, submitted by the Town Clerk of the Royal Borough of Kensington, showing a proposal to provide a gas-heated plate warmer on the landing of the gallery staircase of the Kensington Town Hall. By the proposed arrangement the landing will be reduced in width from 7ft. to about 5ft. 6ins. The minimum width of the staircase will not, however, be reduced by the proposed alteration, and an undertaking has been given by the Town Clerk to the effect that the plate warmer shall only be used on occasions when dinners are being held in the large hall. (*Consent.*)

Plans with regard to the proposed arrangements of certain of the side shows in connection with the forthcoming Imperial Royal Austrian Exhibition to be held at the London Exhibitions, Earl's Court. The arrangements shown on the plans appear to be satisfactory. (*Consent.*)

Plans, submitted by A. O. Collard, of a proposed "Helter-Skelter Lighthouse," to be erected at the London Exhibitions, Earl's Court, in connection with the Imperial Royal Austrian Exhibition, and plans showing the construction of a tower and gateway in the portion of the Exhibition grounds known as "Elysia." (*Consent.*)

Obituary.

Mr. James Farquharson, builder, of Nairn, died recently.

OUR PLATES.

THE house at Maids Moreton, Bucks, was built about twenty-five years ago, as also the rectory at the same village, from the designs and under the superintendence of Mr. E. Swinfen-Harris, F.R.I.B.A., of London and Stony Stratford. The garden fronts of each of these houses have a south aspect, and command, in clear weather, fine views of the distant Chilterns. Both are near to the interesting old parish church, which has been frequently illustrated, with its unique western tower and vaulted west porch.

MORTAR.

By S. SMITH.

(Concluded from p. 159, No. 580.)

Mixing.

THE main object in mixing mortar is to get the sand and the lime thoroughly incorporated together, and to bring these ingredients to a thoroughly plastic state. It is necessary to add a further quantity of water to ensure this. The ancients said that "good mortar should only be tempered with the sweat of the mason." Hard work on the part of the man who is mixing the mortar improves it; the oftener the mortar is turned over and mixed together the less water is required to bring the mortar to a plastic state, and the more carbon dioxide is absorbed by the lime, with a beneficial or better-setting result. This difficulty is got over to a great extent by grinding the lime and sand together in a mortar mill.

There is one disadvantage of ground mortar, as compared with mortar mixed by hand: it is that the sand is all ground to the same degree of fineness, with a corresponding loss of strength to the mortar, as previously stated. Vicat recommended the use of a "stamping" machine for the mechanical mixing of mortar, in preference to a grinding machine such as is in common use.

Opinions are pretty nearly unanimous as to the bad qualities of a mortar which has been "drowned"—that is, a mortar that has been mixed with or has absorbed too large a quantity of water. Mortar containing too much water lacks compactness, as can be readily understood. The surplus water occupies a certain amount of space, and when the water evaporates, as sooner or later it will, this space will be left and will always remain vacant. The bad quality of "drowned" mortar is not merely owing to its lack of compactness (according to Vicat) but depends also on a chemical cause, namely, that the water which is used in large quantities tends to decompose the silicate of lime and reduce it to the state of a neutral silicate.

On the other hand, in using the water in small quantity it would be absorbed and solidified by the combination, so that decomposition would not take place. Vicat says that "there can be no doubt but that the hydrosilicate of lime, in which the whole mass is chemically united, is of more use than a mere mixture of the neutral hydrosilicate and the pure hydrate of lime, which tends to form when too great a quantity of water is made use of." The foregoing remarks apply equally to rich lime, hydraulic limes and cements.

There is another point bearing upon what might be termed the abuse of water to which reference has to be made, and that is the softening up or diluting of mortar with additional water after it has commenced to

set. This is not so much felt when using rich limes, as the rate of setting is very slow, but with hydraulic limes and cements the results are disastrous.

Two years ago the author made a lengthy series of experiments on Arden lime-mortar, to determine, amongst other matters, the effect of water added to mortar after it had commenced to set, or after the stage of initial set; also as to what effect the quantity of water used in the mixing of the mortar had in the ultimate setting of the mortar. To test the time of setting, the Vicat needle was used (Standards Committee on cement recommend the use of a square instead of a round needle, of certain specified dimensions), the depth of the pat being 40 millimetres. The mortar was made in the proportion of 2 parts of standard sand to 1 part of freshly-ground Arden lime. The lime was got from two different works—that from one work being marked No. 1, while that from the other was marked No. 2. The quantity of water required to mix a mortar of the above proportions to a consistency suitable for use was $4\frac{1}{2}$ gallons of water to 1 cwt. of lime. With No. 1 lime setting commenced within five minutes after being gauged, while with No. 2 setting did not commence till after fifteen minutes had elapsed. Although longer in commencing to set, by the time that fifty minutes had passed No. 2 lime had overtaken No. 1 in the process of setting, and kept the lead until six hours after gauging, when No. 1, which had been slowly setting, got level again. By this time both may be said to have set.

When an additional quantity of water was used for mixing the mortar (1 gallon additional per cwt. of lime) the time of initial setting of No. 1 lime was retarded by ten minutes, while with No. 2 setting did not commence till forty-five minutes after the mortar had been gauged. No. 1 was found to be set six hours after gauging. At that time No. 2 was still a considerable distance from being set, but was found to be set twenty-four hours after gauging.

In the third test the same quantity of water ($5\frac{1}{2}$ gallons to the cwt. of lime) was used as in the second. With both limes the initial stage of setting commenced at twenty minutes after being gauged. A further quantity (equal to 1 gallon to the cwt. of lime) of water was then added and the mortars re-mixed. The setting did not commence until an hour after being re-mixed, and it went on very slowly; so much so that at the end of three days the pats were still unset; to all appearance they were reduced to the level of a mortar made from a fat lime or a feebly hydraulic lime in the ordinary manner. The foregoing results are graphically shown by the accompanying diagram. The loss of strength resulting from the re-mixing of the mortar is correspondingly greater for quick-setting than for slow-setting hydraulic limes and cements, and greater for neat than for

sand mortar, and greater with fine sand than with coarse. The loss increases with the amount of set. Mortar that has been re-mixed shrinks more in setting than mortar freshly used after mixing. This explains the cause of a large number of cracks that are to be seen on cement plasterwork. The only safe rule in using cement or hydraulic lime mortar for practical work is to get the mortar thoroughly mixed, and then not permit any to be used which has taken an initial set, that is, which has lost its plasticity.

Effect of Freezing of Mortar.

The freezing of mortar before it has set may be said to have two effects: (1) The low temperature retards the setting and hardening action, and (2) the expansive force of the freezing water may overcome and destroy the cohesive strength of the mortar.

The action of frost on rich lime-mortar is not serious, since it hardens so slowly. When lime-mortar is used, however, it is not permissible to allow building operations to be carried on during frosty weather. Apart from any effect which the frost may have on the mortar there is great danger to the stability of the wall by the alternative thawing and freezing of the mortar with which the wall has been built. For instance, where a wall has been frozen through, as we term it, when the thaw comes the fresh wind may strike on one side of the wall only, with the result that the mortar on that side of the wall becomes soft, while that on the other side remains hard; thus in many cases causing an unequal settlement of the wall, by which it is put out of the perpendicular.

Effect of Frost on Cement-mortar.

The author made an experiment recently to determine the effect of frost on cement-mortar, but found that before anything definite could be said on the subject a long series of tests would require to be made. The results of the experiment may be summed up briefly:—At 3 degs. of frost, or at 29 degs. Fahr., the physical appearance of the mortar was affected; at lower temperatures ranging from 25 degs. to 14 degs., there was no physical change visible to the eye. The briquette which was at a temperature of 14 degs. when newly gauged presented the same appearance as a briquette which was kept at a temperature of 60 degs. Fahr. The tensile stress required to break the briquettes did not show much variation until the briquettes which had been kept at the temperature of 14 degs. were reached, when their tensile strength was found to be about 10 per cent lower than that of the others.

In the United States of America, where the effect of frost is more serious than in Britain, numerous experimental tests have been made to determine the effect of freezing temperatures on hydraulic limes and cements. Although the conclusions of the various experimenters do not in all points agree, it is the generally accepted belief that the ultimate effect of freezing upon Portland-cement mortar is to produce only surface injury.

The following is a table showing the result of experiments made by T. F. Richardson, an American engineer:—

EFFECT OF FROST UPON TENSILE STRENGTH OF MORTAR: 1 OF CEMENT TO 3 OF SAND.

Briquettes.	No. of briquettes.	Tensile strength in lbs. per sq. in. at				
		7 days.	28 days.	3 months.	6 months.	1 year.
In water in laboratory -	20	268	304	359	370	401
In air in laboratory. -	20	298	352	364	392	517
Outdoors below freezing	80	139	238	344	435	627

This appears to show that frost improves

TIME OF SETTING OF ARDEN LIME-MORTAR.

Mortars 1A and 2A composed of 1 part lime and 2 parts sand mixed with water = $4\frac{1}{2}$ gallons per cwt. of lime.

" 1B and 2B

" 1C and 2C same as 1B and 2B, but 15 per cent. of water added, after settling had commenced.

Portland-cement mortar, though the author is a little dubious about the improvement.

The author has found, however, that when cutting into walls where the skin has been peeled off the mortar by frost, the mortar in the wall was quite sound. He once had experience of a Granolithic pavement where the skin was pulled off the surface of a few of the sections by a severe frost. It was intended to relay these sections in the following Spring, but on examination the concrete was found to be quite sound, and at the present time, after the lapse of nine years, the sections that were affected by the frost cannot be distinguished from the others.

It may, however, be stated as a general rule that, if possible, building operations should be suspended during frosty weather. In cases of emergency, or where the buildings are urgently required, with proper precautions cement-mortar may be used with very little (if any) bad effects.

These precautions are admirably put as follows by an American engineer, a Mr. Baker, in his treatise on "Building Construction":—

- (1) Use a quick-setting cement.
- (2) Make the mortar richer than for ordinary temperatures.
- (3) Use the minimum quantity of water.
- (4) Prevent freezing as long as possible.

The first three requirements of Mr. Baker's are easily met, but the fourth is more difficult. To cover up the wall that is being built will prevent freezing of the mortar in a wall when the temperature is below freezing-point during the night. The author found by experiment that if four hours passed from the time the mortar was mixed till it was attacked by the frost there was no bad effect. It is when the temperature is below freezing-point during the daytime that greater precautions have to be taken. Fires should be kept burning around the board upon which the mortar is prepared. The stones or bricks with which the wall is built should be dry and free from frost.

Various American writers advocate the use of salt among the water with which the mortar is mixed. Baker gives the following recipe:—Add to the water used for mixing the mortar 1 per cent. of salt for each Fahr. degree below freezing. Messrs. Taylor and Thomson, in their book on "Concrete, Plain and Reinforced," another American publication, writing of the effect of salt on mortar, say: "Since the temperature of the water cannot be determined in advance, an arbitrary quantity is as suitable as a variable one. In the New York Subway work in 1903 9 per cent. of salt to the weight of water was adopted; on the Wachusett Dam, during the winter of 1902, 2 per cent. of salt to the weight of water. This makes about 1 cwt. of salt to every 120 gallons of water used at the subway and 1 lb. of salt to every 5 gallons of water at the dam."

In Mr. Richardson's experiments salt, added in the proportion of from 2 per cent. to 4 per cent. of the weight of water, gave slightly higher tensile strength than the unsalted mortar at all seasons of the year.

The following table is given by a Mr. Charles S. Cowen, another American, as the result of his experiments with salt added to the extent of 10 per cent. of the weight of water used:—

TENSILE STRENGTH OF 1 TO 3 MORTARS MADE WITH FRESH AND SALTED WATER.

	1 week.	1 month.	3 months.	6 months.	9 months.	12 months.
Fresh water used	112	183	268	335	351	458
Salt water used	68	131	215	266	301	413

The above table scarcely bears out Mr. Richardson's statement that the mortar is

improved by the addition of salt to the water.

The author is of opinion that a small quantity of salt may be added without much harm being done, and that it will keep the water from freezing until the cement has become fairly well set; but there are so many risks in connection with the use of mortar during frosty weather, and so many precautions to be taken, that unless there are very urgent reasons for the work being proceeded with all building operations should be suspended during frosty weather.

MANCHESTER SCHEMES.

(By our Manchester Correspondent.)

TWO schemes of more than ordinary importance have just been mooted in Manchester—the transfer of the Royal Exchange to the old infirmary site in Piccadilly and the provision of a new General Post Office.

Since the decision of the trustees to build the new infirmary outside the centre of the town the future of the old site has been the subject of constant discussion, but the idea which has most appealed to the imagination has been the provision of a large building in which should be housed the art collection and the fine reference library. This would still allow for an open space where it is particularly needed, and for such an extension of the tram lines as would make a convenient tram centre.

Both the art gallery and the reference library—the latter the old town hall in King Street—are congested, and immediate extension or removal is imperative. The art gallery in Mosley Street could be extended by taking in the plot of ground surrounded by Princess Street, George Street and Nicholas Street, but this would mean the purchase and demolition of the Athenæum, an historic and almost unique institution. That, however, would not be an insuperable difficulty, for the finances of the institution are not in a most healthy state and the members might welcome the opportunity of a profitable sale. The ground available for the extension of the reference library is small, and as the building is not particularly well adapted for its present purpose the wisdom of any further expenditure upon it is doubtful.

Now it is announced that there has been a conference between the directors of the Royal Exchange and the Corporation with a view to the erection of a new exchange upon the old infirmary site. In common with the other institutions, the fine building erected in the 'seventies by Messrs. Mills & Murgatroyd is too small for present-day needs. Manchester, in fact, is outgrowing all its clothes. The large room contains over 4,400 sq. yds. of floor space, yet this immense area is insufficient for the accommodation of almost 9,000 members, and on market-days the room is insufferably crowded. An extension across Bank Street has been frequently suggested, but presents obvious difficulties, and the building does not adapt itself to extension in any direction. Yet the removal of such an institution the whole length of Market Street seems still more difficult. At present all the Exchanges—stock, coal, produce and cotton—are within a stone's throw of each other, are in close proximity to the Exchange and Victoria Stations, and are surrounded by a mass of offices and other accessories which, as it were, anchor the great Royal Exchange to its present site. The removal to Piccadilly would change the centre of gravity of the whole city.

The second large scheme is the provision of a new head post-office, for which land has been purchased in Newton Street, just off Piccadilly. The present post-office in Brown Street was built in the 'eighties and cost, exclusive of the site, £100,000. It covers an

area of 4,700 sq. yds. Notwithstanding the subsequent provision of a separate parcel-post depôt and of various outside district sorting offices, the great building is unequal to present needs. In Newton Street a building will be erected which will meet the requirements of the greatest postal centre in the kingdom outside London, and the present office will be retained as a subsidiary branch.

In another quarter of the town a change is imminent. For some time past it has been understood that St. Peter's Church was doomed, and it seems now probable that the site will be acquired by the Corporation and converted into an open space. The doubtful point is whether Manchester will stand the expense of so costly an improvement. The recent emphatic negation of the Corporation Bill proves the existence of a severely economical spirit.

Apart from these large schemes, one hears of few projected buildings of importance except schools. Of these the Lancashire Education Committee is prodigal, and almost every week sees an advertisement for tenders for a new school in some part of Lancashire. Mr. Henry Littler's output in this direction will soon break all records, if it has not already done so. The Salford Committee has just decided to spend £18,600 in the provision of a new school in Pendleton to replace two existing and inadequate elementary schools. The plans of Mr. J. H. Woodhouse, of Manchester, have been accepted.

A Garden City or model village is projected at Didsbury—one of the most pleasant of the Manchester suburbs—and eighteen acres of land are said to have been acquired for the purpose.

Notes and News.

A Crematorium for Cardiff is suggested.

New Grammar School for Newark.—New school buildings for 150 boys and a master's house, including boarding accommodation for thirty boys, are proposed to be built at Newark at a cost of £10,000.

Proposed new Schools at Eccles.—The proposal of Eccles Town Council to rebuild the Clarendon Road Council Schools for 1,100 children was the subject of a Board of Education enquiry last week.

"Canadian Cities" formed the subject of a lecture at the Birmingham Builders' Exchange last week by Mr. Peter Ball, resident agent at Birmingham for the Commercial Agency of the Canadian Government.

New Buildings at Whitgift Grammar School, Croydon, were opened last week. They include six large classrooms, a drawing school, woodwork and metalwork shop, and mechanical laboratory, with chemical and physics laboratories on the first floor. The new buildings have cost £17,500.

A Russian Restaurant has been provided at Romano's, in the Strand. Mr. Frank Stuart Murray designed it. The work has been carried out by Mr. W. E. Thornton-Smith in pine-wood brought from North Europe forests, and has doors discovered in an old château in Denmark.

At the Second International Congress on School Hygiene to be held in London next year there will be a section devoted to "The School Building and its Equipment" and another to "Special Schools, including those for the feeble-minded, blind, deaf, dumb, crippled, invalid and exceptional children." An exhibition of school building and furnishing appliances will also be organized by the Royal Sanitary Institute in connection with the Congress. The offices are at the Royal Sanitary Institute's premises in Margaret Street, W.

The Society of Architects visited the new Central Criminal Court in Old Bailey on Saturday last, about 150 being present.

Mr. Albert E. Bullock, A.R.I.B.A., of Chiswick, now has offices at 5, John Street, Bedford Row, W.C.

A new Central Stores is proposed to be built by the Metropolitan Asylums Board at a cost of £18,000.

Mr. James Miller, of Glasgow, who is a member of the Glasgow Institute of Architects, and an F.R.I.B.A., is the new Architect Associate of the Royal Scottish Academy. He was the architect for the main buildings of the 1901 Glasgow Exhibition.

The Twenty-Third Annual Congress of the Royal Sanitary Institute will be held at Bristol from July 9th to 14th under the presidency of Sir Edward Fry. Mr. Edwin T. Hall will preside over the Engineering and Architecture section.

Extras on the Glasgow Technical College.—The extra cost over the accepted tenders for the Glasgow and West of Scotland Technical College is £10,303, the total value of work done being £151,318. The extra cost is largely for foundations, there having been difficulties with rock and running sand.

Five Guineas an Hour.—At last week's meeting of the London County Council members of the Tribunal of Appeal under the London Building Act made a request for increased fees. They are now paid three guineas for the first hour and two guineas an hour for subsequent hours. Their request was for five guineas for the first hour and three guineas for any subsequent hour, with a minimum of twelve guineas for each appeal when an appointment had been fixed, whether the case was argued before the Tribunal or not. The Building Act Committee thought the present rate of payment was adequate, and the Council agreed.

The Strand Alignment.—At the meeting convened at the Royal Academy of Arts last week a resolution was passed to the effect that "the memorial of the Further Strand Improvement Committee, the Royal Academy of Arts and other corporate bodies makes a clear case against the plan adopted for the building land between Aldwych and the Strand, and that the London County Council be requested to receive a deputation charged with the duty of presenting the memorial." Sir Aston Webb, R.A., spoke on behalf of the Royal Institute of British Architects. The Institute, he said, felt very strongly that a great mistake would be committed if some alteration were not made in the alignment proposed.—The architect in charge of the adopted scheme for the Strand site is Mr. W. Gilbee Scott, F.R.I.B.A.

Leeds and Yorkshire Architectural Society.—At last Thursday's meeting of this Society Mr. W. H. White, F.R.I.B.A., read a paper on "Modern Town House Architecture." Taking as example an ordinary good-class town house with a frontage of from 22ft. to 30ft. and (according to position) of a rental value from £300 to £500 per annum, Mr. White said the accommodation required would be dining-room, library and morning-room on the ground floor, drawing-rooms and boudoir on the first floor, and eight or ten bed and dressing rooms, two or three bathrooms, a well-arranged basement with all the necessary offices, service lifts, a good hall and staircase, and, if possible, a back staircase, and, to be quite up to date, an electric passenger lift. The following officers were elected for the ensuing session:—President, Mr. H. S. Chorley; vice-presidents, Messrs. P. Robinson and S. D. Kitson; council, Messrs. W. G. Smithson, F. E. P. Edwards, C. B. Howdill, H. A. Chapman, A. R. Hill and G. E. Reason.

Professor Moira's Mural Paintings at the Central Criminal Court.—Prof. Gerald Moira has now completed two of his mural paintings for the lunettes over the entrances to the courts in the Central Criminal Court, Old Bailey. They are not yet in position, however. The lunettes represent "Justice receiving the Homage of the Empire" and "Mosaic Law," the latter forming one of a series which will include English, Greek and Roman Law.

Irish Building Stones were dealt with by Professor Cole, F.G.S., at last week's meeting of the Architectural Association of Ireland at Dublin (Mr. Harry Allberry, A.R.I.B.A., president, in the chair). He drew attention to the splendid beds of limestone which exist in many places in Ireland, more especially in County Roscommon, and referred in terms of high appreciation to the Mount Charles sandstone, the Liscannor stone, the Ballyknocken granite, Newry granite, Galway granite, and other varieties, making clearly evident that there exists in Ireland abundant provision of good building stone.

R.I.B.A. Prizes and Studentships, 1907.—The following are the subjects set for this year's prizes and studentships of the Royal Institute of British Architects:—Essay Medal and 25 guineas: "The Influence of the Use of Iron and Steel on Modern Architectural Design." Soane: "A Large City Hotel facing a Public Square." Tite: "A Loggia for Sculpture to screen the blank end of a building 150ft. long." Grissell: "A Grandstand for a Racecourse, of timber, to accommodate 1,000 people in the boxes and 3,000 on the roof." Henry Saxon Snell Prize: "A Critical Report on Hospitals for the Treatment of Consumption." Other prizes as before. A pamphlet giving full particulars of each can be obtained from the offices of the Institute, 9, Conduit Street, W., price 3d.

Trade and Craft.

Checking Receipts of Public Conveniences.

There are many serious objections to the system of coin-collecting locks in public conveniences, so generally adopted, the chief objection being the ease with which a dishonest attendant can pilfer the takings. To overcome this failing a combined registering lock and indicating latch has been designed with a very simple and effective form of registering apparatus. The accompanying illustration shows it. The arrangement of lock

and indicator with the counting mechanism is simplicity itself, only one spring being used in the combination. The lock measures 6ins. by 4ins. by 1in. and is fitted on the outside of the door. The system is one that should commend itself to all persons having the control of public conveniences. It is already in use by the Corporation of London, and numerous other metropolitan boroughs are now adopting it. The apparatus is being put on the market by the New Century

Co., of 235, High Holborn, W.C., and, considering its utility, is being sold at a very low figure.

Law Cases.

Joinery Works and Fire protection: Heavy Fine.—At the North London Police Court last week the Steam Joinery Works, Elthorne Road, Holloway, were summoned by the London County Council for neglecting to comply with an order to provide means of escape in case of fire at their premises. Mr. Chilvers, who prosecuted for the London County Council, said the factory consisted of ground floor and three floors over. There were ninety-two men employed there, sixty of whom worked on the upper floors. There were no proper staircases to those upper floors—only step-ladders. The County Council ordered the erection of an iron staircase connected with each floor; but, though this order was delivered last May, nothing whatever had been done.—The manager of the company said it was an expensive order, costing nearly £300; and there was a probability of the property being sold. He asked for an adjournment of the case until next August.—The magistrate refused to allow this. The defendant, he said, had too long delayed a very necessary work, and would now pay a fine of £36 and £3 3s. costs.

Partnerships.

Dissolutions of Partnerships.

[The date when the partnership was dissolved is given in parenthesis where known.]

F. W. COOPER & DAY (FREDERIC WILLIAM COOPER and JOHN FREDERIC DAY), architects, surveyors, auctioneers and estate agents, Walsall and Wednesbury. (Jan. 15.)

JOHN JACKSON & SONS (THOMAS JACKSON and ROBERT JACKSON), joiners, builders and contractors, Whitefield. (Jan. 26.) Debts by R. Jackson, who continues.

GILBERT SMITH & MARCUS TYPE (FRANCIS GILBERT SMITH and OSWALD MARCUS TYPE), architects and surveyors, Birmingham. (Dec. 25.)

BOWSER & PETTY (ROBERT BOWSER and RICHARD MORTIMER PETTY), builders and contractors, 70, Williamson Street, Hull. (Feb. 3.) Debts by R. M. Petty.

PIERCY & NOBLE (MACKLEY PIERCY, HENRY SAMUEL PIERCY and JOSEPH HENRY NOBLE), builders, Haxby, York. (Mar. 1.)

HEDLEY & CLAYTON-GREENE (HUGH TAYLOR DEMICUS HEDLEY and CLARE ARNOLD CLAYTON-GREENE), architects and surveyors, Sunderland. (Feb. 17.) Debts by H. T. D. Hedley, who continues as Hugh Hedley.

DAVIS, KEEBLE & KEEBLE (GEORGE KEEBLE, JOSIAH YOUNG KEEBLE and ARTHUR CHARLES DAVIS), contractors for the Norman Portland Cement Co., Ltd., Works, Cambridge. (Feb. 1.)

E. FEARLEY & SONS (EDWIN FEARLEY and JOHN EDWIN FEARLEY), joiners and builders, Trafalgar Street, Bradford. (Jan. 26.) Debts by John Kitson, Swan Arcade, Bradford.

HARTLEY & ASHBY (AGNESE EMMA HARTLEY and HERBERT WILLIAM ASHBY), painters, decorators and paperhangers, 28, Blake Street, York. (Dec. 31.) Debts by A. E. Hartley, who continues.

BURGESS & LOMAX, builders, Manchester. The partnerships between WILLIAM BURGESS and SAMUEL LOMAX and WILLIAM BURGESS, SAMUEL LOMAX and JAMES HOPKINSON LOMAX dissolved Mar. 2.

TAIT & HARVEY (CHARLES JAMES TAIT and JACOB EMLYN HARVEY), architects, Bampfylde House, Exeter. (Dec. 31, 1903.) Debts by J. E. Harvey, who continues. C. J. Tait will practice at 57, High Street, Exeter.

BATES, DEWSBERRY & CO. (GEORGE FREDERICK BATES and GEORGE HENRY DEWSBERRY, tile manufacturers and decorators, Mayer Street Tile Works, Hanley. (Feb. 19.) Debts by G. F. Bates, who continues at Victoria Art Tile Works, Adventure Place, Hanley.

BRADSHAW & SON (EDWIN BRADSHAW and EDWIN BRADSHAW, jun.), asphalt manufacturers, artificial paving manufacturers and builders' machinists, Fawcett Road, Southsea and Northam, Southampton. (Feb. 1.) Debts by E. Bradshaw, jun.

DUESBURY BROTHERS & BILL (FREDERICK WILLIAM AMBROSE DUESBURY, ARTHUR EDWARD DUESBURY, ALFRED ERNEST DUESBURY and CLEMENT HENRY BILL), varnish manufacturers, Faraday Works, Monmouth Green, Wolverhampton. (Mar. 9, as regards F. W. A. Duesbury.) Debts by the continuing partners.

FOSTER & SANDERSON (HUGH FOSTER and GEORGE SANDERSON), plumbers, glaziers and gasfitters, 15, Garne Street, Middlesbrough, and 7, Smeaton Street, North Ormesby, near Middlesbrough. (Mar. 3.) Debts by H. Foster, who continues at 15, Garne Street, Middlesbrough in his own name.

SMITHS, GORE, NORTON & CO. (SPENCER WILLIAM GORE, THOMAS HERBERT NORTON, JOSEPH HENRY SHERWIN, and JOSEPH HENRY SABIN), land agents and surveyors, 10, Little College Street, Westminster, S.W. and Darlington and Chester. (Jan. 31, as concerns S. W. Gore.) Debts by the remaining partners.

HALL'S SANITARY WASHABLE DISTEMPER

The Refinement of Good Taste in Wall Decoration

is shewn in the choice of Hall's Sanitary Washable Distemper. This is a wall covering that is at once artistic, practical, and economical.

Its practical advantages are simplicity, durability, and cheapness. Only water is required to be added to make Hall's Distemper ready for use. It is unaffected by light, heat, or damp, does not crack or peel off, and is washable.

It is made in 73 colours, including rich dark as well as light shades; in actual cost it is cheaper than wall paper or flatted paint, and being applied with a whitewash brush represents a further great saving in labour.

"Sisco" White Japan is the correct material for painting Doors, Picture Rails, and all woodwork of rooms decorated with Hall's Distemper. "Sisco" Japan is a pure white decorator's enamel, which dries with a hard, smooth, lustrous surface. It lasts for many years with beauty unimpaired.

"Modern Development in House Decoration," a beautiful booklet with coloured views of Drawing, Dining, Bedroom, and Library, sent post free on application (with samples and shade-card of Hall's Distemper if specially requested), from the sole manufacturers,

SISSONS BROTHERS & Co., Ltd.,

Electrical Notes.

A Plea for the Electrical Draughtsman.

In the architectural profession the cry of the draughtsman has long been familiar, and, in the very nature of things, is likely to continue. More often than not he is a considerable factor in the design of the work in hand, being very much more than a mere inker-in of pencil drawings: indeed, it is often left to him to work out the difficult details of the problem, and so, in actuality, he becomes the real author of the design, though by reason of office conditions his employer claims the credit for the work. This same tale, so familiar among architects, has a similar application in other professions—the electrical, to wit: thus we find our contemporary the “Electrical Review” dealing with the position of the engineering draughtsman. This, it appears, instead of being one of the most interesting and desirable, has become a position to be avoided, as it is badly paid and is looked down on with supreme contempt by every man who has been fortunate enough to obtain other employment on the staff of an engineering works, and who for that reason fancies himself a vastly superior person. But, asks our contemporary, do engineering employers as a body realize what an important element the draughtsman is in the machinery of the works? Do they recognize the fact that few of their employees have more power to waste or save their money, and to injure or enhance their reputations? “This is most serious, for the reason that their influence for good or evil is more difficult to detect than, say, of the estimator or works manager. This influence is, of course, greater in the case of men who are originating designs or are engaged on work in which the firm has little experience.” But in the electrical profession,

as in the architectural, the credit for anything the draughtsman may do is taken by others, frequently his inferiors in knowledge and experience, who sometimes overrule his better judgment. “All this,” says our contemporary, “tends to crush any enthusiasm the man may have, and generally he becomes resigned to jog along in a groove, with little or no interest in his work beyond that necessary to keep his job. . . . Let employers treat ‘designers’ as something more than mere draughting machines, give credit when due, and make it clear that they have a chance of improving their positions. Then engineering draughtsmen would feel a pride in their work, and a better, and more competent, class of men would be obtainable.”

Liverpool Electrification.

An item of railway work of interest is about to be carried out near Liverpool by the Lancashire and Yorkshire Railway Co. This is the electrification of a short length of line between Marsh Lane and Seaforth, in connection with the electrified line between Liverpool and Southport. It is expected that as a completing operation to the project named, a physical connection will be made between the Liverpool Overhead Railway and Marsh Lane station, similar to that which was recently made between the Overhead Railway and the Lancashire and Yorkshire Railway, at Seaforth. This last-named connection involved some interesting and costly work, from the constructional point of view.

The Manufacture of Carbons.

Though carbons are so extensively in use and have become one of the staples of the electric lighting engineer, the method of their manufacture is not so generally known. We may take, as a good example, the works of the General Electric Co. at Witton, near Birmingham, where nearly 300 hands are

employed. The carbons here are made up of a mixture of gas-retort carbon, soot and tar, all three being thoroughly well ground and mixed together under heat, and then passed into cylinders and extruded through a die in the form of rod, which is cut off in 3ft. lengths. Bundles of the rods are then made up for firing in the furnace, where they are packed round with carbon dust, to exclude air. A very high temperature is maintained, and the carbons are completely baked, after which they are gradually cooled and then cut to the required lengths (each being tested for straightness by rolling down an incline), and finally ground flat at one end and pointed at the other. In addition to the ordinary carbon there is the cored variety, which is moulded over a needle centre and the coring mixture pumped in after the baking process; then oven-dried.

Extensions to Scotland Yard are nearing completion, from designs by Mr. Norman Shaw. The new block faces the original one, and over Derby Street is a fine granite arch connecting the two portions. The span is 38ft., with an extreme height of 38ft. also. The face is pierced on either side by openings 6ft. wide for passengers.

The new roof of Charing Cross Station will be of the ridge and furrow type, supported by two rows of steel columns 35ft. high. The highest point of the trusses will be 45ft., as compared with 85ft. of the original structure. The roof is being erected from a huge staging weighing 450 tons, in the construction of which 25,000 cub. ft. of timber have been used. The old station contained originally fourteen bays, each 35ft. wide. Two of these fell down, and four have since been removed, leaving half the work yet to be done. The contractors are Messrs. Handyside & Co., of Derby.

THE BUILDERS' JOURNAL AND ARCHITECTURAL RECORD.

March 28th, 1906.

CONTRACTORS' SUPPLEMENT (MONTHLY).

SOME NOTES ON ESTIMATING.

By J. H. Pinnock.

THE profit on all work generally accepted in the trade is 10 per cent., but in actual practice in competition work it is much lower. A builder with a large turnover and monthly draws on a contract at the rate of 80 per cent. or 90 per cent. on the amount of work done will be quite satisfied if he gets a profit of $2\frac{1}{2}$ per cent. on his turnover, and when this is considered in relation to the amount of capital necessary for the turnover it will show a very substantial dividend. Of course in a good many cases the 10 per cent. profit included in estimates is expected to provide for establishment charges, accidents, mistakes made by foremen and other unforeseen contingencies; but in the case of large provisional amounts included in bills of quantities the risk is a purely financial one, and some builders are quite content to price them at the sum mentioned in the quantities, except in cases where it is stipulated that the builder shall provide cement, attendance, special scaffolding or other items requiring money to be paid by the builder.

Constants.

There is a general impression that the requirements of a good estimator are the possession of a list of constants and some recognized price book, but this view is erroneous, as constants are not to be depended upon in competition work. It is generally understood that a large portion of the work under contract is done under the piecework system, or, to give it a more polite term, "task work," and when an estimator knows that an estimate is to be prepared at cut figures he makes himself acquainted with the lowest prices obtainable for that particular work, the quantity of which will tell him that it will be the dominant factor in obtaining the work. In comparing the prices so obtained it is to be noticed that the variation according to the locality or demand for work is very great. Take, for instance, the question of dressed stonework. If the estimator knows of a country quarry that wants work he very often obtains a ridiculous price for the stone dressed and delivered without deviating from the general conditions of the contract.

The London Builder

at the present time is nothing more than a contractor or financial agent, and within bounds of the clauses in his contract prepares the best part of his work in the workshops. At the present time the tendency is to locate these in the country, and the architect or his client does not know whether the work is being prepared in the builder's London shops or let out task work to a specialist in the country.

In preparing estimates at the present time, when competition is very keen, the estimator must see that he covers himself (1) by obtaining prices for his work from specialists or merchants for materials in every branch where this is possible; (2) making the stipulation that the quotation shall be open for a month, and that the goods and work supplied shall be to the satisfaction of the architect and contractor, and (3) that when the work

is obtained an agreement shall be entered into with them as to the method of payment (there is now a standard form of agreement for sub-contractors issued by the Institute of Builders). Of course, in obtaining these special prices it will be noted that very often they vary much from the constants quoted in the standard works, and that is not always on account of locality, but chiefly a question of supply and demand. Mr. Banister Fletcher in his book on "Quantities" gives a list of constants, but states, "I am aware they are very far from perfect." Constants and price books are useful to estimators in some isolated cases that are rarely met with in the building trade, but the requirements of a good estimator are actual work at bench and on jobs, technical training, quick reading of drawings (rough or otherwise), knowledge of builder's prime cost, and experience, which last comprises testing the prime cost of works against their estimated cost.

In some builders' offices the cost of work is purposely kept back from the estimator, or purposely inflated or varied, and this I think is a very wrong method of conducting a builder's business. The estimator should be kept constantly in touch with the cost of the work, and if there is a loss on the estimate, or a very large profit on any particular item, he should be acquainted with the fact so that he can keep himself up to date in the prices. The management of a builder's business is likely to alter at any time, and with the introduction of new machinery or methods the cost of production might be lowered. On the other hand, it is possible that increase of wages and other contingencies may happen to raise the cost of production. Unless these facts are within the knowledge of the estimator he will get jobs at ruinous prices, or waste his time in pricing work at too high a figure.

In pricing quantities prepared by a surveyor it is best to ignore those items of labour only which are set out very fully, and price the quantities as they appear with the materials, excepting where the labour is very unusual or expensive. In advocating this course I do so because so many estimates have to be prepared from drawings and specifications only, and in most builders' offices there is not the organization or time to amplify the bill of quantities as a quantity surveyor would do when paid for all his clerical work. After taking out quantities from drawings and specifications I should advise the same prices to be used as when pricing from a professional set of quantities. By so doing an estimator can adopt a method of pricing suitable to all classes of estimates he has to deal with.

One very special point I would impress on estimators is always to view the drawings of a building and note any particular fads of the architect which are set out in the specification or conditions. This does not take long if a few judicious questions are put. The site should also be viewed and the distance of the nearest goods station obtained, and it should also be noted if the goods station is on the main line of the railway; if not, the branch railway line should be ascertained, as the charges for running over the lines of two railway companies very often so increase the cost of delivery that it is better to pay extra cartage. In viewing suburban sites, or those difficult of access, it is very convenient to traverse the neighbourhood on a cycle provided with a cyclometer, as, not only can distances be measured, but carmen and merchants in the locality can be brought into touch.

The new works for the American Radiator Co. at Hull are to be erected in three months. The contract is in the hands of Messrs. H. Arnold & Sons, of Doncaster, who commenced their task nearly a fortnight ago. The foundations are nearly completed, and the steelwork will follow. The requisite temporary roads to the site have been made, and the North Eastern Railway Company have erected a siding some distance away, from which railway lines have been laid for the purpose of unloading material.

STANCHION AND GIRDER CONNECTIONS AT GLOUCESTER HOUSE FLATS PARK LANE, PICCADILLY, LONDON.

GLOUCESTER HOUSE FLATS.

IN this issue we publish several photographs showing the erection of the Gloucester House Flats at the corner of Park Lane and Piccadilly, London, of which Messrs. Colcutt & Hamp are the architects. This building is a big example of steel-frame construction, as about 1,400 tons of steel-work are to be used. The steelwork is being made and erected by Messrs. Drew-Bear, Perks & Co., Ltd., of the Battersea Steel-works, Wellington Road, S.W., who are performing their part of the work with the utmost dispatch, as will be seen by the two photographs on p. 19, showing the progress that has been made; it should be mentioned, however, that considerable delay has been caused by ancient lights troubles, which have prevented the drawings getting much beyond the second floor. The first stanchion arrived on January 11th, and was put in place, together with four others, on January 20th. The foundation plan on p. 20 shows the concrete and steel grillages which are being used, while the photograph below shows the manner in which the stanchions are braced along the Park Lane front. The construction of the steelwork is somewhat unusual. A detail of connections on the preceding page show its elaborate nature, and the peculiar way in which the plates have been riveted on the stanchions, projecting one beyond the other, completed with a final small angle iron. This is unnecessarily elaborate, and it greatly increases the cost. Messrs. Drew-Bear, Perks & Co., however, are not responsible for the design.

No contractor has been engaged up to the present for the general building work, which has been done under the clerk of works and the architect. The work was commenced in July last, at which time the previous building on the site had been demolished. When the excavation was carried out it was discovered that the foundation of the previous building on the Piccadilly front consisted of a large oak beam, which was still sound. The adjoining party-wall had no foundations at all, and not only had this to be underpinned, but some of the interior walls also. Eleven wells and cess-pits were found on the site. We shall illustrate the building further as it advances.

A JOINER'S SHOP.

Its Organization and Management.

By W. YOUNG.

[The author of this paper is by trade a joiner and the son of a joiner, and has occupied positions as foreman of joiners' shops for over thirty years, so that his opinions are the result of mature experience.—Ed. B. J.]

THE joiner's shop I have in mind is one of ample size for the accommodation of from forty to fifty single benches, well-lighted naturally and artificially, well-ventilated, with lavatory accommodation carefully arranged, easy access with approaches of sufficient width to allow of ready incoming and outgoing of employees, trap doors in floor for the purposes of lowering

or raising material, &c., to or from the mill floor, and sliding doors of sufficiently large dimensions, provided with appliances for lowering finished work from shop on to vans without damage and expeditiously. The shop would also be fitted with bins for containing a good supply of wedges of all sizes, cross-tongues, angle blocks, nails, brads, &c., thereby obviating any unnecessary delay, which would add to cost of work besides ruffling the tempers of the employees concerned.

Tools, such as joiners' cramps of various lengths, with a complement of lengthening bars, iron cramps for jointing, and a good supply of strong roughly-finished hand-screws, should be in evidence, with proper tacks and stands for stowage immediately they are finished with.

A Good Supply of Glue.

It is absolutely essential that a good supply of well-cooked glue is at all times readily obtainable, and clean hot water also. I have found that the best and cleanest method for this purpose is to have one or two tanks perforated at the top to suit sizes of pots with a draw-off tap for water and an overflow pipe. Pots should be of copper. Tanks can be heated by exhaust steam if there is sufficient, but I have found it necessary to have live steam, and that properly regulated by a shop labourer.

The shop should at all times be kept at an even temperature. Then, with material properly seasoned and work standing after being knocked together prior to wedging up, there will not be much fear of complaints from shrinkages—a very wise requirement found in most specifications, but not so generally observed or carried out as it deserves to be.

Doubtless many of the details mentioned may be considered trivial. But Michael Angelo once said that trifles make perfection, and perfection in joiner's work is no trifle.

In addition to the benches provided for joiners (which, by the way, should be from 11ft. to 12ft. long and about 27ins. wide, and if space at command will allow about 26ins. between, and never less than 22ins.) one or two long benches should be provided for setters-out of rods. If possible these should be at some distance from the joiners, yet within easy reach for information which may be required from the setters-out.

The shop should preferably be on the first floor and all the machinery on the ground floor. No material except for works in hand should be allowed to accumulate on the shop floor, and any reference to the mill for materials or work should be made through and supplied by a shop labourer. No communication should be made by joiner to machinists except through the labourers, setters-out or foreman.

The Foreman.

Next to the shop on the first floor, the machinery on the ground floor, and other requisites mentioned, is the work itself. Of course fluctuations cannot be avoided, but I have always found the greatest incentive and stimulus to a rapid output is to let employees see that there is another job awaiting their attention immediately on completion of the job in hand, and the foreman will, if he is a good and tactful manager, be ever on the alert, making sure no loss through delay shall occur from any laxity on his part. The foreman in charge is the man who winds up, and so long as the supply of work continues he keeps wound up. He occupies an onerous and responsible position, and generally very many of his most trying and anxious hours are those spent by employees under him in rest or recreation; oft times his most difficult jobs have been finished in his mind after his day's duties have been fulfilled. He must be a man thoroughly qualified in all theoretical, technical and practical questions appertaining to

the trade (not joinery only, but the whole of the building trade), versed in the values and qualities of material, sound in his judgment, quick to discover and explain to those under his control the readiest and most economical method of carrying out any and every detail of work in hand (consistent with drawings and specification), and always prepared to reply with decision to any queries relating to the work, for in my opinion there is nothing so tends to belittle a foreman in the estimation of men under him as hesitancy on matters of detail or construction. Nothing will so securely establish him as to let those under him see by his answers that he knows what he is talking about.

The foreman must have not only the joiner's shop under his control but also the management of the mill as regards his work, his instructions of course being given to the foreman in charge of machinery and machinists. If he is handicapped by any adverse influences he is bound to fail.

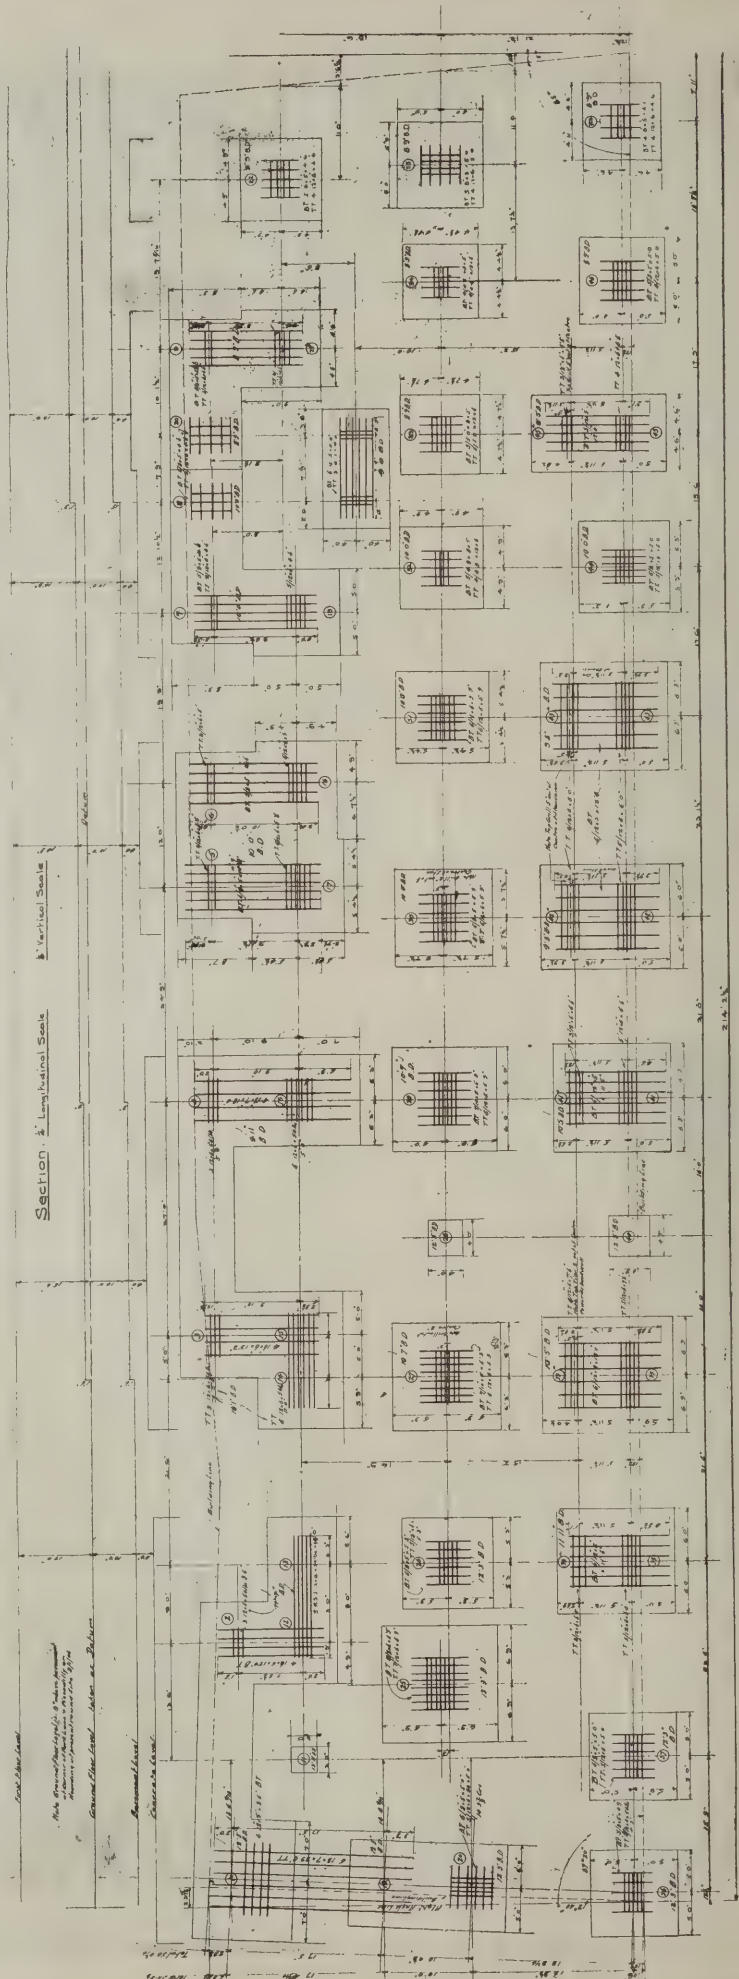

Setting-out.

With all manifold duties pertaining to the position occupied by the foreman, it is evident he could not devote the time and attention required in setting-out working rods, but every rod set out should be under his direction and supervision. Assistance he must have, and no one is more fitted than himself to select his assistant from those under him. Were it not for our technical institutes I fear there would be just grounds for the statement we at times hear about the deterioration of British workmen. Unless advantage is taken of the opportunities afforded by these institutions, it is almost impossible to-day for a young man to acquire such a thorough knowledge of carpentry and joinery as in the days of our ancestors. This is through no fault of his own, but owing to the sub-division of labour that came in with the introduction of machinery. In the writer's apprenticeship days one had to begin at the beginning, and a great drudge it was at times, but one was allowed to carry out the job to the end. First it was the cross-cut saw, then the half rip, next the jack and trying planes, morticing, tenoning and moulding—all by hand: but in the end the pleasure was derived in being able to say, "That is my piece of work."

I have an idea that many of our present-day apprentices would be inclined ere the end of their first year to regret the selection of the trade were they called upon to do as in days prior to machinery. However, setters-out, and proficient ones, are to be found, and the foreman whom we have selected will readily select the proper men for the position, and with a little extra remuneration over the standard rate of pay there will be no question about the rods being set out.

As regards Rods,

the writer's preference is for boards about 3/4 in. thick and gins. or 11 ins. wide, thinly whitened so as to show lines clearer; they are not then so liable to become defaced. They should be clear, and as far as possible set out so as to obviate any necessity for questions after once being explained to the individual entrusted with the execution of the work. The rod having been set out from the foreman's instructions, or the architect's drawings and specification, it should be numbered. The number should be clearly shown, a coloured pencil being used. Any information necessary should be added in writing, such as quantity, quality, whether for staining or painting, floors, and destination of work when completed. Should the job be intricate in any way, an elevation to scale should also be given. The rods must now be measured up by the setter-out for quantities, &c., of material required. The best system I know of for keeping a record of the same for office-booking, foreman's reference and cutter-off's use is a book with three leaves for each job, two of the leaves

Note.—All levels given are to top of top-tier of grills. Grills and stanchions to be steel to steel. — A cement bed 1 in. thick to be under lower grills. All joists British standard weights rain. by 6 in. by 54 lbs. GLOUCESTER HOUSE FLATS, CORNER OF PARK LANE AND PICCADILLY: FOUNDATION AND GRILLAGE PLAN.

being perforated for detaching—one for office, one for cutter-off, and the remaining one in the book kept by the setter-out. Material must be taken off to avoid waste; lengths, widths and thicknesses for sawyer; and in columns provided the width and thickness for use of planer. After being passed by the foreman, rods should be marked with numbers on the edges, and stood with the marked edge outwards for use when wanted by the setter-out of the work in the mill. The material, board or sheet, is placed for cutting off in the hands of a specially appointed man called

"The Chalkey."

and all stuff as cut off must have the corresponding number to the rod and board distinctly marked on it. This "chalkey" should be a joiner, as it is essential that he should be able to read a rod and understand the relative position of each piece of stuff cut off, as well as understand the nature and quality of stuff, and be able to discriminate between the values of material he has at his command. It is a most grievous and costly experiment to put a labourer to this work. The little extra pay given to the mechanic is amply repaid.

The Shop Labourer

is another very valuable—very essential—adjunct to a joiner's shop. My experience has been that with a shop full of men I could more readily dispense with two average joiners than be without the services of the shop labourer. He is the one that must see that everything is in its place, every receptacle filled with its different requisites (such as wedges, tongues, blocks, &c.), tools in their allotted places, glue always ready for use, and hot water from the tank at all times ready. If he neglects his duties there is no need for the foreman to say anything, for the men will speak loudly and strongly! The careful loading of all works on to vans, paying special attention to see that it is well packed and securely fastened, the keeping of the shop clear of shavings and refuse, are part of his duties. He must be able to read the countenances and anticipate the coming wants of the joiners, be civil and obliging, and yet have sufficient courage to hold his own. Such men are to be found—some who have served three and four apprenticeships in the position.

No joinery should leave the works unless the rod numbers are clearly marked out, and should any questions arise on the receipt by the foreman on the job, the rod number should at all times be quoted for reference.

No Rod should be Destroyed

or defaced upon any condition until the works shown thereon is completely finished, because of possible disputes.

An index-book containing all rod numbers should always be kept in the foreman's office, with a description of work or any particulars relative thereto; and a copy from this same book should be kept in the office.

Time Sheets

in joiners' shops have always appeared to me somewhat costly, especially in view of the fact that every joiner is not of necessity an expert penman. I should prefer a time-keeper to go through the shop and take from each man daily the number of his rod and number of hours engaged. I feel convinced that a great saving of time would ensue and the possibility of mistakes be reduced to a minimum.

Some readers may think all this cost would be somewhat expensive, but I know from experience that, given a fair supply of work, material suited to the different classes of work, up-to-date and judiciously-arranged machinery, and such a foreman as I have described, and given a free hand and a fair test, results will be satisfactory to employer, foreman and employees: and the work carried out will redound to the credit of all concerned, while at the same time satisfying the architect.

THE LABOUR MARKET.

Board of Trade Returns for February.

THE Board of Trade returns show that employment in the building trades remained dull in February, but there was a slight improvement on the whole as compared with a month ago. It showed little change compared with a year ago.

Returns received from sixty-one London employers showed that in the last week of February they paid wages to 10,445 work-people of all classes, compared with 10,339 in January and 12,086 in February, 1905. Employment generally in London was much the same as in the previous month, but worse than a year ago.

Returns were received from employers' associations in seventy-one districts outside London, and in nearly all of these employment was reported as dull generally. Compared with a month ago, no change was reported in fifty-five towns, while in eight, including Birkenhead, Lancaster, Blackpool and Dublin, employment was better, and in eight, including Stockport, Chester, Rugby, Newport and Aberdeen, it was worse. Compared with a year ago, employment was reported about the same in forty-two towns, worse in twenty-two, and better in seven.

The following information is based on returns from trade unions and from local correspondents:—

Bricklayers.

With bricklayers employment was dull generally, and no better than a month ago. In many towns short time through bad weather was reported.

Stonemasons.

Employment with stonemasons was bad generally, and about the same as a month ago. Bad weather interfered with outdoor work in some districts.

Carpenters and Joiners.

With carpenters and joiners employment was better than a month ago in most districts, the chief improvements being in London, the Eastern Counties and Scotland, while there was some decline in Ireland, and a slight falling off in the Northern Counties and Yorkshire. Compared with a year ago, employment showed considerable improvement in Ireland, and a decline in Wales and Monmouth. The percentage of trade-union members unemployed at the end of February was 9.5, compared with 10.1 in January and 9.6 in February, 1905.

Slaters and Tilers.

With slaters and tilers employment was bad. In England it was worse than a month ago, but in Scotland showed some improvement. Short time was very general.

Plumbers.

With plumbers employment, as compared with a month ago, showed an improvement in the Eastern Counties and in Scotland; in London there was no change; and in most other districts there was a decline, the greatest falling off being in Ireland. Compared with a year ago there was a considerable decline in the East Midlands. The percentage of trade-union members unemployed was 12.1 at the end of February; in February, 1905, it was 12.5.

Plasterers.

With plasterers employment was bad. In Scotland it was worse than a month and a year ago, but in the rest of the kingdom there was some improvement as compared with January.

Painters.

Employment generally with painters was quiet, but showed considerable improvement on the previous month, and was rather better than a year ago. Short time was worked in some districts.

Employment with labourers showed little change, and was bad generally.

The Month's Trade.

(Reports by our Special Correspondents.)

STONE, GRANITE AND MARBLE TRADES.

There is very little change for the better to report in these trades. The labour returns of the Board of Trade again show that employment in February was slack, as it has been for many months. As regards limestone, the reports for February show, however, that employment continued good in Cumberland and Weardale; in Derbyshire it was adversely affected by bad weather. In the Bath stone quarries it was slack, with short time. Employment in the Plymouth district was quiet. In North Wales it was not so good as a month ago.

As regards other stone, employment was good, with considerable overtime, in chert quarries in Derbyshire. At Gateshead it was fair. In the Clee Hill road-material quarries and in grindstone and building stone quarries in the Rowsley district employment was moderate. It was generally slack in the Sheffield, Barnsley and Rotherham districts, and it continued bad in Forfarshire, with short time.

With granite workers employment continued dull in Aberdeenshire and bad in Devonshire and Cornwall. In Leicestershire it was fair.

As to settmaking, in Aberdeenshire employment was considerably affected through a dispute. In the Clee Hill district it was moderate, and in North Wales and at Airdrie and Edinburgh it was fair.

The returns for imports of stones, slabs and marble, rough, hewn and manufactured, for the month of February, 1906, as compared with the same month in 1904 and 1905, are as follows:—

Tons.			Value.		
1904.	1905.	1906.	1904.	1905.	1906.
86,311	87,409	87,631	99,680	91,374	98,158.

Portland Stone.

The quarrying operations at Portland have been very seriously interfered with during the month of February by gales, rains and inclement weather. Shipping has been disorganized. The output has therefore been restricted, but notwithstanding this the sales of stone have kept up, the stocks having been largely drawn upon.

Some very interesting stones have been discovered on the eastern side of the island, on land leased by the Bath Stone Firms, Ltd., with certain quarry marks indicating that they were quarried and squared at the time of the building of St. Paul's Cathedral. Three of these stones have been unearthed, and the portion containing the masons' marks copied off and made into keystones and presented to the local Masonic Mark Lodges.

One stone, however, is more interesting from the fact that it contains a quarry mark, namely, the letter Y, which we believe corresponds with the quarry mark of the stones to be seen at St. Paul's Cathedral, and this clearly indicates that these stones were quarried by master-masons in the seventeenth century under the supervision of Sir Christopher Wren. The remarkable thing about these stones is that the arris is very clean and sharp, although exposed to the sea, thus showing the durability of Portland stone.

The latest news at Portland is that the best portion of the Piccadilly Hotel, London—i.e., the Quadrant front—is to be built with stone from the quarries in the Kingbarrow district—the same from which stone was taken for building the new War Office.

Bath Stone.

At the Bath stone quarries the employment has been normal. All the quarry-owners have heavy stocks in hand ready in anticipation of the revival of trade. The

masons' yards at Box and Corsham are not working to their full capacity, and there is plenty of room for improvement.

According to the report of the Bath Stone Firms, Ltd., a new estate has been developed at Gastards, Corsham, where it has been discovered there is a large area of unquarried stone of fine quality. A working shaft has been sunk, and although nearly ready it will be some little time before the stone is put on the market. It is satisfactory to know this famous building stone is not likely to be exhausted for many generations.

At the well-known St. Aldhelm Box Ground quarries an unusual number of large blocks have been obtained, each not less than 6 tons in weight; the quality is exceedingly good, and it is likely to lead to an extended use of this excellent weather stone.

Bath Stone Firms.

The report of the Bath Stone Firms, Ltd., for the half year ended December 31st last, submitted at the meeting on March 16th, shows that the general slackness in the building trade has affected this successful undertaking. After providing for remuneration of directors and auditors, the nett profit for the half year ended June 30th, 1905, was £18,509, and for the half year ended December 31st, 1905, £13,185, and after adding balance brought forward from December 31st, 1904, £15,851, together £47,545. Comparing these figures with the previous year's we find that for the six months ended December 31st, 1904, the nett profit was £21,500, making the aggregate for the year about £44,100. The interim dividend paid in September last absorbed £15,896, and there now remains available for distribution £31,648. The directors recommend a dividend at the rate of 16 per cent. per annum, making 15 per cent. for the year, leaving a balance of £13,481 to be carried forward. The provision for depreciation is now £93,433. During the year the directors have secured a long lease of a large area of additional quarry land in the Bath stone district, which, with other leases acquired at different times since its formation, gives the company control over more unquarried land than at any period of its existence. The company's holdings in Portland have also been materially increased during the twelve months.

Marble.

There is little doing in the marble trade. A contract has been settled for the supply of a large quantity of marble work for Sir Ernest Cassel's new town house. The remarks in our first "Contractors' Supplement" still apply. It is peculiar that, while we have such fine marbles in England and Ireland, we should make such little use of them. The Belgians were, however, the first to realize the possibilities of the material, and the trade to-day is mostly in their hands; the French works running them close. One consequence of this is that our local marbles are not adequately developed, so that when an order is placed it is seldom that the material can be obtained from stock or in large blocks. The greatest amount of marble comes from Italy. Greek marbles probably come next, although only developed in recent years. They are, however, most beautiful, and superior to many Italian, Belgian and French marbles. The new German tariff has cut the Belgian marble works very hard, and being practically excluded from Germany it is natural that they should seek other outlets and endeavour to secure a larger share of orders from this and other countries. We hear that prices for marble work in this country have been cut 10 per cent., which will be a still further obstacle in the progress

of the few English works. The foreign workmanship is not, however, always satisfactory, because of the natural difficulties of working material so far removed from the job, and because of the competition. It is not realized by architects that great care, trouble, time and labour are required to produce a beautiful result in marble, just as in any other artistic craft.

The new commercial treaty between Belgium and Austria-Hungary which was concluded on February 12th favours Belgian marble workers by securing reductions in the customs tariff.

A Swedish green marble has recently come on the market. It is cheap, but looks very poor compared with the older known green marbles.

THE SLATE AND TILE TRADES.

The slate and tile trades show no improvement during the past month. The prices remain unremunerative, and competition among merchants to secure orders is keener than ever. The producers have made little alteration in their prices, though a slight rise has taken place in North Wales in the case of some of the larger sizes, the shortage in the supply of which we commented upon in a previous issue. On the other hand, in some districts in Wales prices for the smaller sizes have given way, presumably owing to the accumulation of stocks. Enquiries are rather more numerous, especially for the better class of work, but the trade will not feel the benefit of the result of these until next year.

The Board of Trade reports, as regards slate quarrying, that employment in February continued slack in the Festiniog district and in Carnarvonshire, with the exception of the Llanberis district. Employment was slack in Argyllshire, where only five days a week were worked.

Westmorland Slates

are readily procurable from most of the districts where they are produced, and reports generally indicate that fair though not excessive stocks are held by most of the quarries.

The output of this class of slate is governed a good deal by the weather. In one case within our recollection a quarry was unable to supply material for six weeks until the roads were re-made. To guard against exigencies of this kind many of the quarries keep a fair stock of slates at the railway sidings.

From Colleyweston

we hear the supply in no way equals the demand, which appears to be general over England. The normal output of this district is hardly sufficient to supply the new buildings erected in connection with the colleges at Oxford and Cambridge Universities.

The durability of these slates is surprising; some have been used recently at Trinity College, Cambridge, which are known to have been previously on the roofs of some farm buildings in Lincolnshire for a period of over 400 years.

The interest in this slate appears to have spread to America, where Messrs. Close & Sons, of Colleyweston, recently covered a large mansion at Westbury, Long Island, this, we believe, being the first occasion on which these slates have been used in America.

In order to make certain of securing material from the Colleyweston district the contract should be settled at the earliest possible moment, as the output of this material depends entirely upon the action of frost at certain periods of the year. The work is a speciality, as no ordinary slater, unless he had had years of experience and a special knowledge of this material, would be able to carry out the work successfully.

Welsh Slates.

The Welsh slate trade appears to be in much the same condition as last month, and there does not seem to be any immediate prospect of an improvement.

Tiles.

The reports from the various tile producing areas all tend to show that the demand for roofing and other tiles has been very small, although in some cases things have improved. In the Broseley district a few of the larger firms are maintaining their trade, but appear to be able to meet any reasonable demands made on them. Prices remain unaltered.

THE CLAYWORKING INDUSTRY.

There is little better to report in the clay-working industry this month. The trade seems as depressed as ever, though the increase for building that always comes in the Spring has its effects. The Board of Trade returns for February show that employment generally in the brick and tile trades during the month continued bad, and much the same as the previous month, a great deal of time being worked. In the Peterborough district, however, there was a slight improvement on a month ago, and employment was reported as fair in the Tees and Hartlepool district, and at Brierley Hill and Stourbridge. It continued good at Exeter and fair in South Wales.

The common brick trade in Flettons is not moving. Stocks remain as they were. The glazed brick trade is also without life, and the only thing doing is in glazed terra-cotta or faience and sanitary ware. The porous terra-cotta partition blocks have met with such remunerative results that other firms are entering the field with clays that are not quite good enough for the high fire-resistance required, or else are expensive to work.

Little, if any, recovery is perceptible in the results set forth in the report for the past year of Messrs. Stanley Brothers, brick and tile makers, Nuneaton, from the sudden decline in 1904, when the nett trading profits (£12,864) were less than half those for 1903. For 1905 they were £12,928. The dividend is again 6 per cent. Nothing is placed to reserve, to which £2,500 was added a year ago, mainly made up of premiums received on the issue of new capital, and the carry-forward is smaller at £7,631, as compared with £8,678.

THE PORTLAND CEMENT AND LIME TRADES.

There has not been much movement since our last report in February. The most hopeful feature in the trade is, that the exports of English Portland cement are showing satisfactory increases compared with the corresponding period of last year, and that the import of the cheap Belgian cement is rapidly decreasing. The imports of February were 7,000 tons less than a year ago. Should this state of things continue the statistical position of the trade should materially affect prices.

From contracts booked ahead it looks as if this country may export about 100,000 tons more during the year, while the imports may decline to the extent of 80,000 tons. The knowledge of this expected alteration of 180,000 tons in the balance of trade is making itself felt in the firmer attitude now being shown by the manufacturers. Buyers are no longer having things all their own way, which is a new experience after the depression which has now existed for five years. The arrival of Spring, with the longer working hours and finer weather, gives a brisker tone to the trade than that which naturally exists during the short and unfavourable winter days, and the accumulated stocks in the manufacturers' warehouses are expected to vanish with the melting snow.

The coal strike in France which now seems likely to spread to Belgium is resulting in a considerable advance in the price of coal, and as so much cement is now made on the rotary principle, this is an item which must result in enhanced cost of manufacture. Should the strike continue for any length of time, manufacturers will be compelled to ask a considerable advance for their materials. This is the more likely as everything which is required in the process of manufacture also seems dearer, such as cask staves, hoop-iron, nails, oil, sacks and coke.

The lime trade is very quiet, indeed—in fact, depressed would be a truer description. This article, unlike cement, is entirely dependent on the general building trade, and as this particular industry is universally slack, lime-burners are suffering accordingly.

The cheapness of Portland cement also reacts on the lime trade, because, as about 2 yds. of lime constitute a ton, the cost of lime almost equals that of cement, and as the latter article is so far superior and takes a larger aggregate, cement is being supplied where a few years ago (when the margin in prices was greater) lime would have been used.

The returns for imports and exports of cement for building and engineering purposes for the month of February as compared with the same month in 1904 and 1905 are as follows:—

		IMPORTS.		
		1904.	1905.	1906.
Tons	-	20,894	19,820	13,070
Value	-	£30,322	26,476	16,339
		EXPORTS.		
		1904.	1905.	1906.
Tons	-	24,800	26,977	36,318
Value	-	£41,671	44,149	54,524

Of the exports for February this year the Argentine Republic took 2,286 tons, British South Africa 9,632 tons, and the British East Indies 5,464 tons.

THE TIMBER TRADE.

The Board of Trade reports that employment in February with mill-sawyers and woodcutting machinists continued dull, but was rather better than a year ago. Trade unions with a membership of 4,611 reported 232 (or 5 per cent.) as unemployed at the end of February, compared with 5·2 per cent. at the end of January, and 5·8 per cent. in February, 1905. Employment was good at Coventry and Dundee; fair at Birmingham; improving at Nottingham, Newcastle-on-Tyne, and on the north-east coast generally; quiet at London, Glasgow, Bristol, Cardiff and Bradford; bad at Hull, Leicester, Liverpool, Bolton, Wolverhampton, Dublin and the Potteries.

The Liverpool Market.

Business in builders' timber for early delivery has been rather quiet, but for later delivery more business has been done. The consumption within the Liverpool trading area still continues fairly brisk, flooring boards, joists and roof timber being worked up rather freely. The London and North-Western Railway Co. are using a fair quantity of new sleepers on part of their Liverpool and Manchester main line, which will affect stocks of this class of timber. Heavy timber for weight-carrying purposes has been passed inland in good quantities for the large factory and works' building operations which are now in progress, notwithstanding the strong preference for iron and steel joists and girders.

Canadian pine and spruce deals have only been received in small quantities, and stocks of pine-deals show a total in standards one-quarter less than at the corresponding date last year; the stock of spruce deals, however, is nearly double that of a year ago, though the stock then was very small. Late values of Quebec pine deals have ranged from £23 to £33 per standard for first-quality yellow pine; £17 to £22 for seconds; £11 to £12 10s.

for thirds. St. John's spruce deals have been selling at £7 15s. to £8 per standard, but values have stiffened slightly, and 2s. 6d. more has been paid in late sales. Red pine deals have been in rather better demand. Oregon pine logs and planks have sold more freely. Stocks are reduced, but are still equal to fully five months' consumption, at the present rate.

Spruce and pine deals from New Brunswick and Nova Scotia have arrived in smaller quantities, but the deliveries have been steady, on the recent scale. The aggregate of stocks is slightly less than a month ago. The importation of red deals and boards from the Baltic has been very small, while the deliveries have been slightly greater. Norway flooring boards have been received in somewhat larger quantities. Planed whitewood boards, of first and second quality, mixed, have sold at £9 2s. 6d. to £9 5s. per standard; and third quality from £8 5s. to £8 10s. Redwood boards, planed, first quality, have sold at £11 to £11 2s. 6d. per standard. United States whitewood in logs and lumber has come to hand freely, and ample stocks are now held.

Pitch-pine continues in a very strong position, there being a good demand, with a light importation, and stocks correspondingly light. Values, however, continue at 1s. 4d. to 1s. 8d. per cub. ft. The arrivals of hewn pitch-pine have also been light, while the deliveries have been more than double what they were in the opening weeks of the year. Stocks are much reduced. The aggregate is less than half of what it was a year ago. The quotation remains at 1s. 3d. to 2s. per cub. ft. Planks have also come to hand in smaller quantities. Prime deals and boards have ranged from £16 to £17 10s. per standard.

Oak, of Canadian and American sorts, has been received in larger quantities, and stocks equal to four months' consumption are now in hand. A good supply of oak planks has been received. Stocks are larger than in the early part of the year, but are less than half of what they were a year ago.

East India teak has arrived more largely, but the arrivals leave a greater aggregate of stock, equal to a five months' consumption, at late demands. Planks have ranged from £16 to £17 5s. per load.

The interest shown in mahogany at the last auction sales conducted by Messrs. Farnworth & Jardine, and Alfred Dobell & Co. afforded a correct index to the state and prospects of the market for this timber. Useful and figurey woods find ready buyers at full prices, but inferior woods have to be traded on the best terms obtainable. A considerable stock of African and a fair stock of Cuban wood are in hand. African sorts have ranged in value from 2d. to 8d. per inch-foot; Cuban, from 4d. to 6½d. Generally the mahogany market is in a healthy state.

At the auction sales held by Messrs. Farnworth & Jardine on March 22nd and 23rd large quantities of mahogany were offered, all of African growth.

THE GLASS TRADE.

The glass trade, notwithstanding the depression in the building trades, is fair. The Board of Trade returns for February show that with sheet-glass makers and flatteners at St. Helens employment continued good. It had improved with pressed-glass makers in the Tyne and Wear district. With plate-glass bevellers and silverers at Birmingham it was quiet. Employment was fairly good with glass-blowers in London.

Messrs. Pilkington Brothers, Ltd., have recently added two further patterns to their figured rolled glass, namely Persian and Japanese. We referred last month to the fact that these figured glass patterns can now be had picked out in colours, as many as three different ones in one sheet being obtainable.

IRON AND STEEL TRADE.

Recent Progress.

The record of the steel market has always displayed that infinite variety which age cannot wither nor custom stale. From that historic bear in small steel which followed the deluge of arms from the legions of Darius into the camp of Alexander, to the present day, causes beyond any man's control have produced strange vicissitudes.

At the time of the last issue of this supplement we were able to paint the prospect in Turneresque tints: the trend of affairs, as subsequent events have proven, having then about reached their zenith. To-day, however, though the colour of affairs is far from sombre, we are obviously in a well advanced state of transition.

Nevertheless we may be permitted to doubt whether all those undiluted jeremiads to which we are treated from many sources are to be accepted as correctly representing the present situation. Booms cannot last for ever, and a boom in the steel trade is always most aggressively regarded by those who are not its direct beneficiaries, and *no lens volens* the most transient of its kind. If, then, this little boom of ours still retains a trace of vigour it should not be unduly importuned to move off the stage, and when it has departed let us at least accord it a decent burial.

Looking backward for a brief space, the first few days of this month were not remarkable for any great degree of enthusiasm in the manufacturing centres; in fact, even then, there was an obvious tone of pessimism in the general opinion of various markets.

On the Tyne and the Clyde, it is true, considerable demand prevailed among ship-builders, and the *status quo* was fairly well maintained. Generally, however, enquiries were not so numerous as they might have been, but such shading as there was in manufactured iron and steel did not result in any marked economies to other than the larger buyers.

Birmingham early reported the sale of "common" bars at £7 2s. 6d., as against the official quotation of £7 5s.

There was a distinct improvement in the exports of iron and steel from the North of England during February, the Middlesbrough customs reporting shipment of 72,740 tons of pig iron, 14,435 tons of manufactured iron and 31,000 tons of steel, the aggregate increase over January being 15,000 tons.

In this district the slight downward tendency, although far too evident to be ignored, was rather regarded as one of those inevitable lulls which are always to be looked for in any upward movement. The fact that this period of the year is essentially one of advances rather supported this view than otherwise. Probably on this latter account the fact that makers continued to produce regardless of the falling off in demand, and the excess thus created, rather increased the tendency towards depression. Manufacturers, of course, were not actually in want of orders, although fresh bookings were far from numerous.

The range of prices during the first week of March was somewhat as follows:—Common bars and iron angles, £7 5s.; steel angles, £6 12s. 6d.; steel joists, £6 7s. 6d. All these prices were liable to be shaded for good orders.

In the Midlands the situation was not essentially different, save that the cheering influence which the shipbuilding activity gave to the Northern markets was, of course, lacking.

In best finished iron the price of £9 was well maintained. Rolling stock makers kept busy, but no attempt was made to do business in iron bars at the official figure of £7 5s., the actual selling prices having been but little over £7.

The associated makers' quotation of £12 7s. 6d. for corrugated sheets pretty well represented the market, and most firms were inclined to toe the line and keep the figure firm. Angles ranged from £6 10s. to £6 17s. 6d., joists from £7 to £7 2s. 6d., and girder plates from £7 12s. 6d. to £7 17s. 6d.

On the whole, reports from Scotland were more consistently hopeful than elsewhere, and prices were well maintained and new business fairly plentiful. The price of structural steel shapes showed no signs of weakening, and demand continued good.

The Present Position.

As the month has advanced the general tone has become more confident in many quarters. Not that any appreciable improvement in the month's opening prices has taken place, but there has not been that consistent slackening of demand which the pessimists prophesied at the commencement of the month.

In Staffordshire bar-iron a fair trade has been done, and the £9 figure is still in force. In common bar-iron it must be acknowledged that current orders are running out more rapidly than new orders are being entered, but makers have been able to do business at prices approximating the official figure of £7 5s.

In the Midlands steel makers do not seriously entertain the idea of easier prices. All works are fairly well booked with orders, and deliveries are still comparatively slow.

In Sheffield orders came in more freely towards the middle of the month and prices were steadier. Some good railway orders were booked for home and abroad.

In Scotland, as well as in the Cleveland district, the outlook has brightened up by comparison with the beginning of the month, and there has been a steady flow of orders, although none were heard of carrying remarkable dimensions.

Steel joists kept pretty firm at £6 7s. 6d. and angles at £6 12s. 6d., and on the whole there need be no serious dissatisfaction if the position is maintained.

The following comparison of London prices with those of March of last year is interesting as showing that there is still a very fair factor of safety to work upon:—

	Mar. 1905.	Mar. 1906.
Staffs marked bars -	£9 0 0	£8 0 0
" common -	7 5 0	6 0 0
Steel angles, Middlesbrough -	6 15 0	5 15 0
Glasgow -	6 15 0	5 10 0
Steel plates, Middlesbrough -	7 0 0	5 17 6
Glasgow -	7 7 6	6 2 6
Steel rails, Middlesbrough -	6 5 0	5 2 6

In Continental steel prices have kept fairly well in sympathy with the movements on this side. There are no active signs as yet of the anticipated rise in the price of rolled steel joists and channels. It is too early yet, however, to say that the advance will not take place, and the progress of events during the next few weeks will be interesting to watch. Meanwhile, as a matter of fact, a slow but consistent downward movement has taken place through the month, although latterly prices have been a little firmer, and to-day things are just beginning to pull themselves together again.

The figure for a fair basis specification, delivered ex steamer Thames or c.i.f. equal ports, for joists, is about £5 10s. per ton nett; for channels £5 15s. nett.

Angles are quoted at £5 18s. to £6 and Tees about £6 3s. 6d., all delivered ex steamer Thames, or c.i.f. equal East Coast ports.

Belgian bars in these latter shapes are selling at somewhat lower prices than the German, and both seem inclined on the whole to remain fairly firm.

Deliveries are better than they were earlier in the year, but Continental makers generally are inclined to look forward to improved business in the near future. Much depends

on the events of the next few weeks, and in the meanwhile it is not safe to be at all dogmatic.

Other Metals.

A decided improvement has taken place in the lead market during the past week or two, and a slow but steady advance in prices is expected. Considerable forward buying is reported. Soft foreign for delivery over April is selling at somewhere in the region of £10 and upwards, English at £16 10s., and pipes at upwards of £19.

Better demands have also been remarked in spelter, especially for prompt deliveries. Prices for G.O.B.'s touching such a figure as £25 7s. 6d., mark a decided improvement, as do special brands at £25 10s. to £25 15s.

In this connection it is interesting to note a report from South Wales that arrangements are contemplated for erecting four new furnaces at the Upper Bank Works, Swansea.

The market in galvanized sheets has nothing alarming to report; things have in fact been somewhat quiet latterly. The price for 24-gauge corrugated lines of £12 7s. 6d. f.o.b. remains firm, and no downward movement is anticipated. A rather encouraging item of news records the receipt of some heavy indents in galvanized sheets from Australia, and a further demand is expected from the same quarter.

Copper, again, has displayed a certain degree of firmness, the fluctuations being of a very mild order, and recent quotations in the region of £82 (standard) bid fair to be well maintained.

News Items.

The production of pig-iron in Germany last year was 11,000,000 tons as compared with 10,000,000 in 1904.

The estimated cost of rebuilding Blackfriars Bridge, for which Parliamentary sanction is being sought, is given as between £200,000 and £250,000.

The proposal of the Swedish Government to put an export duty on iron ore has been shelved, pending certain negotiations with Germany.

An iron and steel company has been formed, with a capital of over £1,000,000 sterling, to develop the Gurumashini mines in Bengal.

The British Government contemplate including £10,000 in the estimates for the coming financial year for buildings and equipment at Teddington for the National Physical Laboratory.

Forty six vessels, aggregating 77,336 tons, were launched in Scotland during the first two months of this year, as against twenty-five vessels and 69,076 tons during the same period of 1905.

It is reported that blast furnaces are about to be erected at Lithgow, in New South Wales. Coal and coke are to be obtained on the spot, and ore mines are within 100 miles.

There is considerable activity in the marine engineering shops on the North-East coast. One firm has orders for over fifty sets of marine engines—sufficient to keep them going to the end of the year.

In reply to a question in the House of Commons in regard to the appointment of a Minister of Commerce, the Premier stated that he saw no prospect of the matter being dealt with this session.

A new type of universal plate mill, recently patented, is to be erected in South Chicago. The mill will be driven by an 8,000-h.p. electric motor, and will be the first of its size to be electrically driven.

The continued falling-off in the shipbuilding industry in the United States is indicated in the recently published records, which show the number of ships built in 1905 as 1,054, gross tonnage 306,563, as against 1,065 ships and 365,104 tons in 1904.

THE WALLPAPER TRADE.

The wallpaper trade continues fairly good. Foreign competition is not a very serious amount, although imports are more than a year ago, though less than in January. Our exports, however, remain stationary, as the following return of paper-hangings for February will show; though January's export was more than for a year ago:—

IMPORTS.					
1904.	Cwts.	1905.	1904.	1905.	1906.
—	4,499	5,818	—	£12,528	£16,198
EXPORTS.					
1904.	Cwts.	1905.	1904.	1905.	1906.
8,573	8,305	8,242	£23,342	£22,802	£22,173

THE IRONMONGERY TRADE.

The builders' ironmongery trade continues depressed. In the goods used by the engineering trades business is good. The Board of Trade returns for February show that employment at Wolverhampton in the lock and latch trade continued depressed, more short time being worked than a month

ago. It was fair on cast-iron hollow-ware and good on iron fences and hurdles. In the hollow-ware trade it was good at Wigan, fair at Birmingham and West Bromwich, but remained slack at Sheffield.

Employment in the stoves, grates, &c. trades was fair at Falkirk and quiet at Rotherham. At Glasgow short time was worked, but a slight improvement was shown compared with a month ago.

With nut and bolt makers employment continued good at Darlston, and fair at Birmingham and in South Wales. With wire-nail, shoe-rivet and cut-nail makers at Birmingham it continued fair. At Black Heath with nail workers it was fair, but with rivet makers it was not so good as a month ago.

As regards wire employment continued good on the whole, and rather better than a year ago.

The returns for imports and exports for February 1906, as compared with the same month in 1904 and 1905, are as follows:—

IMPORTS.					
1904.	Tons.	1905.	1904.	Value.	1906.
Wire nails	2,224	2,617	£22,364	25,187	37,515
Nails (other than wire nails), screws and rivets	1,150	917	17,010	16,375	18,105
Bolts and nuts	391	358	5,226	5,625	6,325
EXPORTS.					
1904.	Tons.	1905.	1904.	Value.	1906.
Nails, screws and rivets	1,556	2,134	31,162	36,303	43,326
Bolts and nuts	1,322	1,198	22,320	22,139	32,618

THE PAINT TRADES.

The paint trades are fair. As regards materials, the returns for imports and exports for February, 1906, as compared with the same month in 1904 and 1905, are as follows:—

IMPORTS.					
1904.	1905.	1906.	1904.	1905.	1906.
	Cwts.			Value.	
White lead	27,971	22,080	£22,037	17,881	21,433
Zinc oxide	120,730	113,835	79,481	14,532	19,031
Other colours and pigments	29,237	105,829	61,003	60,343	62,235
Turpentine	11,935	43,969	108,936	84,127	54,445
Lac-dye, seedlac, shellac and sticklac	—	6,528	—	48,657	59,544
Linseed oil	473	50	8,820	868	43,162
EXPORTS.					
1904.	Cwts.	1905.	1904.	Value.	1906.
White lead	24,171	23,130	23,643	22,332	29,675
Zinc oxide	104,732	4,049	158,731	5,116	28,822
Other colours and pigments	95,127	111,704	121,969	148,201	—
Linseed oil	2,013	2,220	42,850	39,890	38,652

MISCELLANEOUS.

The Indian Tariff.—From inspection of the list of general duties under the import tariff of British India we find that a duty of 5 per cent. will be charged on the estimated value of hardware and ironmongery, but machinery and parts thereof may be imported free. The duty on iron and steel is 1 per cent. and the duty on lead, tin and zinc 5 per cent., and on building and engineering materials such as asphalt, bricks and tiles, cement, fireclay, stoneware pipes, lime, &c., is 5 per cent. on the estimated value.

The new Tariff Regulations of Brazil increase the former duties on many goods. The following new rates apply to our readers:—Oxide of lead 400 reis per kilog.; pine or fir trunks 20,000 reis per cub. metre, boards,

planks and joists 25,000 reis per cub. metre; cast-iron ingots 20 reis per kilog.; iron plates 130 reis per kilog.; steel plates 150 reis per kilog.; rolled iron 140 reis per kilog.; rolled steel 160 reis per kilog.; iron and steel wire 150 reis per kilog.; stoves, furnaces, &c., 300 reis per kilog.; plain cast-iron goods 300 reis per kilog.; painted &c., cast-iron goods 500 reis per kilog.

Production of the U.S.A.—The following table showing the estimated production of the more important minerals and metals in the United States in 1905, as compared with the preceding year, is taken from the "Engineering and Mining Journal" (New York). The estimates, it is stated, are made by authorities in each branch, on substantial data:—

	Unit.	1904.		1905.	
		Quantity.	Value.	Quantity.	Value.
Carborundum	lb.	7,060,380	706,038	3,940,000	394,000
Cement, natural hydraulic	bb. (a)	4,866,331	2,450,150	4,500,000	2,250,000
" Portland	" (b)	26,505,881	23,355,119	31,000,000	32,000,000
" slag	" (b)	303,045	226,651	300,000	210,000
Copper, sulphate	lb.	63,234,557	3,161,728	52,405,009	2,751,263
Copperas (d)	short t.	16,956	118,692	20,392	142,744
Iron ore	long t.	29,462,839	51,559,868	44,054,197	79,372,135
Lead, white	short t.	126,336	13,899,913	130,192	15,874,384
" red	"	13,938	1,672,569	14,635	1,858,645
Litharge	short t.	12,487	1,248,691	13,111	1,573,320
Pyrites	long t.	173,221	669,124	189,201	650,412
Zinc-lead	short t.	6,781	474,670	7,200	540,000
" oxide	"	57,613	4,524,031	65,403	5,232,240
" ore, exported	"	35,911	905,782	26,597	738,532
Copper (c)	lb.	817,715,005	106,302,950	925,267,840	145,257,798

(a) Barrels of 300 lbs. (b) Barrels of 380 lbs. (c) Value computed on average of Lake copper at New York. (d) Only that marketed as copperas.

Note.—Short t. = 2,000 lbs.; long ton = 2,240 lbs.

THE LIVERPOOL DISTRICT.

In the building industry of the Liverpool district the winter which, meteorologically, has now closed, saw more activity than has been usual in winter seasons of former years. This has been due largely to the great mildness of the weather, brick-laying, stone-laying and plastering operations having gone on without any stoppage on account of frost.

Six large jobs have been in hand in Liverpool. These have been: The completion of the extensive new hospital for infectious diseases at Fayakerley; the erection of the large block of buildings which will form the head offices of the Mersey Docks and Harbour Board, on the site of the old George's Dock; the erection of the new Cotton Exchange in Old Hall Street, and of the new head offices for the Liverpool tramways department in Hatton Garden; the reconstruction of the Children's Infirmary; and the prosecution by the Corporation of a large scheme for providing workmen's dwellings, on the Hornby Street area.

Three other building projects have also found work for different branches of the building trade. These have been the large schemes of dock reconstruction at the north and south ends of the docks estate (which have entailed among other things the building of extensive blocks of quayside sheds), the finishing-off of an enormous granary and silo on the east side of the Queen's Dock, and the earlier operations in the erection of the Liverpool Cathedral at St. James's Mount. In addition a considerable amount of house-building has been in progress, especially on the east and south-east border lines of Liverpool, in the West Derby, Old Swan, Tue Brook, Wavertree and Garston districts. For a winter season, therefore, the building industry of the district has been well and busily employed.

Most of the work spoken of has made a large demand primarily for common bricks for inside walls and backing work. Pressed smooth-faced red bricks and white-faced glazed bricks for special facing-work have also been much used. For large buildings steel is coming into greater use. The new offices of the Mersey Docks and Harbour Board, the new dock sheds, and the new Cotton Exchange exemplify this strikingly; while in Manchester a new building for which the Manchester Iron & Steel Co. are now constructing a frame, at the bottom of Victoria Street, on the east side, is another example of this.

At the new Liverpool Cotton Exchange, part of the extensive north face, in Edmund Street, is constructed of cast iron, the surface between the windows being ornamented by wreath and flower work cast in relief. This use of cast iron is quite new to Liverpool. The main elevation of the Cotton Exchange is of stone. The work is being carried out by the Waring-White Building Co., and is now far advanced.

The use of concrete for building purposes is slowly extending in the Liverpool and Manchester districts. A year ago, an experimental block of twelve workmen's dwellings of concrete was erected by the Corporation of Liverpool. A new water tower for the Urban District Council of Newton-le-Willows has just been constructed of ferro-concrete, under the Hennebique patents, by Mr. L. G. Mouchel, of Manchester and London. The tower supports a cylindrical tank of 300,000 gallons capacity 63ft. above ground-level. Both the tank and its supports are of ferro-concrete.

On the Stenhill estate, Halton, Cheshire, houses are being erected of concrete. Machines have been set up for making the blocks, on the site, from materials found in the locality.

Complete List of Contracts Open.

With a few exceptions, news of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issue of other contracts that still remain open.

Unless expressly stated to the contrary all deposits required for bills of quantities, &c., are returned on receipt of bona-fide tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair-wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

Mar. 29. Cork.—Two semi-detached villas on the Old Blackrock Road, in accordance with plans and specification which may be inspected at the offices of W. H. Hill & Son, architects and civil engineers, 28, South Mall, Cork, with whom tenders are to be lodged on or before Mar. 29.

Mar. 29. Nottingham.—Cricket pavilion, tool-house, &c., on the Meadows New Recreation Ground. Plans may be seen and copies of specification, bill of quantities and form of tender obtained from Frank B. Lewis, city architect, Guildhall, on payment of a deposit of £1 1s. Sealed tenders, endorsed "Tender for Cricket Pavilion, &c., Meadows Recreation Ground," to be delivered at the Town Clerk's Office not later than 6 a.m. on Mar. 29.

Mar. 29. Eastney.—Church hall and mission buildings in Eastfield Road, Eastney, according to drawings, specifications and conditions, which can be seen and quantities obtained at the office of the architect, G. E. Smith, "Glendore," 145, Victoria Road North, Southsea, between 10 and 4 and on Saturday 10 to 12. Sealed and endorsed tenders are to be delivered at the St. James' Vicarage, Milton, by noon on Mar. 29.

Mar. 29. Cardiff.—Internal alterations to the premises of Fulton & Dunlop, Ltd., at the corner of Duke Street and St. John Square. Drawings may be seen and bills of quantities obtained on deposit of £1 1s. Tenders to be delivered to Edward H. Bruton, F.R.I.B.A., architect, 119, Queen Street, Cardiff, not later than 10 a.m. on Mar. 29.

Mar. 29. Cefn-Coed.—Thirty-nine houses. Particulars can be obtained from R. Cound Jenkins, architect, Cefn-Coed. Tenders to be sent in by Mar. 29.

Mar. 29. Guildford.—Portland cement for the ensuing twelve months, for the Town Council. Specifications and forms of tender may be obtained at the office of the borough surveyor, C. G. Mason, A.M.I.C.E., Tuns Gate, Guildford. No tender will be considered which is not upon the prescribed form. Tenders, endorsed "Tender for Cement," to be sent to F. S. Miller, town clerk, Town Clerk's Office, Bridge Street, Guildford, by noon on Mar. 29.

Mar. 29. St. Austell.—Two cottages at Trethurgy, St. Austell, for Joseph Payne. Plans and specifications may be seen at Alsovear Farm, Trethurgy. Sealed tenders will be received not later than Mar. 29.

Mar. 29. Stafford.—Bedroom accommodation, &c., for eight laundrymaids at the County Asylum. Drawings and specification of the proposed work may be seen at the offices of Walter H. Cheadle, county surveyor, Stafford. Applications for bills of quantities to be made on or before Mar. 29, accompanied by a deposit of £2 2s. Fair wages clause.

Mar. 30. Shrewsbury.—Additions to workhouse, consisting of a dayroom, stone-breaking cells, bathroom, iron gangway and staircase, for the Guardians of the Atcham Union. Plans and specifications can be seen at the Union Offices, St. John's Hill, Shrewsbury, and any other information can be obtained from A. B. Deakin, Pride Hill, Shrewsbury, the architect to the Guardians. Tenders, under seal, endorsed "Tender for Buildings," to be sent to Joseph Everest, clerk to the Guardians, Atcham Union Offices, St. John's Hill, Shrewsbury, by Mar. 30.

Mar. 30. Penarth.—Building a large hall and assembly-room. For bill of quantities and to see plans, &c., apply J. Coates Carter, Bank Buildings, St. Mary Street, Cardiff. Tenders to be sent in by Mar. 30.

Mar. 31. Forres.—Additions and alterations to the Mechanics' Hall Buildings. Plans and specifications of the works may be seen with the Architect, and offers to be lodged with John Forrest, architect and surveyor, Forres, by noon on Mar. 31.

Mar. 31. Maesteg.—Fifty cottages on Tonnadefaid Estate, Nantyffyllon, Maesteg, for the Tonnadefaid Building Club. Plans and specifications may be seen at the Mining Offices, Maesteg. Sealed tenders to be sent to J. P. Gibbon at the above offices, endorsed "Tender," not later than Mar. 31.

Mar. 31. Wallsend-on-Tyne.—Six houses in flats at Station Road, for the Industrial Co-operative Society, Ltd. Plans and specifications may be seen on personal application at the Society's offices, Carville Road, Wallsend-on-Tyne. Tenders returnable not later than Mar. 31.

Mar. 31. Wookey Hole.—Alterations and additions to the Council School at Wookey Hole, near Wells, for the Somerset County Education Committee. Drawings and specification can be seen at the schools. For any further information apply to Hans Price & William Jane, architects, Weston-super-Mare. Tenders to be delivered to the County Education Secretary, Weston-super-Mare, on or before Mar. 31.

Mar. 31. Aberdare.—Colliery offices at Cwmaman, Aberdare, for the Cwmaman Coal Co., Ltd. Plans, &c., may be seen at the offices of Morgan & Elford, architects, 1, Jeffrey Street, Mountain Ash, or 42, Canon Street, Aberdare, to whom endorsed tenders must be sent by Mar. 31.

Mar. 31. Nantyffyllon.—Presbyterian Church at Nantyffyllon, near Maesteg. Plans and specification may be seen and bills of quantities obtained on deposit of £1 1s. Sealed and endorsed tenders are to be delivered to Arthur Lloyd Thomas, engineer and architect, Church Street Chambers, Pontypridd, by Mar. 31.

Mar. 31. South Brent.—House, for H. T. Mackenzie. Drawing may be seen at the office of T. W. Latham, architect, Kingsbridge, and bills of quantities obtained on payment of £1 1s., to whom tenders are to be delivered by 11 a.m. on Mar. 31.

Mar. 31. Worcester.—Restoration of Cleeve Prior Church. Apply with 5s. deposit to C. F. Whitcombe, architect, Newbury, Broadheath, Worcester. Tenders to be sent in by Mar. 31.

Mar. 31. Whitby.—Alterations to old buildings at Spital Bridge, for the Urban D. Council. For particulars apply to T. K. Scott, R. D. Council Offices, Whitby. Tenders to be sent in by Mar. 31.

Mar. 31. Trefonen.—Reconstruction of schoolrooms, classrooms, cloakrooms, urinals, &c., at the Trefonen, Oswestry, National Schools, in accordance with drawings, (1 to 5) and specifications prepared by W. Penant Ellis, architect and surveyor, Town Hall, Rhyl, North Wales. Drawings may be seen and a copy of the specification, also form of tender, obtained from H. O. Stokes, Underhill, Trefonen, as above, on payment of a deposit of £1 1s. Tenders, sealed and endorsed "Tender, Trefonen, Oswestry, National Schools," must be delivered at Underhill, Trefonen, not later than 10 a.m. on Mar. 31.

Mar. 31. Coseley.—Stripping and re-tiling of a portion of the roof of Hurst Hill Council Infants' School, and for supplying of fountain heads, &c. Particulars may be obtained at the Education Offices, Green Street, Coseley. Samples of brindle and blue valley tiles will be required from the firm whose tender is accepted, and the tenders should reach Frederick J. C. Toole, secretary to the Education Committee, Coseley, not later than Mar. 31.

Mar. 31. Slough.—Eight-stall stable at Manor Farm, Dorney, for the Urban D. Council. A plan, specification and particulars may be seen and a form of tender obtained at the Surveyor's Office, 1, Mackenzie Street, Slough, on payment of a deposit of £1. Sealed tenders, endorsed "Stables," addressed to the Chairman of the Drainage Committee, 11, Mackenzie Street, Slough, to be delivered on or before Mar. 31.

Mar. 31. St. Keverne.—New Wesleyan church. Builders desirous of tendering are requested to send their names to Stuart Rule, St. Keverne, before Mar. 31.

Mar. 31. Mortomley.—Proposed Catholic schools and adjoining residence, at Mortomley, near Sheffield, for the Rev. Father De Baere. Applications for bills of quantities must be made to Arthur Hartley, architect County Chambers, Castleford, Yorkshire, before Mar. 31.

April 2. Rotherham.—New business premises at the corner of Doncaster Gate and Wellgate. Builders wishing to tender must forward their names and addresses, accompanied with a deposit of £3 3s., to J. Platts, architect, &c., High Street, Rotherham, by April 2.

April 2. Banbridge.—Dispensary and dispensary residence for the use of the medical officer of the Crossgar Dispensary District, in the township of Crossgar, convenient to the village of Dromare, according to the plans and specifications prepared by W. W. Larmor. The Guardians desire that the materials used in the above works shall be, as far as possible, of Irish manufacture. The contractor must undertake to have the whole of the works completed on or before Oct. 31. Sealed tenders, addressed "To the Presiding Chairman," on the special form, and containing the names and addresses of two solvent sureties willing to join with contractor in a joint and several bond for double the amount of the contract, will be received at the Poor Law Office, Workhouse, Banbridge, up to noon on April 2.

April 2. Murcia.—Museum and school to be constructed at the upset price of 188,751 pesetas (about £6,435), in accordance with conditions set forth in the "Gaceta de Madrid," a copy of which can be seen at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, E.C. A deposit of 8,570 pesetas (about £292) is required to qualify any tender. Tenders will be received at the Municipal Offices at Cartagena and Lorca and at the offices of the Secretary to the Institute, Murcia, by April 2.

April 2. Pontypridd.—Twenty-five cottages at Rhydfelen, near Pontypridd. Plans and specification may be seen and quantities and form of tender obtained at the office of the surveyor, P. R. A. Willoughby, A.M.I.C.E. Sealed tenders, endorsed "Workmen's Houses," must be received by J. Colenso Jones, clerk to the Council, District Council Offices, Pontypridd, by April 2.

April 2. Armley.—Erection of Wesleyan Church with spire. Quantities may be obtained from W. J. Morley, F.R.I.B.A., & Son, architects, 269, Swan Arcade, Bradford, to whom tenders must be sent by April 2.

April 2. Newtown.—Repairs and improvements at the following Council Schools:—Llangynog, Llangurig, Glandwr (Llandloes), Wern (Llanbrynmar), Cwm (Llanllugan), Hafod (Llanerfyl). Plans and specifications may be seen on application to the Clerk at the Education Offices, Newtown; and any further information may be obtained, if desired, on written application being made to

the County Surveyor, Welshpool. Tenders are to be sealed and marked on the outside "Tender," and are to be forwarded so as to be received by the Clerk to the Education Committee, County Education Offices, Newtown, by April 2.

April 2. Bispham.—Dwelling-house in Hesketh Place. Plans and specifications may be seen, and bills of quantities obtained, upon application to G. Moss, 13, Hesketh Avenue, Bispham. Tenders to be sent to Thomas Kershaw, A.R.I.B.A., architect, Lancashire and Yorkshire Bank Chambers, Halifax, by April 2.

April 2. Bradford.—Alterations to the Church Institute. Plans may be seen and quantities obtained from T. H. and F. Healey, architects, 42, Tyrryl Street, Bradford, to whom tenders must be delivered by April 2.

April 2. Leeds.—Block of shop premises at Hyde Park Corner, for Joseph Pickersgill. Names must be forwarded to Thomas Winn & Sons, architects, 84, Albion Street, Leeds, by April 2.

April 4. St. Breward.—Cottage at the Kennels, St. Breward, for the North Cornwall Hunt Committee. Plans and specifications can be seen at the residence of N. Hosken, to whom tenders must be sent by April 4.

April 4. Portland.—Justice room, adjoining the police-station. Plans and specifications may be seen, and bills of quantities and forms of tender obtained, of the County Surveyor, at his office, Wimborne, or at the Shire Hall, Dorchester. The sum of £2 2s. will be charged for the bills of quantities. Tenders, marked "Justice-room, Portland," must be sent to E. Archdall Fooks, clerk to the Standing Joint Committee, County Council Offices, Sherborne, by April 4.

April 4. Withington.—Alterations and additions to the lunatic wards at the workhouse. Plans, &c., may be seen and bills of quantities obtained at the offices of Charles Clegg & Sons, architects, 21, Spring Gardens, Manchester, on payment of £1 1s. Sealed tenders, enclosed in the official envelope, to be delivered to D. S. Bloomfield, clerk to the Guardians, Union Offices, All Saints, Manchester, not later than 12 a.m. on April 4.

April 4. Arboe.—New parochial residence at Arboe, co. Tyrone. Plans and specifications can be had on application to Rev. James Loughran, P.P., Arboe; or at the offices of E. & J. Byrne, architects, offices, 4, Waring Street. Tenders to be forwarded not later than April 4.

April 4. South Shields.—Improvements at Hilda Colliery wagonway, Station Road. The work embraces the construction of a tunnel, 14ft. span, together with excavation and concrete retaining walls for railway cutting under Station Road. General and detail drawings may be seen and a copy of the form of tender, conditions, specification, quantities, &c., and other information obtained at the office of S. E. Burgess, M.I.C.E., borough engineer and surveyor, Chapter Row. Tenders, on forms supplied (to be fully priced out in the schedule and totalled), must be delivered to the Town Clerk, Court Buildings, South Shields, not later than 4 p.m. on April 4, endorsed "Tender for Station Road Tunnel."

April 5. St. Ervan.—Repairs for the Cornwall Education Committee, according to the specification which may be seen at the said schools or at the office of the architect, B. C. Andrew, Biddick's Court, St. Austell. Forms upon which all tenders must be made may be had from the architect or the secretary. Sealed endorsed tenders to be sent to F. R. Pascoe, secy., Education Office, Truro, by April 5.

April 5. Woodbridge.—Ventilating and making small alterations to the board-room, for the Guardians. Plans and specifications of the proposed work may be seen at the office of Brown & Burgess, architects, Arcade Street, Ipswich. Sealed tenders, endorsed "Alterations to Board-room," to be delivered at the board-room not later than 10 a.m. on April 5.

April 6. Kemplar.—Rebuilding a small bridge a Kemplar, near the village of Dufton, for the East Westmoreland Rural D. Council. Plans and specifications may be seen at the Surveyor's Office, Kirkby Stephen. Sealed tenders, endorsed "Dufton Bridge," must be delivered at the office of William Hewitson, Appleby, the clerk to the said Council (where also plans and specifications may be seen), not later than April 6.

April 6. Boyndie.—New central school and teacher's house for the School Board. Plans and specifications to be seen with John M'ulloch, clerk to the School Board, Boyndie, and offers, marked "Tender for School Buildings," to be lodged with the clerk of the Board not later than April 6.

April 7. Ashill.—Repairs at the Council School. Specification and further particulars at the office of Samson & Cottam, architects, Bridgwater. Sealed tenders must reach the County Education Office, Weston-super-Mare, before noon on April 7.

April 7. Puriton.—New offices and for alterations at the Council School. Plans, specifications and further information at the office of Samson & Cottam, architects, Bridgwater. Sealed tenders must reach the County Education Office, Weston-super-Mare, before noon on April 7.

April 9. Kingston-on-Thames.—Pulling down of old premises and erection of new offices and workshops for Knapp, Drewett & Sons, Ltd., as follows:—New

premises for the "Surrey Comet" offices, at No. 20, Clarence Street, Kingston-on-Thames; new workshop on land at rear of No. 18, Church Street, Kingston-on-Thames (adjoining above-named premises). In accordance with specifications, quantities and drawings prepared by William H. Hope, C.E., architect and surveyor, of Hampton Wick, Middlesex, and Billingham, Sussex, who will give any further information required. The plans may be seen and copies of specification and quantities obtained on application to the Secretary, Knapp, Drewett & Sons, Ltd., 20, Clarence Street, Kingston-on-Thames. A deposit of £2 2s. for these particulars is required by the Company. Sealed tenders, duly endorsed, to be delivered to the Secretary as above, not later than 10 a.m. on April 9.

April 9. Lancaster.—*Alteration and extension to the administrative block at the Sanatorium.* Plans and conditions may be seen, and bills of quantities obtained, on application at the office of J. C. Mount, borough surveyor. Sealed tenders to be delivered to T. Cann Hughes, town clerk, Town Hall, Lancaster, by 9 a.m. on April 9.

April 9. Salford.—*Storerooms and pump-house at the Electricity Station, Frederick Road, Pendleton.* Drawings may be seen, forms of tenders and bills of quantities obtained at the Borough Engineer's Office, Town Hall, Salford. Tenders, endorsed "Storerooms, Electricity Station," addressed to the Chairman of the Electricity Committee, must be delivered to L. C. Evans, town clerk, Town Hall, Salford, by 5 p.m. on April 9.

April 10. Hastings.—*Four cottages in the parish of Brede, adjoining the pumping station of the New Waterworks, for the Corporation.* Drawings and specification may be seen and form of tender and bill of quantities obtained at the office of the borough engineer, P. H. Palmer, M.I.C.E., Town Hall, Hastings, between 10 and 5, on payment of a cheque for £1 1s. Sealed tenders, endorsed "Tender for Cottages at Brede," must be delivered at the Town Clerk's Office, Town Hall, Hastings, not later than noon on April 10.

April 10. London, S.E.—*Improving the Alverton Street School, Deptford, S.E., by providing new classrooms, teachers' rooms, halls, staircases, cloak-rooms, lavatories, w.c.'s, covered playground, new drainage scheme, &c., for the London County Council.* Persons desiring to submit tenders may inspect the drawings and specification and obtain the bills of quantities, form of tender and other particulars at the Education Offices (Architects' Department), Victoria Embankment, W.C., on payment to the cashier of the sum of £5. Tenders must be upon the official forms, and the printed instructions contained therein must be strictly complied with. Fair wages clause. Each tender must be enclosed in an envelope (which will be provided) and delivered at the Education Offices (Room 148), Victoria Embankment, W.C., not later than 11 a.m. on April 10.

April 10. London, W.—*Working men's flats.* The Council of the royal borough of Kensington invite tenders for the demolition of the existing houses, Nos. 4, 6 and 8, Hesketh Place, and 5 and 6, Thomas Place, Notting Dale, and the erection on the site thereof of two buildings, to contain respectively eighteen and eight one-room tenements, in accordance with specification and drawings, which can be obtained at the office of Town Clerk, Town Hall, Kensington High Street, W. Persons proposing to tender will be required to deposit £3 3s. with the borough treasurer at the Town Hall, when applying for a form of tender. Fair wages clause. Sealed tenders, and endorsed "Tender for Working Men's Flats," must be delivered at the Town Clerk's office not later than 4 p.m. on April 10.

April 12. Kendal.—*Proposed alterations and additions to Broom Close, Kendal.* Plans may be seen and quantities and specifications obtained at the office of John F. Curwen, F.S.A., F.R.I.B.A., architect and sanitary engineer, 26, Highgate, Kendal, to whom tenders must be sent not later than noon on April 12.

April 12. Antrim.—*Labourers' cottages in the rural district, for the Rural D. Council, in accordance with plans and specifications, which can be seen at the office of the clerk of the Council, or at the office of the architect, W. T. R. Taggart, Scottish Provident Buildings, Belfast, as follows:*—Two cottages at Townparks, Antrim, on the lands of Dr. Gawn; two cottages at Townparks, Antrim, on the lands of Mrs. Young; one cottage at Islandbawn, Muckamore, on the lands of John Clark; one cottage at Ballyear, Carmoney, on the lands of William Houston; one cottage at Ballyrobin, Muckamore, on the lands of Scott Gilliland; one cottage at Killiyad, Randalstown, on the lands of John Fulton; one cottage at Annaghmore, Toomebridge, on the lands of B. O'Boyle; one cottage at Portlee, Toomebridge, on the lands of Mrs. McCann; two cottages at Ballynamullen, Toomebridge, on the lands of Felix Lavery; one cottage at Tamnadrery, Randalstown, on the lands of James Gilbert; four cottages at Cranfield, Randalstown, on the lands of James Charleton; two cottages at Cranfield, Randalstown, on the lands of Bernard O'Kane; one cottage at Cranfield, Randalstown, on the lands of Mrs. Hume; two cottages at Ballydonagh, Crumlin, on the lands of John McCullurg; two cottages at Ballyshanagill, Crumlin, on the lands of John Nelson; two cottages at Feehogue, Randalstown, on the lands of Lord O'Neill; four cottages at Lurgan West, Randalstown, on the lands of Lord O'Neill; one cottage at Ballygrooby, Randalstown, on the lands of G. L. Young; two cottages at Craigmore, Randalstown, on the lands of J. H. Mulligan; two cottages at Ballymacilhoyle, Crumlin, on the lands of W. S. Thompson. Persons tendering may do so for any or all of the different blocks, but they must name the particular site or sites on their tender. Tenders are to be lodged with J. Clark, clerk of Council, Union Office, Antrim, by 10 a.m. April 12.

April 14. Wakefield.—*New school at Sandal, near Wakefield.* Stainforth (Thorne Union) Provided School: new cloak-room, &c., &c.; Castleford Wheldon Lane Provided School: alterations, repairs, &c. A deposit of £1 is required for each of the above schools, which will be returned on receipt of a bona-fide tender. Cheques, &c., to be sent to the West Riding Treasurer. Builders desirous of tendering must send in their names to J.

Vickers-Edwards, county architect, County Hall, Wakefield, by April 14.

April 21. Mold.—*Alterations and extensions to the County School, Mold, Flintshire, North Wales.* Plans and specifications may be seen at the offices of the architect, Samuel Evans, N. & S.W. Bank Buildings, High Street, Mold, from whom bills of quantities may be obtained on payment of a sum of £2 2s. Tenders to be made out on forms to be supplied, and sent in to W. R. Howard Evans, solicitor, Mold, clerk to the Governors, by April 21.

April 23. Coventry.—*Nurses' home, for the Coventry and Warwickshire Hospital Committee, in accordance with plans and specifications prepared by the architects, A. Hessel Tiltman, F.R.I.B.A., 1, Raymond Buildings, Gray's Inn, London, W.C., and Herbert W. Chattaway, Trinity Churchyard, Coventry.* Plans and specifications may be seen at the Architect's Office, Trinity Churchyard, Coventry, and bills of quantities and forms of tender can be obtained upon depositing the sum of £3 3s. Tenders, sealed and endorsed "Nurses' Home," to be sent to Ellis E. Crisp, secy., Coventry and Warwickshire Hospital, Stoney Stanton Road, Coventry, not later than 10 a.m. on April 23.

No date. Cairo.—*Erection of Courts of Justice at Sembellawein, Kafr-el-Zayat, Facos and Santa.* Tenders should be addressed to the Ministry of Public Works, Cairo. The conditions, &c., may be seen at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, E.C.

No date. Cork.—*Rebuilding premises at the corner of Grand Parade and George's Street, for O'Sullivan & Son.* All particulars may be obtained on application to the architect, Arthur Hill, B.E., M.R.I.A., 22, George's Street, Cork.

No date. Trancreek.—*Church.* Drawings and specifications may be seen at J. H. Clemens, The Bracken, Newquay.

ENGINEERING.

Mar. 30. Sunderland.—*Steam alternator, &c.* For the supply of one 750-kilowatts triple-expansion engine direct-coupled to three-phase generator, 5,000 volts, with exciter; one 300-kilowatt static transformer; two portable air-compressors, for the Corporation. Forms can be obtained on application to the borough electrical engineer, J. F. C. Snell, M.I.C.E., Town Hall, Sunderland, and on payment of a deposit of £1 1s.

April 2. Dover.—*One rectangular surface pattern condenser and one Edwards' air-pump with requisite valves.* Specification, with general conditions, form of tender, &c., can be obtained from the borough electrical engineer, L. W. Woodman, Electricity Works, Park Street, Dover, on payment of a deposit of £1 1s. Additional copies of specifications, 2s. 6d. each. Tenders on the prescribed form, endorsed "Tender for Condensing Plant," to be delivered to Wollaston Knockner, town clerk, Castle Hill House, Dover, by April 2.

April 2. Aston.—*Telephone installation, to establish communication between the various blocks of buildings in connection with the workhouse at Gravelly Hill.* Specification and conditions of contract may be seen, and forms of tender obtained, at the office of W. H. Whitehouse, 37a, Waterloo Street, Birmingham, electrical engineer, and tender endorsed "Workhouse Telephones," must be received by John North, clerk to the Guardians, Union Offices, Vauxhall Road, Birmingham, by April 2.

April 2. Ullapool.—*Works in connection with the water supply of the village.* There will be about one mile of 4-inch cast-iron pipe, and 1,100 lineal yds. of 2-in. cast-iron pipe in village, replacing the present lead service pipes, with the necessary connections as per schedule. Plan and specification can be seen with A. G. Joass, surveyor, Dingwall, and the local water manager will point out the line of the pipe tracks. Sealed tenders for the work to be lodged with Wm. Mackenzie, clerk, Mid-Ross District Committee, by April 2, marked on outside of envelope "Tender for Water Supply, Ullapool."

April 4. Barnsley.—*Construction of a house to receive the chalk-mixing apparatus, &c.* Drawings, and specification may be inspected, and forms of tender and schedules of quantities may be obtained on payment of £2 2s. on application at the office of J. Henry Taylor, Manor House, Barnsley, and at the offices of T. and C. Hawksley, civil engineers, 30, Great George Street, Westminster, S.W., and tenders must be delivered at the office of Henry Horsfield, town clerk, Barnsley, by 10 a.m. on April 4.

*** April 4. The Hague.**—*Railway and bridge materials, for the Netherlands Colonial Office.* Contract 414—The metal superstructure and appurtenances for 57 railway bridges. Contract 415—150 axles with wheels for railway carriages and waggon. Particulars may be obtained from Mr. M. Nijhoff, at the Hague, at a cost of 6 fl. (10s.) for contract No. 414 and 2 fl. (3s. 4d.) for contract No. 415. Tenders will be received up till April 4.

April 5. London, W.—*Alterations to the heating and hot-water works at the Infirmary in the Marloes Road, Kensington, for the Guardians, in accordance with specifications, plans and bills of quantities, which may be seen upon application to the Clerk between 10 and 4 and Saturdays between 10 and 1.* Sealed tenders, upon the form supplied, must be delivered at the Guardians' Offices, Marloes Road, Kensington, W., by 1 p.m. on April 5.

April 5. Hackney, N.E.—*Condensing works, for the Hackney Borough Council, as follows:*—Specification No. 26.—Condensing water-supply works, including brick screening chamber by the River Lee, intake and overflow pipes, subways, &c. General conditions, specification, drawings, form of tender and form of agreement may be inspected at the offices of Robert Hammond, M.I.C.E., consulting engineer to the Council, 64, Victoria Street, Westminster, S.W., and may be obtained there on making a deposit of £5. Extra copies of the specification may be obtained by bona-fide tenderers at a charge of 5s. per copy, which sum will not be refunded. Fair wages

clause. Tenders, sealed and marked "Tender for Condensing Works," must be addressed to W. A. Williams, town clerk, Town Hall, Hackney, and delivered by 4 p.m. on April 5.

April 5. Lisbon.—*Metal bridge over the river Mondego, at Martyr Santo.* Tenders will be received at the Ministry of Public Works, Lisbon, up to April 5.

April 6. Greenock.—*Electric lighting, electric lift telephones and electric bells for new combination hospital, presently in course of erection at Gateside, Inverkip Road, Greenock, according to plans and specifications by John Dixon, A.M.I.M.E., consulting engineer.* Schedules of quantities and forms of tender can be obtained on application to the Clerk, Municipal Buildings, Greenock, on payment of a deposit of £1 1s. for each schedule. Sealed tenders on the prescribed form must be delivered at the Town Clerk's Office, Greenock, not later than 11 a.m. on April 6.

April 6. Hitcham.—*Digging the trench and laying about 1,950 yds. of cast-iron water main, 3 ins. diam., with valves and hydrants; also for the construction of a small concrete reservoir, at Hitcham, Suffolk.* The pipes, valves and hydrants will be provided by the Council, but the carting from Stowmarket Station will be included in the contract. Plans can be seen and copies of specification obtained on deposit of £1 1s. on application to Henry Miller, engineer, 16, Museum Street, Ipswich. Tenders to be sent to Alfred Newman, clerk, Hadleigh, Suffolk, by 10 a.m. on April 6.

April 7. Madrid.—*Dam construction in the port of Motrico, Bilbao.* Apply to Direccion-General de Obras Publicas, Madrid. Tenders to be sent in by April 7.

April 7. Madrid.—*Construction of a breakwater at the port of Arrecife, Island of Lanzarote, Canaries, at the estimated cost of 927,191 pesetas (or about £32,000), in accordance with conditions set forth in the "Gaceta de Madrid," a copy of which may be seen at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, E.C. A deposit of 9,271 pesetas is required to qualify any tender. Tenders will be opened on April 7 at the Directorate General of Public Works, Madrid.*

April 9. Haslemere.—*Extension of heading in well, lining of well, construction of reservoir, and laying cast-iron pipes, fixing valves, &c., for the Hambleton Rural D. Council.* Copies of the specification and form of tender can be obtained at the offices of R. B. Grantham & Son, 23, Northumberland Avenue, London, W.C., on payment of a deposit of £3 3s. Sealed tenders, which must be on the prescribed form and endorsed "Haslemere Waterworks," must be sent, addressed to Ferdinand Smallpiece, clerk to the Council, Guildford, on or before April 9.

April 10. Loughborough.—*Waterworks.* Providing, carting and laying about 1,300 yds. of 6 in., 2,300 yds. of 4 in., and 3,500 yds. of 3 in. cast-iron mains, providing and fixing valves and other fittings, together with building valve and other chambers and other works in connection with the supply of water to Shepshed, for the Corporation. The drawings may be inspected at the offices of the engineer, A. H. Walker, A.M.I.C.E., Town Hall, Loughborough, and conditions of contract, specification, quantities and forms of tender obtained from him upon payment of £2 2s. Sealed tenders upon the form supplied, addressed to the Chairman of the Water Committee, Town Hall, Loughborough, are to be delivered not later than 5 p.m. on April 10, endorsed "Tender for Shepshed Mains."

April 10. Lisbon.—*Metal bridge over the River Velto or Veride, in accordance with conditions set forth in the "Diario do Governo," a copy of which may be seen at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, E.C.* Tenders will be opened at the Ministry of Public Works on April 10. A deposit of 400 milreis (about £90) is required to qualify any tender.

April 11. Portballintrae.—*Waterworks, for the Ballymoney Rural D. Council.* Plans, sections, details, specification and quantities have been prepared by the Engineer, and may be seen at the Clerk's Office, or at the offices of J. A. McCormick, engineer, Diamond, Coleraine. Copies of quantities, together with form of tender, may be obtained from the Engineer on payment of £2 2s. Proposals, endorsed "Tender for Portballintrae Waterworks," properly sealed, are required to be in the hands of T. B. Hamilton, clerk, Rural D. Council, Boardroom, Ballymoney, by April 11.

April 13. Liscard.—*Extension to the engine and boiler-house at the Generating Station, Seaview Road, for the Wallasey Urban D. Council.* Drawings can be inspected and a copy of the specification and quantities procured at the Electrical Engineer's office, on the site, on payment of £2 2s. Also for the supply and delivery on seat of new boilers; also a 500-k.w. steam-driven single-phase alternator, to be delivered and fixed at the generating station. Copies of specification for Nos. 2 and 3 may be obtained at the Engineer's Office on payment of £1 1s. All tenders, endorsed "Tenders for Buildings," "Boilers" or "Steam Generator," as the case may be, to be delivered per post to H. W. Cook, clerk and solicitor to the Council, Public Offices, Egremont, Cheshire, not later than noon on April 13.

April 21. Salford.—*750-k.w. steam turbo-generator and condensing plant, for the Corporation.* Plans, specification and form of tender may be obtained from the Borough Electrical Engineer, Electricity Works, Frederick Road, Pendleton, on payment of a deposit of £2 2s. All enquiries in connection therewith to be addressed to the Borough Electrical Engineer at the above works. Sealed tenders, endorsed "Tender for Turbo-Generator," to be delivered to the Town Clerk, Salford, by April 21.

May 7. Sydney (New South Wales).—*Plant.* For supply and erection of boilers, automatic stokers, pipe work, &c.; turbo-alternator, sub-station machinery, switch boards, &c., for the Municipal Council. Forms may be obtained on application to T. Rooke, at the offices of Preece & Cardew, 8, Queen's Gate, Westminster, on deposit of £5 5s. Tenders to be sent in by May 7.

June 1. Luxemburg.—Supplying electricity to the town of Luxemburg for lighting and tramway traction. Full particulars may be obtained from the "Collège des bourgmestres et échevins, Luxemburg."

No date. Hyde.—Steel gasholder tank. For the supply and erection of a steel gasholder tank, 12ft. in diameter and 24ft. gins. deep, with two-lift telescopic gasholder and connections, for the Gas Co. Specifications and drawings may be seen on application to Thomas Newbigging & Son, engineers, 5 Norfolk Street, Manchester, and a copy of bill of quantities may be obtained from the Engineers on deposit of £2 2s.

IRON AND STEEL.

Mar. 30. Manchester.—Two 36-in. sluices, with cast-iron connecting pieces and shields, for the Corporation waterworks. Particulars may be obtained on application to the Secretary, Waterworks Offices, Town Hall, Manchester, on payment of £1 rs. Tenders must be delivered to Wm. Henry Talbot, town clerk, Town Hall, Manchester, not later than Mar. 30.

April 2. Haslemere.—Cast-iron cylinders, pipes, valves, hydrants, &c., for the Hambledon Rural D. Council. Copies of the specification and form of tender can be obtained at the offices of R. B. Grantham & Son, 23, Northumberland Avenue, London, W.C., on payment of a deposit of £2 2s. Sealed tenders, which must be on the prescribed form and endorsed "Haslemere Waterworks," must be sent, addressed to Ferdinand Smallpiece, clerk of the Council, Guildford, on or before April 2.

April 3. London, W.—About 200 tons of girder work and other steel and iron work of British manufacture, for the Great Western Railway. Plans and specification may be seen and forms of tender and bills of quantities obtained at the office of the Engineer at Paddington Station between 10 and 4. Tenders, marked outside "Tender for Girder Work," must be sent to G. K. Mills, secy., Paddington Station, London, by April 3.

April 3. Christiania.—Steel plates, for the Norwegian State Railways. Sealed tenders, marked "Anbud paa Leyerance af Staalplader," should be addressed to "Maskiningenrens Kontor, Bispesgaden 12, Christiania," where they will be received up to 3 p.m. on April 3. The steel plates required must be of the best mild steel. The quantity is divided into twenty-three lots of varying sizes and thicknesses. Prices are to be quoted in kroner per kilog. for each lot, delivered free at the State railway works yard in Christiania. Customs duty will be refunded to the deliverer if the plates are received in good condition. Tenders are to state when the goods can be delivered; great importance is attached to speedy delivery. Conditions of tender (in Norwegian) and drawing may be inspected at the offices of the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, London, E.C.

April 3. Belfast.—Enlargement of a cast-iron water tank at Ormeau Avenue Baths, and alternative tenders for the erection of a new tank. Specification and form of tender may be obtained on application at the City Surveyor's Office. Sealed tenders, endorsed "Tender for Storage Tank," must be sent in to R. Meyer, chief clerk, by April 3.

April 3. Orpington.—Wire fences, &c., at the sides of the approach road from the existing hospital to the small-pox hospital at Crofton Heath, Orpington, Kent, for the Bromley and Croydon Joint Hospital Board, in accordance with the plan and specification, which may be seen during office hours at the Board's Offices. Tenders, to be made on the prescribed form, which may be obtained from the Clerk, must be delivered at the office of the Board, Park House, Bromley, by 3 p.m. on April 3.

April 4. London, S.W.—Supply and erection of wrought iron boundary fencing at Bethnal Green Gardens, N.E., for the London County Council. Persons desiring to submit tenders may inspect the drawing and obtain the specification, bill of quantities, form of tender, and other particulars at the Parks Department, 11, Regent Street, S.W. Tenders must be upon the official forms, and the printed instructions contained therein must be strictly complied with. Fair wages clause. Each tender is to be delivered at the County Hall, in a sealed cover addressed to the Clerk of the London County Council, Spring Gardens, S.W., and marked "Tenders for wrought-iron boundary fencing, Bethnal Green Gardens." No tender will be received after 10 a.m. on April 4.

April 4. Sunderland.—Steel, copper and cast-iron pipes, for the Corporation, for the extension of their Hylton Road Electricity Station. The specification and form of tender can be obtained on application to the borough electrical engineer, John F. C. Snell, M.I.C.E., Town Hall, Sunderland, and on payment of a deposit of £1 rs. Sealed tenders, addressed to the "Chairman of the Electricity and Lighting Committee," Town Hall, Sunderland, must be endorsed "Steam and other Pipes," and delivered at the Town Clerk's Office not later than noon on April 4.

April 7. Wishaw.—370 tons or thereby of 12-in. cast-iron gas pipes, with the necessary specials, drip-boxes and valves, for the Town Council. Also for the cutting and filling of the track for the laying of the above pipes. Plans of the proposed pipe track can be seen and forms of tender can be obtained on application to P. B. Watson, city engineer, Wishaw. Tenders to be lodged with John Logan, town clerk, Wishaw, not later than April 7.

April 9. Lockerbie.—Steel and iron work required in the renewal of roof over Dumfries Dock Lines, at Lockerbie Station, for the Caledonian Railway Co. Drawings may be seen at the office of the Company's District Engineer, Princess Street Station, Edinburgh, where copies of the specification and schedule may be obtained on payment of £2 2s. Sealed tenders, endorsed "Tender for Steel and Iron Work required in the renewal of the roof over Dumfries Dock Lines, Lockerbie Station," to be lodged with J. Blackburn, secretary, Caledonian Railway Company's Offices, 302, Buchanan Street, Glasgow, by April 9.

April 25. Adelaide.—For the supply of the following materials, delivered in bond, on wharf, Port Adelaide, wharfage to be paid by the contractor:—33 best mild steel boiler plates; 19 best mild steel smokebox tube plates for flanging (eight drawings, 1s. each); 10 copper tube plates (five drawings, 1s. each); 1,450 solid-drawn best toughened copper tubes; 25 solid-drawn best copper pipes; 200 volute springs (one drawing, 1s.); 12 best steel straight axle forgings (one drawing, 1s. 6d.); 19 bars channel steel (two drawings, 1s. each); 93 bars angles steel (two drawings, 1s. each); 340 mild steel plates; 150ft. of iron chain; 300 private locks (one drawing, 1s.); 281 solid-drawn mild steel tubes. Specifications may be seen and forms of tender obtained at the Supply and Tender Board Office, and the office of the Chief Mechanical Engineer, Islington, South Australia; specifications may also be seen at the office of the Agent-General for South Australia, 28, Bishopsgate Street Without, London, E.C. Copies of indent, with specifications complete (13s. each), and drawings may be obtained at the Chief Mechanical Engineer's Office, Islington, South Australia. Date of delivery, as well as the names of manufacturers of the materials tendered for, must be distinctly stated in each tender. The materials are subject to the inspection, test and approval of the Government Inspecting Engineer in London, or the Chief Mechanical Engineer in Adelaide. The expenses of the inspecting engineer will be paid by the Agent-General, London (except in cases as specified), who will also advance 75 per cent. on the contract on receipt of bills of lading, insurance policy and the usual shipping documents, accompanied by the certificate of the inspecting engineer; and the balance of the contract will be paid in Adelaide or London, at the option of the contractor, upon satisfactory delivery of the materials. Successful tenderers will be required to make a deposit equal to 5 per cent. of the total value of their accepted tender as security. Tenders, which should be endorsed "Tender for Railway Materials," will be received at the Supply and Tender Board Office, Adelaide, up till 3 p.m. on April 25.

PAINTING AND PLUMBING.

Mar. 31. Frodingham.—150 cwt. of lead pipes ranging from 1/2 in. to 1 in. in diameter, and for plumber's solder, for the Brumby and Frodingham Water Supply. Forms of tender may be obtained from J. Green, surveyor, Council Office, Frodingham, Doncaster, on payment of a deposit of 10s. Sealed tenders, on the forms supplied, endorsed "Tender for Pipes," must be delivered to G. S. Sowter, clerk to the Council, Brigg, by Mar. 31.

Mar. 31. Penrith.—Painting the public street lamps, for the Urban D. Council. Particulars may be obtained on application to Shaul, Gas Works, Penrith. Sealed tenders, endorsed "Lamp Painting," must be delivered to the Clerk, Town Hall, Penrith, by Mar. 31.

E. W. Berrington & Son, Bank Buildings, Wolverhampton, or at the Council Offices, Greetland, upon payment of £5 ss. Sealed tenders, upon the forms supplied, endorsed "Tender for Sewage Tanks and Filters," must be delivered at the office of A. T. Longbotham, clerk to the Council, 41, Carlton Street, Halifax.

April 2. Cawston.—*Drainage work for the Aylsham Rural D. Council.* Specification can be seen, and particulars obtained from Henry J. Gidney, clerk to the council, Aylsham, to whom tenders must be sent by April 2.

April 2. Burley-in-Wharfedale.—*Alterations and additions to the sewage-disposal works, including the building of a pumping station fitted with oil engines, centrifugal pumps, liquefying tanks and continuous filters, in accordance with the plans and specifications prepared by the engineers, Haller & Macbell.* Plans and specifications may be seen and form of tender and bills of quantities obtained at the offices of the Engineers, Corporation Chambers, Dewsbury, on the payment of a deposit of £2 ss. Seated tenders, on form supplied, and endorsed "Sewage-disposal Works," must be delivered at the Clerk's Office, 5, Ramsey Terrace, Otley, not later than noon on April 2.

April 3. Leigh.—*9-in. stoneware pipe sewer, about 233 yds. in length, near the Green, Leigh, Tonbridge.*

Drawing and specification may be seen at the clerk's office. Sealed tenders, and endorsed outside, must be sent to George F. Carnell, clerk of the Rural D. Council, Sevenoaks, by April 3.

April 4. Watford.—*Re-drainage of houses, 1-47, Fearnley Street, for the Watford Urban D. Council.* Persons desirous of tendering for the work may see the drawings and specification, &c., at the offices of the Council, 14, High Street, Watford. Sealed tenders, endorsed "Tender for Fearnley Street Drainage," must be delivered to H. Morten Turner, clerk to the Council, Council Offices, Watford, by April 4.

April 6. Renfrew.—*Scavenging of the district, which comprises part of Renfrew parish, including Scotstoun, Scotstounhill, Jordanhill, Anniesland, and Yoker, all on the north side of the River Clyde, for one or two years, commencing May 16, 1906.* Full information and forms of specification can be had from J. R. Parker, clerk, 76, Fulbar Street, Renfrew, with whom sealed tenders, marked "Offer for Scavenging," must be lodged not later than noon on April 6.

April 7. Monmouth.—*Works of drainage, with necessary manholes, &c., at the union workhouse, for the guardians of the poor of the Monmouth Poor Law Union.* Plans, specification and conditions of contract may be seen and form of tender obtained at the Union Offices, Monmouth, or at the offices of Ernest G. Davies, M.S.A., Hereford and Monmouth, architect to the Guardians. Sealed tenders, which must be on the form obtainable as above and endorsed "Union Drainage," to be sent to T. A. Williams, clerk to the Guardians, Union Offices, Monmouth, by April 5.

TIMBER.

April 2. Stockholm.—*Supply of 1,900,000 kilos. of creosote oil for the use of the Swedish State Railways.* 1,500,000 kilos. are to be delivered at Motala, in about five equal quantities, between 15th May and 15th July, and the remaining 400,000 kilos. at Töreboda during July. With the tenders a sample of at least two litres of the oil must be supplied. A copy of the specification and form of tender (in Swedish) together with the special regulations for testing creosote oil, may be inspected at the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, London, E.C. Sealed tenders, marked "Anbud a Kreosotolja," should be addressed to "Kungl. Järnvägsstyrelsens Registrator, Stockholm," where they will be received up to noon on April 2.

April 2. Manchester.—*Supply of the following timber during twelve months ending April 30, 1907, for the Lancashire and Yorkshire Railway Co.:—Crossing timber, fencing (larch), sleepers.* Further particulars and forms of tender may be obtained on application to—Duffin, stores superintendent, Osborne Street, Manchester. Tenders, properly endorsed and addressed to the directors, must be lodged with R. C. Irwin, secretary, Hunt's Bank, Manchester, by 10 a.m. on April 2. Separate forms of tender will be provided for each contract; parties applying are therefore requested to state the particular contract for which they propose to submit tenders.

April 3. London, S.W.—*Oregon pine, for the Crown Agents for the Colonies, acting on behalf of the Administration of the Central South African Railways, about 97,000 cub. ft. of Oregon pine, known on the Liverpool market as "Select Quality" are required.* Forms of tender, with specifications and conditions of contract, may be obtained on application at the office of the Crown Agents for the Colonies, Whitehall Gardens, London, S.W., between 10 and 4 (Saturdays 10 to 1), on payment of a deposit of £1 per copy. Tenders to be delivered in sealed envelopes, addressed to the Crown Agents for the Colonies, endorsed "Tender for Oregon Pine, C.S.A.R.," by noon on April 3.

April 4. Glasgow.—*For the supply of ash and hickory handles for the Corporation.* Specification and form of tender can be obtained on application to James Dalrymple, general manager, 46, Bath Street, Glasgow. Sealed tenders, marked "Tramways—Tender for —," must be lodged with A. W. Miles, town clerk, City Chambers, Glasgow, by 10 a.m. on April 4.

April 4. Gravesend.—*70 fathoms of best Swedish yellow deal and batten ends (whitewood and boards will not be accepted) to be delivered into the Wood Yard of the Workhouse, Arthur Street, Gravesend, by July 2.* Tenders must be made on forms, which will be supplied on application. The Guardians do not bind themselves to accept the lowest or any tender. Tenders marked "Firewood," are to be sent to William John King, clerk to the Guardians, Town Hall Buildings, Gravesend, not later than 4 p.m. on April 4.

MISCELLANEOUS.

Mar. 29. London, E.C.—*Tools and stores, for the Burma Railways Co., Ltd.* Specifications and forms of tender may be obtained at the Company's Offices, 199, Graham House, Old Broad Street, E.C. For each specification a fee of ros. will be charged which will not be returned. Tenders, enclosed in sealed envelopes and marked "Tender for Miscellaneous Tools and Stores," must be delivered not later than noon on Mar. 29.

Mar. 29. Hampton.—*Supply of the following material, for the Urban D. Council, for one year:—Hand-broken blue Guernsey, quonset, basalt or Cleve Hill stone; granite chippings; broken Kentish brown flints and Derbyshire limestone marble tar-paving material.* Forms of tender, conditions and all particulars can be obtained at the offices of the Council, Hampton, Middlesex, where tenders, duly filled up, must be delivered, sealed and endorsed "Tender for —," not later than 4 p.m. on Mar. 29.

Mar. 30. Manchester.—*Supply of the following materials for the Corporation waterworks:—Sluice valves, manhole frames, firecock boxes, &c., lead piping, oil and paints, hydraulic valves and fittings.* Particulars may be obtained on application to the Secretary, Waterworks Offices, Town Hall, Manchester. Tenders must be delivered to William Henry Talbot, town clerk, Town Hall, Manchester, 1.01 later than Mar. 30.

Mar. 31. Wath-upon-Deane.—*Supply of the following materials, for the Urban D. Council:—Granite and whinstone macadam; hand-broken furnace slag; machine-broken turnace slag; unbroken slag; limestone screenings; slag screenings, and lime.* Particulars and forms of tender may be obtained from H. Cecil Poole, engineer and surveyor, Town Hall, Wath-upon-Deane, to whom sealed tenders should be forwarded, endorsed "Tender for Materials," by Mar. 31.

Mar. 31. Thornaby-on-Tees.—*Supply of the following materials:—Broken whinstone; whinstone setts; stoneware pipes; York curb; cement; smithwork; lamp posts; gulleys; castings; picks; shovels; brooms; coals; pitch, tar; horse hire; cartage; disinfectants, &c.* Specifications may now be seen and forms of tender and other particulars obtained on application at the Borough Engineer's Office, Town Hall. Sealed tenders, properly endorsed as directed on tender forms, must be delivered at the Town Clerk's Office, Town Hall, Thornaby-on-Tees, not later than 10 a.m. on Mar. 31. No tender will be considered except on the forms provided.

Mar. 31. Nottingham.—*Construction of new tramways.* Contract No. 1 will comprise the supply and delivery of 450 tons of steel tramrails and 21 tons of fish-plates. Contract No. 2 will comprise the supply and delivery of 250 tramway poles and fittings. Contract No. 3 will comprise the supply and delivery of 10,000 tons of 3-in. by 3-in. granite setts. Drawings may be seen and copies of the specifications and forms of tender may be obtained on applying to Arthur Brown, M.I.C.E., city engineer, Nottingham, on payment of a deposit of £1 is. for each contract. Fair wages clause. Sealed tenders, endorsed "Tramrails," "Tramway Poles," or "Granite Setts," as the case may be, are to be delivered to Samuel G. Johnson, town clerk, Guildhall, Nottingham, by Mar. 31.

Mar. 31. Swinton.—*Supply of the following materials, for the Urban D. Council:—Welsh granite macadam; Welsh granite 6-in. by 3-in. setts; grit setts; flags and curbs; limestone chippings; brushes; lime, and 2-in. artificial (concrete) flags.* Specifications, forms of tender may be obtained on application to H. Entwistle, engineer and surveyor, Council Office, Swinton, Manchester. All tenders must be sent in the envelopes provided, endorsed "Tender for —," to W. T. Postlethwaite, clerk to the Council, Council Offices, Swinton, not later than Mar. 31.

April 3. Linton.—*Tools, gulleys and gratings, for the Rural D. Council.* Tenders to be delivered not later than noon on April 3, addressed to A. M. Cook, engineer and surveyor, Linton, Cambridgeshire.

April 3. Cork.—*Supply of the following stores, for the Harbour Commissioners:—Timber; iron; paints; oils; metal castings; nails; screws; files, &c., in accordance with printed forms prepared for same, which may be had on application at the Engineer's Office, Lapp's Quay, Cork.* A preference will be given to goods and materials of Irish manufacture. Tenders, marked "Tenders for —," to be deposited in the tender box provided for the purpose at the Commissioners' Offices, 9 and 10, Lapp's Quay, Cork, not later than 4 p.m. on April 3.

April 4. Herne Bay.—*Supply of the following material, for the Urban D. Council:—Disinfectants; stoneware pipes and stoneware goods; lias lime and Portland cement; tools, implements and general ironmongery; smith's works and repairs; gravel and flints, and castings.* Forms of tender, conditions and full particulars may be had on application to F. W. J. Palmer, surveyor to the Council, Town Hall, Herne Bay. Sealed tenders, endorsed "Tender for No. —," must be delivered to Joseph Jubb, clerk to the Council, Clerk's Office, Town Hall, Herne Bay, by noon on April 4.

April 7. Bedford.—*Two tip wagons for the removal of house refuse, two street watering vans and three general purpose carts, for the Corporation.* Full particulars can be obtained upon application to the Borough Surveyor, Town Hall, Bedford. Sealed tenders, endorsed "Tender for New Vans, &c.," and addressed to the Chairman of the Streets and Buildings Committee, to be delivered at the Borough Surveyor's Office by noon on April 7.

April 9. Edinburgh.—*Supply of the following materials for the Edinburgh and Leith Corporations' Gas Commissioners:—Oils and paints, timber, meters, wrought-iron tubes and fittings, cast-iron pipes and connections, gas fitters' stores, iron, steel and implements, iron castings, &c., &c., caseway repairs, required for their various undertakings during the year from Whitsunday.* Tender forms and all information can be had on application to the Chief Engineer and Manager, at the Gasworks, New Street. Offers must be lodged not later than 10 o'clock on April 9, in sealed envelopes, marked "Tender for Oils and Paint," and addressed to James M'G. Jack, clerk 25, Waterloo Place, Edinburgh.

April 10. Portsmouth.—*Supply of the following materials, for the Corporation:—Ballast, sand and grit; Portland cement; brooms and brushes; timber, &c.; and engine-room stores and general ironmongery.* The specification and printed form of tender with regard to each of the above items may be obtained at the Town Hall. Fair wages clause. Sealed tenders on the prescribed form, endorsed "Tender for —," are to be delivered to Alexander Hellard, town clerk, Town Hall, Portsmouth, not later than 10 a.m. on April 10.

April 11. Stoke-upon-Trent.—*Stores for the gas committee.* Particulars and form of tender may be obtained on application at the Gas Offices. Tenders to be sent in addressed to F. Geen, chairman of the Gas Committee, not later than April 11, sealed and endorsed "Tender for Stores."

April 12. Maidstone.—*Furniture and equipment, for the two new patients' blocks at the Kent County Lunatic Asylum, Barming Heath, near Maidstone.* Drawings, specifications and schedules may be seen at the office of W. J. Jennings, architect, 4, St. Margaret's Street, Canterbury, where copies of specifications and schedules may be obtained on depositing with him the sum of £5. Tenders in the form prescribed in the schedules are to be delivered to Francis R. Howlett, clerk to the Kent County Asylums Committee, 9, King Street, Maidstone, not later than 10 a.m. on April 12.

Builders' Notes.

Building Trade Inspectors.—The March report of the United Builders' Labourers' Union states that the society has received a communication from the Home Office asking for their views on the question of building trade inspection. This necessary reform, it is hoped, is now within measurable distance of accomplishment.

Evading the Fair Contract Clause.—The workmen in the contracting trades at Bradford have persuaded themselves and the local trades council that they have a serious grievance in the shape of systematic boycotting of some old men by the masters, and evasion of the fair contracts clause. Under the auspices of the Bradford Trades Council a special conference of building trade employees was held on Friday night last, when it was determined to form a vigilance committee to get up details of cases of the kind suggested and to bring the matter to the attention of the city council through the socialist and labour members of the body. 8½

Limmer Asphalte Paving Co.—At the annual general meeting of this company Mr. H. Holloway remarked that the turnover for the past year had been a record one. The bonus of 5 per cent., which for some years had been paid in addition to the 10 per cent. dividend, was not, however, to be paid, because of the recent increase in capital. Previously the capital was small and the profits correspondingly large, and the directors considered that it would be an advantage to all concerned if instead of a small capital and high dividend they had an enlarged capital upon which a moderate return was made. Despite the excessive competition and the increase in the share capital from £30,000 to £50,000, the profits admitted of the payment of a dividend of 10 per cent., at the same time adding £1,000 to the reserve and carrying forward £2,000 to the next account.

The Annual Dinner of the Norwich and District Master Builders' Association was held last week, the chair being occupied by the newly-elected president, Mr. John Hurn. In giving the toast of "The Association," Mr. R. Jewson said it was with dismay and surprise that he read the decision of the town council last December to take upon itself a large contract which, in his opinion, was legitimately the work of one of the master builders of the city. He did not think the council could justify that decision on the score of efficiency. Although they were all proud of the city engineer, yet, with his multitudinous duties, he could hardly look after a large contract more efficiently than some of the members of the Master Builders' Association. The reason the contract was undertaken by the council was because they wished to find some work for the unemployed. He did not know what the inference was. He supposed the building was going to be erected by the expenditure of a certain amount of labour, whereas it was apparently thought that the master builders would erect it by machinery. He could not see any difference between giving the master builders a chance to put on unemployed labour, or leaving it to the city engineer to do so. At any rate the effect seemed to be that the deserving labour had possibly to be thrown on to the unemployed, while those workmen who were perhaps not quite so deserving were given employment by the city engineer. They did not wish to pass a vote of censure upon the town council, but he suggested to the master builders that the time had come when they should have a representative of their own on the council to state their views irrespective of party politics.

The National Engineering and General Trades' Exhibition is to be held at Bingley Hall, Birmingham, from to-morrow, March 29th, to June 9th next. This exhibition will be of the same character as previous exhibitions held under the same management, the last having been in 1904.

Building Trades Conciliation Board.—The Northern Centre of the Building Trades' Conciliation Boards, embracing Lancashire, Yorkshire, Cheshire and the other counties in the North of England, recently met at Leeds. At present this centre consists of twelve employers and two members from six trade-union societies, the latter number being composed of three joiners, two bricklayers and one mason. So far the plumbers and plasterers are outside the organization, but they are expected at no distant date to be included. Mr. Wilson, of Middlesbrough, was appointed president, and Messrs. Tomlinson (Preston) and Gould (Hull) joint secretaries. The annual meeting will be held in May. The local conciliation board is expected to meet shortly.

Tenders.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, Great New Street, Fetter Lane, E.C. Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Builders' Current Price List of Specialities.

WE have received numerous letters and verbal suggestions from readers pointing out the various difficulties they experience in ascertaining the cost of the many specialities employed in buildings. Their requirements range themselves under the following heads:—

- (1) A record of fluctuations in the price of specialities to be published more frequently than the yearly builders' price-books.
- (2) A list of new specialities with registered names which give no indication of their makers or agents, as well as of older goods still on the market.
- (3) A price list of new materials and goods which will serve to place such goods prominently before the attention of architects and contractors.
- (4) More direct means of inter-communication between buyer and seller.

Architects when preparing drawings and writing specifications require to know what goods are available, and their cost, while builders often have to prepare estimates hurriedly, without sufficient time to write for quotations. Estimating then becomes guesswork, and a contractor often learns his tender is out of the running, or else learns after he has obtained a contract that he is bound to lose on certain items.

Yearly price-books have been published with the idea of offering a ready means of consultation for estimating purposes. These are no doubt valuable for roughly approximating prices of goods, but are quite unreliable for practical estimating, because the prices of specialities fluctuate so quickly.

We believe this list will meet these requirements. Our space is restricted, but in future numbers the list will be enlarged and the prices of other goods substituted,

so that by keeping these special monthly issues of "The Contractors' Supplement" contractors and other purchasers will have ready to hand an accurate compendium of prices for quick consultation.

We shall be glad to receive from readers suggestions as to any improvements and additions to this list of prices which would render it of still greater service to the architectural profession and the building trade.

This list is not intended to promote under-cutting, and prices are subject to discounts for a quantity and for cash. Readers are advised to write for these. Where prices for goods are standardised and fluctuation takes place in trade discounts, our prices have the discounts deducted. In some cases it is difficult for firms to quote prices, and we have stated where they will be pleased to send catalogues and quotations immediately on application.

Fans, Blowers, and Motors.	Belt, electric or steam driven.	Matthews & Yates, Ltd.	Cyclone Works, Swinton, Manchester.	all sizes	—	—	Prices on application.		
Felt:									
Ruberoid Sacking Felt	High-grade inodorous felt	Robert W. Blackwell & Co., Ltd.	59, City Road, London, E.C.	36 x 72	44lbs.	roll,	—	—	13s. 6d.
Fencing:									
Iron	"Greenhill" patent automatic railing.	Hill & Smith	Brierley Hill Iron Works, Staffs.	3½ ft. high ¾ verticals.	40lbs. yd.	24sq. yds. yard	4s. 5d.	4s. 9d.	—
Fireproofing (See also Partitions):									
Terrawode Brickwood Columbian	Fireproof floors	Jabez Thompson & Sons	Northwich, Cheshire	4ins. thick	—	sq. yd.	6s.	7s.	—
Steel Sheeting	Reinforced concrete floors and roofs.	Columbian Fireproofing Co.	37, King William Street, London.	—	—	—	Prices on application.		
Expanded Steel	For partitions, reinforced concrete, damp course, &c.	The Fireproof Co., Ltd.	10, York Buildings, Adelphi, W.C.	all sizes	all weights.	sq. yard	from 1s. 3d.	from 1s. 3d.	plus rail charge
Floors and Roofs	Reinforcement for every description of concrete work.	New Expanded Metal Co.	York Mansion, York Street, Westminster, S.W.	up to 16ft. x 8ft.	2lbs. to 30lbs.	sq. yard	5d. to 4s. 9d.	Price list on application.	
Floors and Roofs	Steel concrete	Homan & Rodgers	17, Gracechurch Street	—	—	sq. yd.	—	—	7s. 9
Floors and Roofs	Reinforced concrete	Trussed Concrete Steel Co.	11, Tothill Street, London	—	—	sq. yd.	—	—	8s. 8
Floors and Roofs	Reinforced concrete	Potter & Co., Ltd.	66, Victoria Street, London, S.W.	—	—	sq. yard	—	—	6s. and up- wards.*
Floors:									
Columbian	Concrete fireproof floors and roofs.	Columbian Fireproofing Co.	37, King William Street, London.	—	—	—	Prices on application.		
Euboelith	Patent flooring	Euboelith Patent Flooring	3, Victoria Street, Westminster, S.W.	—	—	yard sup.	5s. to 6s.	—	—
Galvanised Iron:									
Sheets	Corrugated	Baldwins, Ltd.	5, Fenchurch St., London, E.C.	5ft. to 9ft. x 2ft. x 22 or 24 G.	—	ton	—	£14 10s.	—
Sheets	Flat	Baldwins, Ltd.	5, Fenchurch St., London, E.C.	72 x 24 to 36 x 20 or 24 G.	—	ton	—	£15	—
Buildings	Of every description	Baldwins, Ltd.	5, Fenchurch St., London, E.C.	—	—	—	Prices on application.		
Gas Generators:									
Acetylene	Five-light portable	Strode & Co.	48, Osnaburgh Street, London.	15ins. diameter, 24ins. high.	—	each	—	£3	—
Glass:									
Stained	Memorial and other windows	E. E. Oldacre & Co.	Stirling Place, Hove	—	—	ft. super.	Prices on application.		
Guards, Wire:									
Straight Lattice	Half mesh	Richard Johnson, Clapham, & Morris, Ltd.	Manchester	6ft. x 3ft.	14lbs.	sq. ft.	5d.	5½d.	5½d.
Hooks:									
Hat and Coat	"Schola" pattern for schools, &c.	Brookes & Co., Ltd.	4, Cateaton Street, Manchester.	—	—	—	Prices on application.		
Joinery:									
Panelling	High class r-in. Austrian oak panelling.	Elliott's Moulding & Joinery Co., Ltd.	Newbury	3ft. to 7ft. high.	—	ft. super.	2s.	2s. 1d.	—
Joists:									
Steel	Broad flange beams	H. J. Skelton & Co.	71, Finsbury Pavement, London, E.C.	—	—	ton	—	£6 10s.	—
Steel	English and foreign	Columbian Fireproofing Co.	37, King William Street, London.	—	—	—	Prices on application.		
Steel	Belgian and German	Measures Bros., Ltd.	53B, Southwark Street, London, S.E.	3 to 20 deep.	—	ton	£6 10s. basis sections, £20 to £110.	£6 10s. basis sections, £20 15s. to £112 10s.	—
Laundry Machinery:									
Washing Machines	Improved rotary	W. Summerscales, Ltd.	Keighley, Yorks	many sizes	—	—	—	—	—
Lavatories:									
Glazed Ware	For schools, workmen, and private houses.	Adamsez, Ltd.	Scotswood-on-Tyne	—	—	set, with fittings.	£1 10s. to £4.	—	—
Leaded Lights									
Lights	All descriptions	E. E. Oldacre & Co.	Stirling Place, Hove	—	—	ft. super.	Prices on application.		
Hand-power	All kinds, for all purposes	George Johnson	227, St. John's Hill, London, S.W.	—	—	—	Prices on application.		
"The Premier"	Dinner and service lift to raise ½ cwt.	The Lift and Hoist Co.	Premier Iron Works, Prince Street, Deptford, S.E.	Cage inside 2ft. wide, 1 ft. 6 deep. 2 ft. 6 high. ¾ x ¾ and upwards.	—	—	—	£9 10s.	—
Lightning Conductors									
Copper tape	—	Joseph Lewis	5 & 6, Great Winchester Street, London, E.C.	—	—	foot run	from 1s.	—	—
Locks:									
Coin Collecting	Bright brass or bronzed	New Century Co.	235, High Holborn, London, W.C.	14ins. x 4½ins. x 1½ins.	—	each	—	—	35s.
Kaye's Patent	Four lever mortice, iron and brass.	Joseph Kaye & Sons, Ltd.	93, High Holborn, London, W.C.	—	—	each	—	—	7s. 6d. 10s. 6d.
"C. and B."	Registered mortise Nos. 1, 2, and 3.	Colledge & Bridgen	Midland Works, Wolverhampton.	6 inch	—	dozen	—	—	£3 6s. £2 5s. £1 9s.
Mantelpieces:									
White Wood	With overmantel	The Hardware Trading Co.	12, New Oxford Street, London, W.C.	Opening 38 x 38.	72ins.	each	£2	—	—
Marble, Mosaic, and Stone Work:									
Glass Mosaic	Coloured art	The Cloisonné Glass Co.	40, Berners Street, W.	—	—	sq. ft.	—	From 3s. upwards.	—
	Plain or to design	J. & H. Patteson	7, Bayley Street, Bedford Square, London, and Oxford Street, Manchester.	—	—	—	Prices on application.		
Motor Wagons									
Steam	—	St. Pancras Ironworks Co., Ltd.	171, St. Pancras Road, London, N.W.	—	4 tons 19cwt.	each	—	From £530.	—
Paint:									
"Japonika," Enamel	Elastic, impervious, covers goyds. sup. per gal.	John Line & Sons, Ltd.	Alfred Place, Tottenham Court Rd., London, W.C.	—	—	gallon	18s.	—	—
Anti-corrosive, &c.	"Bitumastic" solution and enamel.	Wailles, Dove & Co., Ltd.	Newcastle-on-Tyne, London, Liverpool, Cardiff, Birmingham, and Glasgow.	—	—	—	Prices on application.		
Partitions:									
Dovetail Corrugated Steel Sheeting.	For partitions, reinforced concrete, &c.	The Fireproof Co., Ltd.	10, York Buildings, Adelphi, W.C.	All sizes	All weights.	sq. yard	From 1s. 3d.	From 1s. 3d.	rs. 3d. plus rail.
Partitions	"Kulm" slabs	H. W. Cullum & Co.	Craven House, Kingsway, London, S.W.	—	—	sq. yard	Prices on application.		
Patent Plaster	Hollow interlocking blocks	Havelock Patent Plaster Partition Co.	63, Finsbury Pavement, E.C.	29 x 17	70lbs. super. yard.	super. yard.	3s. 6d.	4s. 6d.	6s.*
Plaster	Partition slabs	Jabez Thompson & Sons	Northwich, Cheshire	12 x 12 x 2	—	sq. yard	3s. 6d.	4s.	—
Porous Brick	Porous terra-cotta blocks	Hempstead Patent Brick Co.	Nemel Hempstead	9 x 12 x 1½	—	sq. yard	2s.	2s. 4d.	—
Terrawode Brickwood School	Partition bricks	Jabez Thompson & Sons	Northwich, Cheshire	9 x 4½ x 3	2 tons	1000 sq. ft.	£3 5s.	£4 9s.	—
	—	John Stones	"Rosside," Ulverston	—	—	—	Prices on application.

The Question of the Moment. A SPECIAL general meeting of the Royal Institute of British Architects was held last night to consider the report and recommendations of the Registration Committee; but owing to the exigencies of publication we are unable to give the result of that meeting in the present issue. We can, however, deal with the report of the Committee, who, as the result of their deliberations and the evidence given by twenty-four architects from various parts of the kingdom, record that they are impressed with the desire of many architects, especially those who are practising in the provinces, that a legal status should be secured for duly qualified practitioners in architecture. They are of opinion that this can be met by applying to Parliament for a legal diploma of membership of the Royal Institute, it being made compulsory that after, say, 1912 all architects before receiving this diploma must have passed through a definite course of architectural education in a recognized school. The Committee state—as we have said on other occasions—that unless the profession can approach Parliament with approximate unanimity there is little chance of such a measure being passed. They recommend, therefore, that at present the Institute should confine itself to attempting to obtain Parliamentary recognition for its membership instead of supporting the present draft Bill before Parliament. If such State recognition were obtained the temporary necessity of granting a statutory title to unqualified men would be avoided. The *modus operandi* which the Committee propose is that the title of the Institute should be changed to “The Royal College of Archi-

itects,” and that a temporary “third-class” of professional members should be established, these members to be called licentiates, who would be required to pay a small fee. Members of societies of architects found eligible by the council would be admitted as licentiates without election. All admission to this class would be closed within a year after the passing of the Act, and everyone would have to sign a declaration and obligation as to professional conduct. The affixes F.R.I.B.A., and A.R.I.B.A. would be changed to F.R.C.A. and A.R.C.A., while the licentiates would use L.R.C.A. These three classes would be defined as professional members. The Bill, it is proposed, should enact that the present charters and the aforesaid titles should be given statutory force, the scale of charges legalized, and municipalities and other public bodies required to employ a professional member. We need not repeat the names of the committee, nor those of the twenty-four representative architects. It is clear, however, that after all the report has been arrived at in a very one-sided manner. The members of the committee were mostly members of the Institute, and the representative architects were leading practitioners or men of artistic eminence. The smaller practitioner was not represented, and though it may be well enough for the Institute to decide that all architects to be registered who are not members of that body shall be placed in an inferior rank to their own members by giving them the title of licentiate, we doubt if Parliament would endorse this favouritism. If architects are to be registered by the State there must be no differentiation. The proposals still leave the matter somewhat in doubt in reference to the knowledge which shall be required of future architects in order to enable them to be licensed by the State. The opponents of the present proposals argue that though examinations might fairly test a man's constructive knowledge, they could not fix a standard in art. The suggestion that architects before receiving a diploma should have passed through a definite course of architectural education in a recognized school does not meet the argument squarely. That an architect must be trained needs no proof, but that he should be compelled to pass through a recognized school seems arbitrary and a restriction on originality. Besides, it may not always be possible for a student to attend a school for training, though he may be able to obtain quite as good instruction, if not better, from other sources. In fact, there is no reason why he should not educate himself from books and the study of existing buildings and those in course of construction. We fully agree with the proposal to admit to registration without examination students who have passed through a school, but we think that there should be afforded an opportunity, by an examination sufficiently elastic to

weaken as much as possible the inherent defects of the examination system, for the chance student to prove his qualifications for entering the profession of architecture.

A Call for Tudor. WHIPPING a dead horse is proverbially useless, but the whipper's excuse might be that he did not know the horse was dead. We are in somewhat the same position with regard to some recent remarks of that usually well-informed new daily paper “The Tribune.” The remarks in question were contained in an article on “The Aldwych Site.” It was deplored that we were to be supplied with a Renaissance building, in a foreign style—French Renaissance to wit. The writer demanded a building in Tudor Gothic! The argument advanced was that this style was English whereas classic architecture was a horrid importation from Italy. When challenged by a correspondent, the editor of the paper stated that his contention was “that national interest in architecture died with the introduction of the foreign ideas, and, this being so, it would seem that the best hope of reviving that interest lies in picking up that form of later Gothic which is applicable to the needs of modern life and developing from that.” It just happens that late Gothic is as dead as a door-nail, and the thread cannot be picked up. Architects of great learning and ability have tried and failed. Renaissance is the only style in which there is any life to-day apart from the tradition we are building up in domestic work. Even in church work Gothic is lifeless, and is only awakened by the introduction of Renaissance thought. Modern industry, modern thought and modern methods are antagonistic to the Gothic spirit. French Renaissance is a wide term, embracing very dissimilar elements. Modern French Renaissance is, however, closely allied to English work. We are becoming more and more cosmopolitan, and when our students investigate the same examples of past architecture with the education and outlook that now differs so very little in all civilized nations, can we expect to see such different results? The architectural profession sees no danger in the suggested treatment of the Aldwych site, and would infinitely prefer it to the absurdity of a Tudor building in direct association with Somerset House and the two fine Renaissance churches in the Strand.

Our Contract List. A FEW weeks ago, our readers will remember, we revised our list of Contracts Open, publishing it in much more extended form, with particulars of each contract, instead of in abridged table form, as hitherto. Imitation is said to be the sincerest form of flattery, and we therefore acknowledge the compliment which our esteemed contemporary “The Builder” pays us in its issue for Friday last, wherein the same form is followed as that in our pages.

REINFORCED CONCRETE.

(All rights reserved.)

IN our issue for March 14th we gave an extract from a paper read by Mr. William Blackadder, B.Sc., C.E., Harbour Engineer's Office, Aberdeen, before the Association of Civil Engineers, Aberdeen, entitled "Reinforced Concrete Beams: Theory and Experiment." This extract dealt with experiments made by the writer, and gave a full description of the machine designed to conveniently break the beams, and also to give accurate results. It is proposed here to deal with the first portion of the paper.

At the commencement a short account was given of the gradual growth of this type of construction; examples of a few systems now in use, working drawings of actual structures, and lantern views of some during construction being shown.

Several methods of calculation of the strength of beams were gone into, that more fully developed being the method described by Considère in his treatise, "Experimental Researches in Reinforced Concrete." It is unnecessary here to repeat an account of Considère's experiments as to how he determined the strength of the concrete, the adhesion of the steel and concrete, the ratio of the modulus of elasticity of concrete in tension and compression and their ratio to that of steel, the stress-strain diagram of concrete in compression which he adopts as a "straight-line diagram" in preference to the "parabolic diagram," and especially the behaviour of concrete in tension when reinforced as regards its extensibility and corresponding stress. We will assume the fundamental results of these experiments, reproduce his theory of calculation, apply it to some cases, and show some interesting results proceeding from the application of this theory.

Absolute accuracy cannot be obtained in engineering calculations, but the engineer will always desire that the proportioning of his structures should if possible be based on some sound and scientific principle, guided by his practical judgment, in preference to relying on purely empirical formulæ. Cases occur where the latter method is necessary, for sometimes no theory can cover the many changing conditions which occur in practice; but it is satisfactory to know that many designers of this class of work use methods of calculation similar to that developed here, the chief difference being the adoption of the parabolic stress-strain diagram for the concrete in compression in preference to the straight-line diagram as recommended by Considère.

Fundamental Equations.

Adopting the stress-strain diagram as in Fig. 1 and section of beams as in Fig. 2, with dimensions as there shown, we can find the moment of resistance of the section, thus:—Let c , t and f = maximum intensity of stress on the concrete in compression and tension and on the reinforcement; c , r and r = total stress on the concrete in compression and tension and on the reinforcement; p = ratio of area of reinforcement to area of cross-section of the beam; E_c = modulus of elasticity of concrete in compression = k , E_s = modulus of elasticity of reinforcement. Then, since strain is proportional to the distance from the neutral axis, and stress is proportional to strain and the modulus of elasticity,

$$\frac{c}{kf} = \frac{1-x}{x-u} \quad \dots (1)$$

Since total compression above the neutral axis equals total tension below it,

$$\frac{c(1-x)}{2} = tx + fp,$$

and in terms of c and t this becomes from (1)

$$\frac{c(1-x)}{2} = tx + \frac{cp}{k} \cdot \frac{x-u}{1-x} \quad \dots (2)$$

and similarly in terms of f and t we have from (1)

$$\frac{kf}{2} \cdot \frac{(1-x)}{x-u} = tx + fp \quad \dots (2')$$

Either (2) or (2)' is used according as we know c or f .

The moment of resistance is found from Fig. 1 by taking moments about the point o , and, in terms of c and t , is given by

$$M = bd^2 \left(tx \frac{4-x}{6} + \frac{cp}{k} \cdot \frac{x-u}{1-x} \cdot \frac{x-3u+2}{3} \right) \quad \dots (3)$$

and, in terms of f and t , it is given by—

$$M = bd^2 \left(tx \frac{4-x}{6} + fp \frac{x-3u+2}{3} \right) \quad \dots (3')$$

Equation (3)' is first determined by above method and (3) obtained by substitution of value of f in terms of c from (1).

As before, (3) or (3)' is used according as we know c or f . Equations (3) and (3)' are rather long, but this is not due to the introduction of practically speaking negligible quantities, thus aiming at unwarranted refinement in calculation, but to the fact that we have three different maximum stresses to take into account.

These three fundamental equations, (1), (2) and (2)', (3) and (3)', can now be employed to give curves which enable us to find quickly the size of beam necessary to develop any moment of resistance; for from (3) or (3)' we see that if m = moment of resistance of a beam of unit dimensions, that of a beam of dimension $b \times d$ as in Fig. 2 is given by

$$M = m \cdot bd^2.$$

Thus we need merely to find the moment of resistance of a beam of unit dimensions for varying percentages of reinforcement.

To determine the ultimate strength of a beam we will take $u = \frac{1}{10}$; $\frac{E_c}{E_s} = k = \frac{1}{10}$;

$c = 2,140$ lbs. per sq. in.; $t = 170$ lbs. per sq. in.; $f = 30,000$ lbs. per sq. in.,—the elastic limit being the ultimate strength of the reinforcement (steel) so far as it is of use in this construction. Any variation of these values may be used if desired, but the principle of calculation remains the same.

Fig. 3 represents by the curve the values of m for different percentages of reinforcement, Fig. 4 shows position of the neutral axis, and Fig. 5 gives the corresponding stress on the concrete and reinforcement, the full lines being taken in all cases. The curves are obtained from the three fundamental equations by the following method, and all other cases of similar curves are worked out in the same way:—

With some percentage of reinforcement both reinforcement and concrete will develop at the same time their maximum allowable stresses. Putting $c = 2,140$ and $f = 30,000$ in (1) gives $x = .625$; this value of x in (2) or (2)' gives $p = \frac{0.98}{100}$ or .98 per cent. This is the

point where the bend takes place in the curve. Next putting these values of p and x along with the adopted values of u , k , c , t , and f in (3) or (3)' we find $m = 292.3$ ins.-lbs., which is the value for a unit beam, while that of a beam of dimensions $b \times d$ is $M = 292.3 bd^2$. The stress on the concrete or steel is 2,140 or 30,000 lbs. per sq. in., as in Fig. 5. Of particular interest is the point where the bend takes place; it is termed the "critical" or "economic" percentage. Below this percentage of reinforcement the steel is fully stressed to its maximum value of 30,000 lbs. per sq. in.; above it the concrete is fully stressed to its maximum value of 2,140 lbs. per sq. in. and the steel falls below its maximum value, as shown in Fig. 5. This is natural when we consider that the critical percentage is obtained by putting in just sufficient reinforcement to take full value out of the concrete. Hence, below the critical percentage the steel is fully stressed and the

concrete is below its full value; above it we have matters reversed and the stress on the steel falls more and more as its percentage increases (see Fig. 5), thus being very inefficiently employed, as will be seen in dealing with double reinforcements.

As examples of calculation, if $p = \frac{1}{2}$ per cent., from (2)', $x = .68$, as we know $f = 30,000$ and $t = 170$; this value in (3)' gives $m = 182.4$ ins.-lbs., and finally from (1) $c = 1,650$ lbs. per sq. in.—that is, below its maximum value. We use (2)' and (3)' since we know $f = 30,000$; had we used (2) and (3) with $c = 2,140$ we would have obtained a greater value of m , as c is not so high as 2,140; this greater value being inadmissible since it would entail f having a much higher value than 30,000. And when above the critical percentage—say, $p = 2$ per cent.—from (2), $x = .535$, as now we know $c = 2,140$ and $t = 170$; this value in (3) gives $m = 355.6$ ins.-lbs., and finally from (1) $f = 20,345$ lbs. per sq. in.—that is, below its maximum value.

Effect of Neglecting Tension on Concrete.

It is sometimes proposed that, as the tension strength of concrete is an uncertain and unreliable quantity, it should be neglected in calculations. This may be done by putting $t = 0$ in the fundamental equations. It simplifies the calculation and gives curves of m , position of the neutral axis, and stress on steel and concrete, as shown in dotted lines in Figs. 3, 4 and 5. The critical percentage is now .133; it must rise, since r alone has now to balance c . But from Fig. 3 it is seen that beyond this percentage the strength of the beam so calculated is practically the same as when the tension of the concrete is taken into account. This result is easily explained; for we have introduced into the fundamental equations a mathematical condition and must enquire as to its mathematical effect on the distribution of the forces at the section of the beam.

First, since r alone has now to balance c , the neutral axis clearly must rise. Consider first a case where the percentage of reinforcement is above the critical. See Fig. 6, which is a stress diagram at the section of the beam considered—the stress on the reinforcement

being ab or ac multiplied by $\frac{1}{k}$. The full

line represents the case where $t = 170$, and the dotted line where $t = 0$. The neutral axis rises from o to o' , but, being above the critical percentage, $c = 2,140$ lbs. per sq. in.

in both cases, and f increases from $ab \times \frac{1}{k}$ to $ac \times \frac{1}{k}$. The total compression and tension

at the section decreases, but from the figure it is seen that the lever arm of these two forces increases. The gain of moment of resistance due to this latter circumstance is nearly balanced by the loss due to the first-mentioned, and so it happens that the nett value is not much reduced. Also in this case the total value of the tension below the neutral axis is not reduced by r , since r now increases due to the increase of f . This is not so, however, when we take a case below the critical percentage of .133. The neutral axis again rises (Fig. 7), but f cannot now increase, since it is at its maximum already, and the stress diagram across the section is as shown; that is, c decreases from ab to ac . The lever arm of the forces still increases; but the decrease of the total compression and tension is much greater than in the former case; it now decreases by the whole value of r , since f cannot increase. Hence there is a greater proportionate decrease in the forces of the couple, and it is found that the nett value of m , as compared with taking $t = 170$, is a considerable reduction.

As a numerical example with reinforcement 2 per cent., we find that the neutral axis is .465 in. from the top of the (unit)

Fig. 1

Fig. 2

Fig. 3

Fig. 6

Fig. 7

Fig. 4

Fig. 5

beam, and $f = 20,345$ lbs. per sq. in. Hence

$$c = \text{rin.} \times .465\text{in.} \times \frac{2140}{2} = 497.8 \text{ lbs.,}$$

$$T = \text{rin.} \times .535\text{in.} \times 170 = 90.9 \text{ lbs.,}$$

$$F = \frac{2}{100} \times 20345 = 406.9 \text{ lbs.,}$$

$$\text{and } T + F = 497.8 \text{ lbs.}$$

And when $t = 0$ the neutral axis is .435in. from the top of the (unit) beam, and $f = 23,372$ lbs. per sq. in.; hence

$$c = \text{rin.} \times .435\text{in.} \times \frac{2140}{2} = 465.45 \text{ lbs.,}$$

$$F = \frac{2}{100} \times 23272 = 465.44 \text{ lbs.,}$$

that is, a decrease of 32.35 lbs.; but the lever arm (as regards c and F) increases from .745in. to .755in.

Taking moments about a point in the line of c , we have for the moment of resistance in the first case—

From reinforcement

$$m = 406.9 \times .745\text{in.} = 303.14$$

From concrete in tension

$$m = 90.9 \times .577\text{in.} = 52.45$$

$$\text{Total} = 355.59 \text{ ins.-lbs.}$$

And similarly in the second case—

From the reinforcement

$$m = 465.44 \times .755 = 351.41 \text{ ins.-lbs.}$$

If now we take a case below the critical percentages at, say, $p = \frac{1}{2}$ per cent., we would have the neutral axis .32in. from the top of the (unit) beam, and $c = 1,650$ lbs. per sq. in.

$$\text{Hence } c = \text{rin.} \times .32\text{in.} \times \frac{1650}{2} = 264 \text{ lbs.}$$

$$T = \text{rin.} \times .68\text{in.} \times 170 = 115 \text{ ,,}$$

$$F = \frac{1}{200} \times 30000 = 150 \text{ ,,}$$

$$265 \text{ lbs.}$$

When $t = 0$ the neutral axis is .254ins. from the top of the (unit) beam, and $c = 1,180$ lbs. per sq. in.

$$\text{Hence } c = \text{rin.} \times .254\text{in.} \times \frac{1180}{2} = 149.8 \text{ lbs.}$$

$$F = \frac{1}{200} \times 30,000 = 150 \text{ lbs.}$$

The lever arm of c and F has increased from .793in. to .815in., a greater increase than before, but the forces of the couple have decreased to a much greater degree; on calculating the moment of resistance we have—

$$m = 150 \times .793\text{in.} + 115 \times .553\text{in.}$$

$$= 182.4 \text{ ins.-lbs.,}$$

and when $t = 0$

$$m = 150 \times .815 = 122.25 \text{ ins.-lbs.}$$

Effect of Variation of the Modulus of Elasticity of the Concrete.

This is a very variable quantity, and we have taken an average value, namely, $\frac{1}{10}$ th that of the steel reinforcement. It is interesting to see the effect a large variation of this has on the calculated strength of a beam. Taking $k = .08$ and .12, and $t = 0$, in both cases we obtain values of m which can be plotted to give a curve similar to that of Fig. 3. The curves are so close to that of Fig. 3 that they cannot well be shown on the same diagram. Taking $k = .08$ as basis, we have increased it to .12, that is, 50 per cent. The greatest difference in the values of m is at about $1\frac{1}{2}$ per cent.; it decreases from 345 to 300, or a difference of 45 in 345. This is only about 13 per cent.—a most satisfactory result, as we cannot, in making concrete, have very great control over its modulus of elasticity. The fact can be explained as in the case of neglecting tension; we have introduced into the calculation a condition which has two compensating effects, and thus the value of m is not much altered as compared with the variation of k . Fig. 6 will again show the change in stress distribution at a section when the value of k rises from .08 to .14, the percentage of reinforcement being above the critical. The full line represents the case where $k = .08$ and, considering the figure as a strain diagram, the strain ab produces enough stress to enable F to balance c . If k rises the modulus of elasticity of the reinforcement decreases relatively to that of the concrete, and the strain will no longer produce sufficient stress to enable F to balance c . Hence the neutral axis must rise to o^1 . Since $c = 2,140$ in both cases the values of r , c and also f have now fallen—even though the strain on the reinforcement has increased. But we have again the increase in the lever arm of the forces of the couple, and as before this compensates in some measure the loss of moment due to the decrease of the forces of the couple. Thus the variation in the value of m will be less than that of k .

Safe Load Curves.

If we decide that the factor of safety on a beam is to be, say, 4 we can construct safe load curves by reducing the ordinates of m in Fig. 3 to one-fourth their value; on the other hand, such curves are sometimes constructed thus. Seeing that concrete is a material very variable in its strength we may take it for a factor of safety of about 4; the steel being a more reliable factor, may be

used with a factor of safety of about 2. Thus we can obtain m curves with $c = 600$, $t = 2.5$, $f = 16,000$. The disadvantages of this method are, first, that the actual factor of safety varies—in this case from $3\frac{1}{4}$ to $3\frac{3}{4}$; and, secondly; that while we know the factors of safety on each material we do not actually know the factor of safety on the beam itself.

If in our calculations we make $t = 0$, we see from equations (2) and (2)' that x is independent of c or f . Below the critical percentage we have for the value of the moment of resistance

$$m = fp \frac{x - 3u + 2}{3}$$

which shows that for a given value of p , m is proportional to f ; so we would have a factor of safety of 2 when the percentage is below the critical of the safe load curve; when above the critical percentage we have

$$m = \frac{cp}{k} \frac{x - u}{1 - x} \frac{x - 3u + 2}{3}$$

and now for a given value of p , m is proportional to c ; hence the factor of safety is 4 when the percentage is above the critical of the ultimate load curve; and between these two critical percentages it will lie between 2 and 4. Calculation with definite stresses and drawing the curves of m so found will clearly illustrate this.

It would seem that, if the ultimate value of m agrees with experiment, it is better to design from this value with a constant factor of safety rather than to construct curves by giving various safe values to c , f and t , and thus having this factor varying according to the percentage of reinforcement and unknown as to its exact value as compared with those chosen on the constituent materials.

Fig. 8

Expanded Metal.

This type of reinforced concrete work is largely used in this country, and it would be interesting to apply the above methods of calculation to it. It is a very efficient type of reinforcement; for when the steel has reached its elastic limit it will not, owing to the larger deformation thereafter, behave as a reinforcement of steel rods—that is, slide through the concrete and so lead to the failure of the beam. Its form prevents any sliding and thus the strength of the steel is used to its ultimate value. The value of f is no longer the elastic limit, but the ultimate strength, which is from 30 to 32 tons per sq. in. We have now to settle on a value of c for this class of work. Many experiments on slabs with this reinforcement have been made, but the breaking loads so found vary to a large extent; this may be due partly to the manner of loading—a case is considered later on—but here average values will be taken. The example below shows how to find the necessary stress intensity on both steel and concrete to develop a moment of resistance equal to the bending moment applied.

In the catalogue of the Expanded Metal Co. the following test on a slab is given:—

Span 3 ft. 6 ins., thickness 3 ins., reinforcement $\frac{7}{32}$ in. by $\frac{3}{32}$ in. by 3 ins. mesh, breaking load (in one case) 12 cwts. per sq. ft.

The bending movement due to this is about 26,400 lbs. on a slab 12 ins. broad.

$$\therefore m = \frac{M}{bd^2} = \frac{26400}{12 \times 3 \times 3} = 244 \text{ ins.-lbs.}$$

Cross-section of beam = 12 ins. \times 3 ins. = 36 sq. ins.

$$\text{Area of steel} = 8 \times \frac{7}{32} \times \frac{3}{32} = \frac{21}{128} \text{ sq. ins.}$$

$$\therefore p = \frac{21}{128 \times 36} = 0.46 \text{ per cent.}$$

Taking $t = 0$ in all calculations from equation (2) or (2')—we can use either equation now since we see from these equations that x is independent of c or f when $t = 0$ —we find for this percentage that $x = .755$.

From equation (3) we have

$$244 = f \times \frac{.46(.755 - .3 + 2)}{100 \times 3}$$

whence $f = 64,800$ lbs. per sq. in., or about 29.0 tons per sq. in., and putting this value in (1) gives $c = 2,420$ lbs. per sq. in. These results are of course with former values of k and u . Subject to our fundamental equation and conditions these are the stresses necessary; and dealing with several tests we find values of c and f which, put in the equations, will give values of m agreeing with the average of these tests. So doing we find we can take $c = 2,800$ and $f = 72,000$ lbs. per sq. in. Values of m can then be calculated and are shown in Fig. 8, and comparing the curve with results of experiments we have Table I. In the average result of experiment the higher values of m in brackets are neglected; for instance, in one case of 0.46 per cent. the value of m rose to 376 by experiment; this involves on calculation the exceedingly high values of $c = 3,720$ lbs. per sq. in. and $f = 44.4$ tons per sq. in. An increase of m so much above the average

Fig. 9.

Fig. 10

would give rise to doubt as to the full weight of the load being freely distributed over the slab, and is considered later on. The critical percentage is also about $\frac{1}{2}$, agreeing well with experiment. In all these cases t is taken as zero, which, as seen, will reduce the calculated value of m below the critical percentage; but in the case of expanded metal, which stretches to the breaking point before giving way, it is doubtful if at that time the tension strength of the concrete has any appreciable value.

TABLE I.

Value of m .			
	Experiment.	Average of experiment.	Curves.
.46 per cent.	232, 303, 303, (376)	279	275
.70 " "	310, 362, 380	340	330
.76 " "	327, 334, 334, 350, (408)	336	338

Perhaps a more convenient method of representing the strength of different gauges of expanded metal in various depths of concrete is that shown in Fig. 9. It shows, for 3 gauges of expanded metal, the moment of resistance of a slab 12 ins. wide and of thickness in the figure. It is easily deducible from Fig. 8; for in a slab 12 ins. by $4\frac{1}{2}$ ins. with expanded metal No. 8 gauge or $\frac{1}{4}$ in. by $\frac{1}{4}$ in. by 3 ins. mesh the concrete is 54 sq. ins. in section; the metal is $\frac{1}{4}$ sq. in., and so $p = 0.46$ per cent. From Fig. 8 $m = 275$, and hence $M = 275 \times bd^2 = 275 \times 12 \times 4\frac{1}{2}^2 = 66,800$ ins.-lbs.

With a thickness of concrete of about 4 ins. this gauge will form the critical percentage of reinforcement, which explains the bend

(scarcely perceptible to this vertical scale) in the curve there; the position of this bend will vary for the different gauges of expanded metal used.

The values of m given in Fig. 8 may be compared with corresponding values deduced from the safe load for various spans and gauges of expanded metal as given in the company's catalogue. This comparison is shown in the accompanying table II. and gives practically the factor of safety of 4 as there stated. For a load of 3 cwts. per sq. ft. on a slab 12 ins. broad we have the results shown.

Modulus of Rupture of Concrete in Compression.

It may be said that in the fixing of values of c and f for the calculation of expanded metal slabs we have fitted in such values as, conforming to our fundamental equations and conditions, will make experiment and calculation agree. This is analogous to the value of f used, for example, in calculation of timber or cast-iron beams in the well-known equation $\frac{f}{y} = \frac{M}{I}$, f being the modulus

of rupture or transverse strength as distinguished from the direct tension or compression strength. The value of c may be called the modulus of rupture of concrete in compression, which would be expected to be higher than the direct compression strength. If it is considered that this may not be the actual stress, but merely one suitable to make experiment and calculation agree, we may dispense with the condition that strain and stress are proportional to the distance from the neutral axis both above and below, and without this limitation we can from equations (2) and (3) determine very early what must be the total stress on the concrete.

However variable the materials forming a beam may be, one absolutely true condition of equilibrium of the forces acting at any section is that the horizontal forces of tension and compression must balance, provided that vertical forces only act on the beam; and a second is that the moment of the couple so formed must equal the moment of the forces on either side of the section—that is, the bending moment. Taking a case where the reinforcement broke, we have, from an experiment of the writer's, $p = 0.70$ per cent. and $m = 380$.

Since the reinforcement broke,

$$F = f \times p = 72,000 \times \frac{.7}{100} = 504 \text{ lbs.}$$

$\therefore c = 504$ lbs. also.

If y = mean distance between c and F (Fig. 10), or the lever arm of the couple, $504y = 380$. $y = .754$ ins.

Taking $u = \frac{1}{10}$ again, $db = .854$ ins.

Though strain and stress are not now proportional to distance from the neutral axis—we have, if we adopt distribution of compression stress as in figure, $\frac{1}{3}ao = 1 - .854 =$ or $ao = .438$ ins.

TABLE II.

Span.	Bending moment.	Strand. Mesh 3 ins.	Concrete.	Area of steel.	Area of concrete.	p .	$m = \frac{M}{bd^2}$.	m (from Fig. 8).	Factor of safety.
Ins.	Ins.-lbs.		Ins.	Sq. ins.	Sq. ins.	Per cent.			
48	8,064	$\frac{3}{16}$ by $\frac{1}{8}$	3	$\frac{3}{16}$	36	.52	74.7	303	4.06
60	12,600	$\frac{3}{16}$ by $\frac{1}{8}$	4	$\frac{3}{16}$	48	.52	65.6	303	4.62
72	18,144	$\frac{3}{16}$ by $\frac{1}{8}$	$4\frac{1}{2}$	$\frac{3}{16}$	54	.58	74.6	312	4.18
84	24,696	$\frac{3}{16}$ by $\frac{1}{8}$	5	$\frac{3}{16}$	60	.52	82.3	303	3.70
96	32,256	$\frac{3}{16}$ by $\frac{1}{8}$	6	$\frac{3}{16}$	72	.52	74.6	303	4.07

TABLE III.

Reinforcement.	m .	db (Fig. 10).	c .	For c .	Remarks.
Percentage.			Lbs. per sq. in.	Lbs.	
0.46	244	.836	1,346	331	$u = \frac{1}{10}$ $f = 72,000$.
0.46	376	.723	—	—	Ditto.
0.70	380	.854	2,302	504	Ditto.
0.70	380	.900	3,173	476	$u = \frac{1}{10}$ $f = 68,000$.
0.76	408	.848	2,400	547	$u = \frac{1}{10}$ $f = 72,000$.
0.76	408	.888	3,070	518	$u = \frac{1}{10}$ $f = 68,000$.

So $\frac{1}{2}c \times .438 = 504$ lbs.
 $c = 2,302$ lbs. per sq. in.

This is less than the rupture value, as the concrete did not fail.

Taking now a case where the expanded metal did not break, we have by an experiment $p = 0.76$ per cent. and $m = 408$. We do not know f , but assuming it at present at 72,000 lbs. per sq. in., and calculating from these data, $c = 2,400$ lbs. per sq. in.; but as f did not reach this value (the reinforcement not breaking) we will assume next $f = 68,000$. We now find $c = 3,070$ lbs. per sq. in., which is more likely nearer the actual stress than the previous value. Treating experiment in this way, we may find values of c and y which cannot be far wrong. These are shown in Table III., and it must be noted that they are most likely not so great as the modulus of rupture, and are on the small side as regards the actual stress, as it is doubtful if the whole area of the reinforcement is at the moment of failure at 32 tons or 72,000 lbs. per sq. in., since the reinforcement tends to break strand by strand and so reduces the average stress; while, as we see, a decrease in f causes a rise in the value of c . If we assume the stress above the neutral axis to vary as the ordinates of a parabola the values of c will be reduced by about 16 per cent.

These values are not for use in the three fundamental equations, since we have, in order to find a more probable value, dispensed with the perhaps too stringent condition that stress is proportional both above and below to the distance from the neutral axis, but they show that the previously adopted value of c is not excessive.

As regards the second line, where $p = 0.46$ per cent. and $m = 376$, this is the case referred to previously; we find $y = 1.13$ and $db = 1.23$, or the lever arm of the couple necessary is greater than the depth of the unit beam; and this is so even though we give a reasonable value to the tensile resistance of the concrete. It is difficult to see how the moment could actually have been applied to the beam; doubtless much of the load was transferred to the side of the span by an interlocking of the load, and so the actual moment would be less than estimated.

(To be concluded.)

Obituary.

Mr. Thomas C. Hay, borough assessor, of Edinburgh, died recently in his sixtieth year.

Mr. John Walker, builder and contractor, of Derby, who died on January 10th last, left estate which has been valued at £11,895 nett.

The new **Ivanhoe Hotel**, at the corner of Bloomsbury Street and Great Russell Street, London, has been completed from designs by Mr. T. Duncan Rhind, A.R.I.B.A., of Edinburgh, the general contractors being Messrs. William Howard & Co., of London. The interior wood finishings were supplied by Messrs. Scott, Morton & Co., of Edinburgh. The hotel comprises twenty suites of rooms and 250 bedrooms. Wood floor covering has been executed by the Lithic Fireproof Flooring Co.

A new **Jewish Synagogue at Stockton** is being erected, in Hartington Road, at a cost of £1,000, from designs by Mr. T. W. T. Richardson, architect. On either side of the vestibule will be men's and women's cloak-rooms, and from the latter a staircase will give access to the gallery, accommodating fifty women. The synagogue will seat seventy-four men. The ark will be built into a recess on the east wall, with the usual platform in front. At the rear of the synagogue will be a classroom.

ARCHITECTURE AT THE GLASGOW INSTITUTE OF FINE ARTS.

THE forty-fifth annual exhibition of the fine arts is now being held in the Institute Galleries in Sauchiehall Street, Glasgow. The architectural works include a number of

Churches.

foremost among which perhaps is that of St. James, Kilmalcolm, by Mr. William Leiper, a dignified composition in the later Gothic style, with a large corner tower and much fine detail. Mr. Alexander Cullen shows two churches—an interior illustrated by a fine drawing, and an exterior with a saddle-backed tower and two doorways which are rather commonplace. The much-vexed cathedral at Iona is shown by Messrs. Honeyman, Keppie & Mackintosh by a splendid drawing from the pen of Mr. Alexander McGibbon. Additions to the Catholic Apostolic Church at Glasgow are exhibited by Messrs. Salmon, Son & Gillespie, in their usual style with original detail; Ruchill U.F. Church, Maryhill, is shown by Mr. N. C. Duff; Bridgeton Baptist Church by Messrs. Miller & Black—a pleasing design in the Perpendicular style; and Messrs. Watson & Salmon the Wesleyan Methodist Halls at Paisley, of good design, and photographs of a church for the same at Girvan.

Other Work.

A new hotel at Arrochar, of which Mr. A. N. Paterson is the architect, is illustrated by three fine photographs; Mr. Paterson also shows in conjunction with Mr. Campbell Douglas the perspective of their design for the rebuilding of King's College Hospital, London. Messrs. Walker & Ramsay are represented by a city hall front, and Messrs. Burnet, Boston & Carruthers by "Redholm"—a residence for the late lord provost of Glasgow. A dainty colour perspective of Martin's Bank, Bromley, Kent, is shown by Mr. Ernest Newton, who also exhibits a house at Wokingham, Berkshire. Mr. H. R. Taylor shows a design for Stirling public library, and Mr. D. Andrew, junr., a new school at Dalmauir which is much above the average of school architecture and distinctly to be preferred to the Scotland Street School of Messrs. Honeyman, Keppie & Mackintosh. Messrs. Watson & Salmon show three photographs of the entrance gateway to Tulliallan Castle—a very interesting piece of architecture.

A large wash drawing is exhibited of a design for a Victoria Memorial in obelisk form by Mr. F. E. E. Schenck. Mr. J. K. Hunter shows a frame of three photographs of a mansion-house in Wigtownshire, in good style, while Mr. J. Austen Laird is represented by three coloured elevations of a Kilmalcolm house. Two perspectives of good colour and appropriate design are shown by Mr. J. C. McKellar of a large house at Troon, and three thoughtful interiors—photographs—by Mr. James A. Morris.

The Pavilion, Dunoon, is shown by Mr. W. Fraser—a fine but somewhat flattering drawing, and the Pavilion at Ayr by Messrs. Babbie, Bonn & Hamilton Scott.

Messrs. Leadbetter & Fairley show their addition to Edinburgh University, the Usher Institute, in a wash drawing of a pleasing design, and also their reconstruction of "Carling," Ayrshire; while Messrs. Gardner & Miller exhibit two houses, one in South Africa. These exhibits and also the house at Polmont by Mr. J. C. Reid, and the double villa at Troon by Mr. G. Galloway, are distinctly encouraging examples from younger Glasgow firms.

The exhibition is well worth a visit, and might be still more so if Glasgow architects were to unite in making it a record of the year's work, if not also a forecast of the years to come.

Enquiries Answered.

The querist's name and address must always be given, not necessarily for publication.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Correspondents are particularly requested to be as brief as possible.

Reinforced Concrete.

EASTBOURNE.—C. D. H. writes: "Kindly explain the meaning of the term 'reinforced concrete.' In your issue for March 14th, p. 138, you refer to certain test beams of concrete reinforced from $\frac{1}{4}$ to $1\frac{1}{2}$ per cent. How reinforced; by what process?"

See article in this issue.

Plaster Slab Partitions.

WOKING.—F. A. writes: "I have erected some partitions with 'Mack' slabs. Before applying the finishing coat of Sirapite and lime putty, the slabs were treated with a weak Portland cement wash to prevent suction. As the work dries the finishing coat blisters and falls from the slabs. Please state the cause of this, and the best way to finish these goods."

The makers, Messrs. J. A. King & Co., state that "the method your correspondent adopted is very largely followed. Another method, however, to stop the suction is to use a wash of size water instead of a Portland cement wash. Certainly something must be at fault if the finishing coat comes out in blisters. We think, however, that we can understand how this has occurred. The lime in the putty must have been of inferior quality. It is a well-known fact that when the lime is not all that it should be, blistering will occur in ordinary plastering, even on brick walls."

Calculating Tee Rafter for Steel Roof.

BUCKS.—PUZZLED writes: "In calculating the strength for Tee iron rafters of an iron trussed rafter roof truss with four bays, 50ft. span and $\frac{1}{2}$ in. rise with an ordinary glazed roof, and allowing 40 lbs. per ft., including wind-pressure, with the formula

$$W = \frac{16s}{1 + \frac{l^2}{ad^3}} = 1500$$

and a factor of safety of 4, the result is $5\frac{3}{4}$ sq. ins. Is this correct? It seems too much. Is the allowance of 40 lbs. sufficient? For a lantern to the above the members for the same work out to such small dimensions that I suppose it is advisable to keep to the size given in examples in text-books, &c."

The sectional area of Tee rafter is stated as $5\frac{3}{4}$ sq. ins. To obtain this area a 5 in. by $4\frac{1}{2}$ in. by $\frac{3}{8}$ in. steel Tee would be required, but as the largest out of ordinary stock is 4 ins. by 5 ins. by $\frac{1}{2}$ in., two unequal angles, each $4\frac{1}{2}$ ins. by $2\frac{1}{2}$ ins. by $\frac{7}{16}$ in., bolted back to back, may be used. Assuming the given rafter to be divided into unsupported lengths of 7 ft., and using the formula given by querist,

$$W = \frac{16s}{1 + \frac{l^2}{ad^3}} = \frac{16 \times 5\frac{3}{4}}{1 + \frac{84^2}{1500 \times 4 \cdot 5^3}}$$

= say 73 tons breaking thrust, or allowing the correspondent's factor of safety of 4 = about 18.2 tons safe thrust on rafter. The allowance of 40 lbs. per sq. ft. on the surface of roof will be sufficient if it is not in an exposed position, but a better allowance is $\frac{1}{2}$ cwt. per ft. super., as this leaves a fair margin for contingencies.

HENRY ADAMS.

Furnace Clinker for Concrete.

LONDON.—B. H. writes: "Is the refuse furnace clinker from gasworks suitable for making concrete to be used in foundations?"
Yes.

Illuminating.

ROTHERHAM.—LUX writes: "Please name a good book to help me in the preparation of illuminated addresses."

"Illuminating," by W. J. Loftie (Blackie & Son, price 6s.), or "A Primer of the Art of Illumination," by F. Delamotte (Crosby, Lockwood & Son, price 6s.).

Smoky Grates.

ABBEY WOOD.—K. writes: "In a house partly surrounded by tall trees on the south-west and north-east I wish to alter the existing old-fashioned open firegrates with hobs, as at all times they smoke a little into the rooms. The smoke is not due to sudden puffs of wind, but to want of draught. What kind of closed grates should I use, and how can I prevent them smoking? At present the chimneys are capped with the ordinary earthenware pots."

We should not favour any particular form of closed grate. You may suit your fancy. We think it important, however, to fix one of the many patent chimney pots which increase the draught; several are advertised in this journal.

Concentrated Load on Fixed Beam.

LAMBETH.—OLD SUBSCRIBER writes: "How can I obtain the bending moments at ends and under weights in the case of a beam fixed at either end, 24ft. span, and having loads of 5 tons at distances of 5ft. from each end?"

This condition of loading is not among any of the published illustrations known to the writer, but the bending moments would appear to be correctly given by the diagrams herewith, where Fig. 1 shows the conditions and Fig. 2 the bending moment diagram.

In the latter the close ordinates indicate tension in upper flange and the open ordinates compression in upper flange, the stresses in the lower flange being reversed. The junctions between the two sets of ordinates show the points of contrary flexure.

HENRY ADAMS.

Coloured Rough-cast.

HALTWHISTLE.—E. H. writes: "What are the ingredients mixed with rough-cast to give it a coloured finish?"

The metallic oxides should be used. The yellow, brown or red ochres, which are oxides or hydrated oxides of iron, are generally employed.

R.I.B.A. Preliminary Examination.

NEWPORT.—W. J. writes: "What books do you advise me to get for studying the different subjects required in the R.I.B.A. preliminary examination?"

See the R.I.B.A. Kalendar, price 2s. 6d. from the offices of the Institute, 9, Conduit Street, W.

Rolled Joist carrying Brick Wall over Part of Span.

BRADFORD.—SHEBOR writes: "A beam with a clear span of 16ft. carries a 9in. brick wall 12ft. high over half its length from one support. Draw a bending moment diagram and a shear stress diagram, and find the reaction at each support: scales $\frac{1}{4}$ in. to 1ft., 100ft.-cwts. to 1in., and 20 cwts. to 1in. Assuming that a rolled steel joist is to be adopted, what strength-modulus of section would be required so that the maximum stress on the outer fibres should not exceed 8 tons per sq. in.?"

The word "strength" in the expression "strength-modulus of section" should be omitted, as it is likely to lead to misunderstanding. The modulus of section is a value depending upon the sectional area and the arrangement of its parts about the neutral axis. The modulus of transverse rupture is a value depending upon the nature of the material, and is sometimes called "extreme fibre stress." The expression "moment of resistance in square inches" in some rolled-joist section books should read "modulus of section." In the section submitted the graphic diagrams will be as shown and the calculations as follows:—Weight of wall $8 \times 12 \times 75 \times 1 = 72$ cwts. Height of

$$\text{parabola} = \frac{WL}{8} \div \frac{72 \times 8}{8} = 72 \text{ cwt.-ft. Depth of triangle} = \frac{wab}{L} = \frac{72 \times 4 \times 12}{16} = 216 \text{ cwt.-ft.}$$

Bending moments as shown in diagram, maximum scaling 162 cwt.-ft. Reactions at supports $= \frac{wa}{L} = \frac{72 \times 14}{16} = 18$ cwts., and $\frac{wb}{L} = \frac{72 \times 12}{16} = 54$ cwts. at wall end. Shear stresses as shown in diagram. For modulus

of section, $\frac{WL}{8} = zC$, but $\frac{WL}{8} = 162 \text{ cwt.-ft.}$

and $c = 8 \text{ tons} = 160 \text{ cwts.}$, whence $z = \frac{162}{160}$

$= 1' 0' 125$ in foot-units, or $1' 0' 125 \times 12 = 12' 15$ modulus in inch-units. A $7 \times 3\frac{1}{2} \times 18$ lb. rolled steel joist has a modulus of 11' 99 units and an $8 \times 4 \times 19$ lb. rolled steel joist has a modulus of 14' 12 units; the latter must therefore be adopted.

HENRY ADAMS.

Concrete Walling.

KETTERING.—H. C. L. writes: "To what extent do concrete walls transmit sound; also, can a 14in. concrete wall built between waling be relied upon to resist the roof thrusts as well as the same thickness of brick walling?"

Yes; in fact it is rather better.

Books on Libraries and Ironwork.

PETERSFIELD.—V. G. writes: "Are there any books dealing with the planning of small libraries?"

See an article by Mr. Maurice B. Adams in "Specification No. 6," price 5s. 9d. post free from our offices.

GLASGOW.—W. B. writes: "Which are the best books to study to become a structural engineer's draughtsman? I am an architectural draughtsman, but desire to learn the structural work. I would like to know how to calculate the weights and stresses on beams, girders, roofs, &c., before I went into a structural engineer's office."

"Practical Designing of Structural Ironwork," by Prof. Henry Adams (price 8s. 6d.), and Birkmore's "Skeleton Construction in Buildings" (price 12s. 6d.). These books can be obtained post free for the prices named from our offices.

Junction of Tiles and Wood Frames.

BLACKETT writes: "What are the most satisfactory and watertight methods of forming the junction between hung tiles and wood frames?"

Several methods are adopted. The tiles are sometimes bedded in cement, but the latter comes slightly away from the frame. The most satisfactory method is to dress lead round the sides of the frame (nailing to the latter) and under the tiles, or "Ruberoid" may be used in the same way. The tiles above the window should be carried out from the face of the wall by tilting pieces so as to project beyond the window frame.

Architectural Employment Abroad.

BURNLEY.—G. A. B. writes: "I am desirous of gaining an appointment abroad (not necessarily the Colonies). I have had over ten years' general experience in the architectural profession, and during the last four years more particularly in the planning and erection of cotton mills. With a view to further experience in the latter, I should like to gain an appointment in America and other European countries where the cotton industry exists. Please give me the names of various American and Continental magazines, and the source where I may gain enlightenment as to the best mode of procedure to gain the end I have in view."

We do not think your prospects of obtaining a situation abroad by advertising in foreign publications are very promising. The only possible chance that we can see of your obtaining work in the planning and erection of cotton mills is to go to America, France, Belgium or Germany and call on architects engaged in this class of buildings with examples of your work. You might, perhaps, try the experiment of advertising in "The American Architect" and "La Construction Moderne" (published in Paris).

R.I.B.A.

Two Papers on Woodcarving.

A MEETING of the Royal Institute of British Architects was held on Monday evening at 9, Conduit Street, W., the chair being occupied by Mr. Leonard Stokes, F.R.I.B.A.

Papers on "Woodcarving" were read by Mr. W. Aumonier and Mr. A. W. Martyn.

Mr. Aumonier's Paper.

Mr. Aumonier confined himself to the essentially practical side of his subject. Dealing with panel work in its relation to architecture, he said that very fine effects could be obtained by a light and shade treatment, putting some parts very low on the ground and keeping others high. Even a bad design might be made to look tolerable by the way the work was "thrown about," while a really fine design might have no interest if carved with no sense of relief or proper variety of surface. Mr. Aumonier said a design should never be too elaborate, though he felt that in these days of a distinct, and to some architects disquieting, revival of the Grinling Gibbons sort of work, one could not ignore altogether the sumptuous effects arrived at by swags, &c., boldly applied to the surface of plain panels.

Architectural decoration might often be improved by giving more thought to the suitable treatment of carved mouldings—for instance, keeping some very delicate in effect, and some much stronger as a whole.

Caps to columns or pilasters should never be overcrowded, but should show the bell plainly, thus revealing the strength of the column, going right up to the abacus.

As to carving generally, Mr. Aumonier deprecated all mechanical means of getting effect. No part of the ground should ever be absolutely smooth like a planed board, and no part of the surface of the carving itself ever robbed of all expression by the brutal use of glass-paper or fish-skin.

Mr. Martyn's Paper.

Mr. Martyn treated his subject from the historical and critical points of view. He briefly sketched the history of woodcarving, deducing that the best work in all periods had been inspired by religious enthusiasm. He emphasized the point that it was the architect who made the carver. The architect must know what he wanted, and must be able to inspire his carver with his requirements. Grinling Gibbons was cited as an example of an artist in wood who, when left to himself, simply became a clever expert with his tools—as witness the altar-piece at St. James's Church, Piccadilly; whereas, on the other hand, much of the same artist's work in St. Paul's Cathedral, though not nearly so well carved nor so dexterous, had control, had architectural harmony, was part of the architecture and, what was more, part of the architect.

Turning to the educational side of his subject, Mr. Martyn said that though real, useful, living knowledge was being given to students at some of the schools of art, we had no central leading authority to found or carry on any given school of carving. The school of Gibbons was created by his personal force in his work, which was lifted right away from its immediate surroundings to a height carving had not reached for two hundred years. Since his time carving had steadily depreciated. We had now to look for some artist to lead us along the line of progress; and if this could not be done alone, it might be achieved by united efforts.

A gold medal might be founded, on the lines of the Royal Gold Medal for Architecture, and presented annually, or even triennially, as an award of merit to the individual who had done something to raise the

standard of his art, be it in mural decoration, stained glass, plasterwork, woodcarving, or any other branch of architectural work; and the recognition should be public, so that the award should carry with it the good opinion of the art-loving public. But the opportunity should be created for continued study; there should be a central school directed by men of knowledge; always remembering that the architect was the master, the carver the servant, though a direct and living sympathy must at all times exist between them if the best results were to be obtained.

Mr. George Hubbard proposed a vote of thanks to the lecturers for the papers they had read, which was seconded by Miss Eleanor Rowe, and supported by Messrs. J. D. Crace, Inigo Triggs, W. H. Atkin Berry and the chairman.

OUR PLATES.

A REVIEW of the competition for the King Edward VII. secondary school to be built at Lytham, on the Lancashire coast, will be found on p. 89 of our issue for February 14th, where a detailed description of the first-, second-, third- and fourth-premiated designs is given. We need not now repeat the particulars, but for the convenience of readers the following facts may be stated:—Lytham possesses a large endowment vested in governors, who decided recently to spend a considerable sum on the erection of a school, designs for which were invited from thirteen architects resident in the North of England—Liverpool, Hull, Manchester and elsewhere. As initial outlay, £22,000 was allotted for the site and £30,000 for the first instalment of buildings. The site faces the sea and has an area of more than thirty acres. It is a very exposed site, subject to storms of wind and sand of great violence, and this fact has largely governed the lay-out of the plan. The conditions required a group of buildings for day scholars, boarders' and headmaster's residence; staff, including masters, matrons and servants; science and lecture rooms; a large hall to seat 700 or 800 persons; workshops for wood, metal, &c.; a large dining hall with kitchen; and a number of other rooms—all ranged around a quadrangle. The successful architects are Messrs. Briggs & Wolstenholme, of Blackburn, to whom the first premium of £250 was awarded by the assessor, Prof. Beresford Pite.

Law Cases.

A "Bad" L.C.C. By-law as regards Mortar.—At Greenwich Police Court last Wednesday Mr. Baggallay dismissed, with fifty guineas costs, a summons by the London County Council against a firm of Lewisham builders, Messrs. H. & G. Taylor, for using mortar not of proper proportions of lime and sand in the erection of some houses in Boyne Road. Mr. Baggallay said the mortar used was composed of 1 of lime to 3 of sand or grit if it were measured with slaked lime; if unslaked the proportion was about 1 to 5. Many builders had treated the by-law on the basis of measuring slaked lime. It was argued that the by-law was bad because no one could understand what it meant. The builders satisfied him that the meaning of the expression "lime" alone might be either slaked or unslaked. The by-law ought to say how the proportions should be taken, and he was inclined to hold that the by-law was bad on that ground. It did not seem to him unreasonable that "lime" might mean slaked lime, and, therefore, he could not hold that the builders had broken the by-law.

Notes and News.

Mr. F. L. Dove is the new president of the Institute of Builders, and Messrs. W. F. Wallis and F. Higgs vice-presidents.

The Works of Sir Christopher Wren were dealt with by Mr. John Swarbrick, A.R.I.B.A., in a paper which he read before the Manchester Society of Architects on March 27th.

Mr. Jesse Horsfall, F.R.I.B.A., of Todmorden and Manchester, has been appointed architect for the proposed new secondary school to be built on the Stile Estate at Todmorden.

Hotels, Ancient and Modern.—A paper on this subject was read on Thursday last at the Auction Mart, Cardiff, before the Cardiff, South Wales and Monmouthshire Architects' Society, by Mr. Ernest Runtz, F.R.I.B.A.

Motor Warehouses at Nos. 132, 133, 134 and 135, Long Acre, W.C., are being erected by Messrs. Patman & Fotheringham, Ltd., of Theobald's Road, W.C., and Park Street, Islington, N. The architect is Mr. William Woodward, F.R.I.B.A.

Stevenage Grammar School.—The new buildings for this school were opened on Wednesday last by Dr. Butler, Master of Trinity College, Cambridge. The architect is Mr. F. T. W. Goldsmith, F.R.I.B.A., of 1, Verulam Buildings, Gray's Inn, W.C., and the builders are Messrs. Willmot & Sons, of Hitchin, Herts.

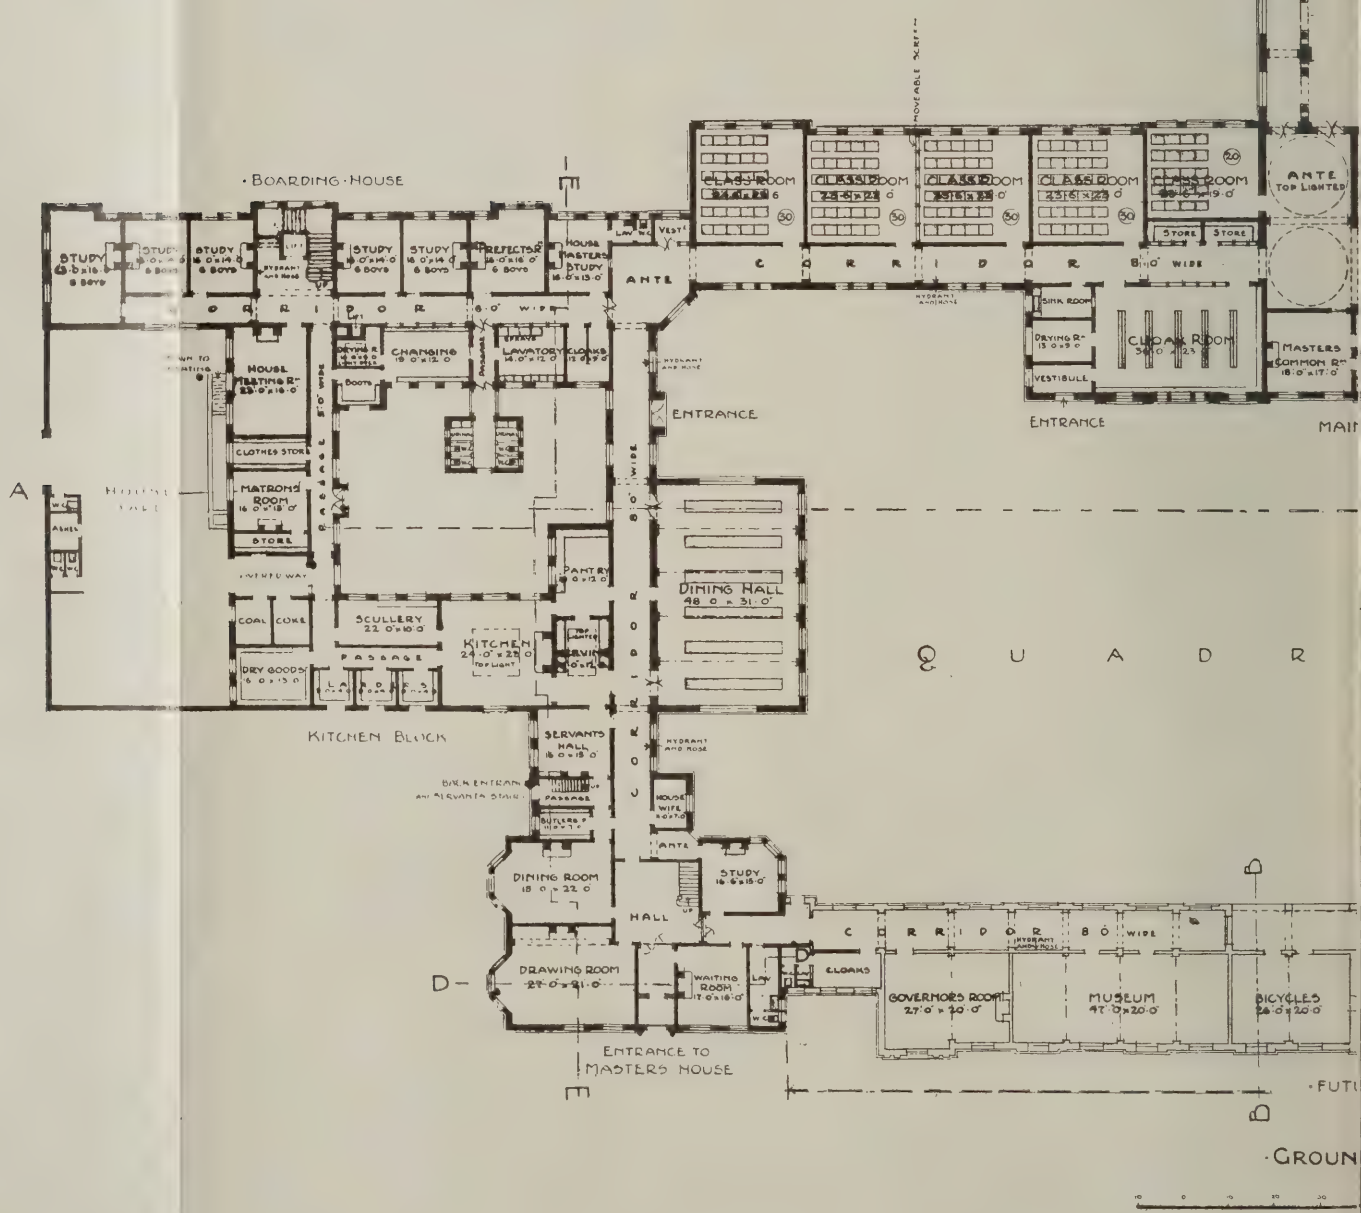

Dissolutions of Partnership.—The partnership which has existed for about five years between Mr. R. S. Balfour and Mr. William A. Pite, F.R.I.B.A., has been dissolved as from February 24th last.—The partnership existing between Mr. Benjamin Gale and Mr. Alfred Gale, carrying on business as carpenters and builders, at 865, Old Kent Road, S.E., has also been dissolved, as and from March 20th.

"British and American Building Methods" were dealt with by Mr. J. Roxburgh Sharman, A.M.I.C.E., before the Edinburgh Architectural Association last week. The remarkable growth of the use of steel construction in this country was referred to, and also how American methods were modifying the older practice of British architects. At the same time Mr. Sharman indicated that the best practice in both countries was coming very much into line. The lecturer also discussed the question of loads, and thought probably a safe and good practice would be found in adopting loads somewhere between the extremes of America and Glasgow—dwelling-houses and tenements, 80lbs. per sq. ft.; theatres and hotels, 100lbs.; halls, schools, churches, &c., 100 lbs.

The Builders' Clerks' Benevolent Institution celebrated its twenty-seventh annual dinner at the Holborn Restaurant, W.C., on Tuesday, March 27th. The function was a most successful one, the attendance numbering between 400 and 500. Mr. Howell J. Williams, L.C.C., the president, was in the chair, and in proposing the toast of the evening referred to the humble beginnings of the Institution, which now required an income of between £700 and £800 to support it. He commended the objects of the Institution to all builders' clerks, who, he understood did not support it as they should. Mr. E. Brooks, in replying, mentioned that the work of the Institution was restricted owing to lack of funds. The invested funds now amounted to £7,000, which he should like to see much increased. During the evening about £500 was collected, this sum including £100 from the chairman, £10 10s. each from the Worshipful Company of Carpenters, the Institute of Builders, Mr. W. Curling Anderson, and Messrs. Trollope & Colls, and £5 5s. from the ex-president, Mr. J. Carmichael.

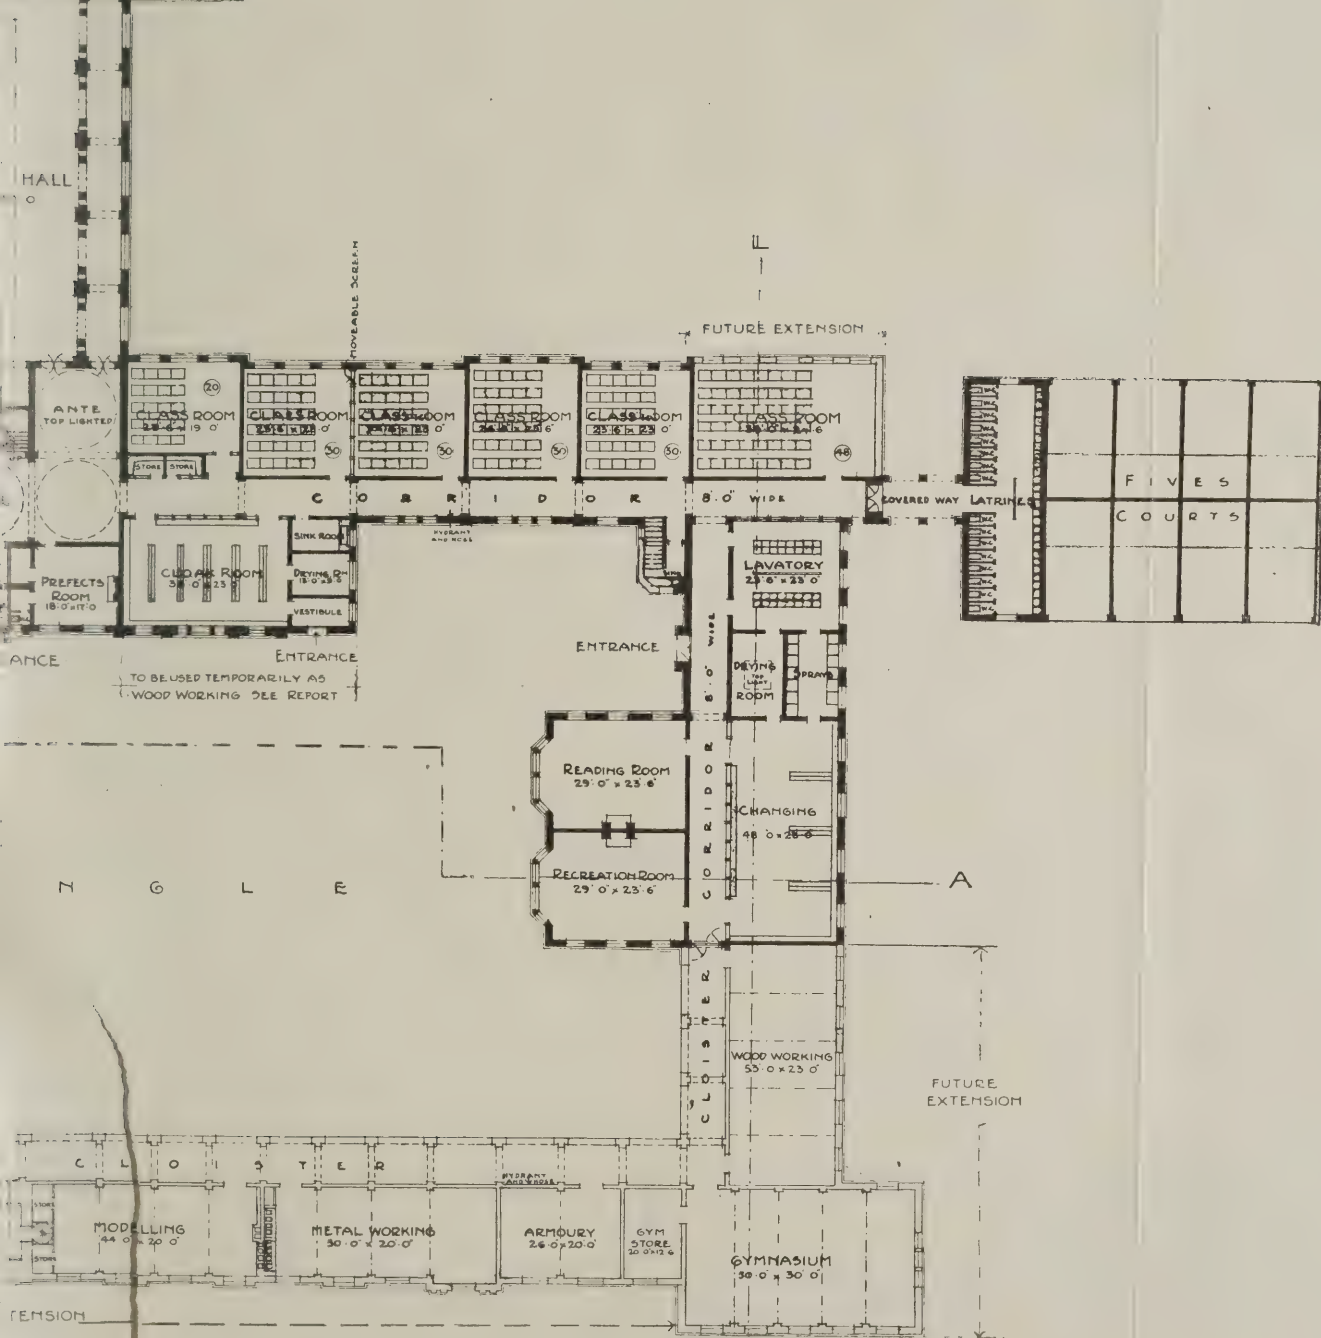

ELEVATION TO CENTRAL HALL AND SCIENCE BLOCK - EAST

KING EDWARD VII. SCHOOL, LYTHAM, LANCs.: FIRST-PREMIATED DESIGN.
BRIGGS AND WOLSTENHOLME, ARCHITECTS.

NOTES ON COMPETITIONS.

A Scottish Competition.

Forty-three designs were submitted in the competition for new buildings of the Institution of Engineers and Shipbuilders in Scotland to be erected at the corner of Elmbank Street and Elmbank Crescent, Glasgow. They were on exhibition in the Wellesley Buildings, Sauchiehall Street, last week. The successful design is No. 16, sent in by Mr. John B. Wilson, architect, of 92, Bath Street, Glasgow.

This competition has been a very successful one. The site is in every way a suitable one. The conditions of competition were very well drawn up, the only condition that might be objected to being that restricting the competition to architects practising in Glasgow. No premium is to be paid to the successful architect Mr. Wilson, but the second design in order of merit by Messrs. Mitchell & Whitelaw is awarded £75, the third by Mr. H. E. Clifford £50, and the fourth by Mr. W. F. McGibbon £25. The accommodation required was a large hall, a small hall, library, reading-room, smoking-room, coffee-room, two council rooms, and several rooms for meetings, secretary's office, &c. It was suggested that the building should not exceed three storeys and basement, that the library, reading-room and secretary's office should be on the ground floor, while the large hall should be on the top floor. These conditions have been fairly well adhered to by the competitors, and several good designs have been sent in besides the premiated ones. The design by Mr. Alex. Cullen is excellent, the elevations being especially fine, and that of Messrs. Honeyman, Keppie & Mackintosh would have made a very fine if somewhat original building. The advising architect was Mr. G. Washington Browne, of Edinburgh, who placed first Messrs. Mitchell & Whitelaw's design. The competition committee, however, have seen fit to change the order of the first and second architects, because of the greater commodiousness of Mr. J. B. Wilson's plan and its greater suitability to their purposes. The building is estimated to cost about £15,500.

The Mitchell Library, Glasgow.

This competition can hardly be said to be so satisfactory as that for the engineers and shipbuilders. After the competition had been won by Mr. William B. White, of Glasgow, he was asked to prepare amended plans, so that the plans which have now been adopted by the Council are, as one of the members stated at the meeting, both internally and externally to the average man new plans altogether. The alterations include the placing of the entrance in the centre of the North Street elevation and the addition of a dome, as shown by the illustration below.

The estimated cost now as approved by the Corporation is £52,850. The accommodation provided includes a main reading hall, 110ft. by 51ft., arranged for 300 readers; a students' room for fifty readers; a ladies' room for fifty readers; a magazine room for 200 readers; and suitable apartments for the Jeffrey Reference Library, for the Glasgow Collec-

tion, and for the Burns Library and Scottish Poets' Corner. Provision is made for the convenient storing of about 400,000 volumes, and for the necessary administrative offices. A considerable space has been left behind the library for future extension of the buildings.

Proposed new Club Rooms for Kirkintilloch Conservative Association.

The conditions just issued for this small competition can hardly be called satisfactory. The proposed rooms are only to cost £1,800, including architects' and measurers' fees, no plan of the site is furnished, nor any premium offered, and, finally, "the Association do not bind themselves to accept any plan."

Bolton School Competition.

The Bolton Town Council held a special meeting recently, when, after prolonged discussion, they decided to throw over the selection made in the competition for a new Council school, for which the design of Messrs. Wright, Garnett & Wright had been accepted by the Education Committee, and also to reject the tender of Mr. H. Fairclough, amounting to £11,418, recommended for acceptance. We shall deal with this affair next week.

Central Library, St. Pancras.

On the selection of Mr. John Belcher, P.R.I.B.A., the Borough Council have invited the following six London architects to submit designs for a new central public library for St. Pancras:—Mr. J. S. Gibson, Messrs. Mallows & Cross, Messrs. Wills & Anderson, Mr. Maurice B. Adams, Mr. Edmund Wimperis, and Messrs. Russell & Cooper.

Edmonton Infirmary.

The following five architects have been invited to submit designs for a new infirmary at Edmonton to accommodate 800 patients—Mr. W. A. Pite, Mr. A. E. Pridmore, Mr. Marcus Collins, Mr. Stuart Hall—these of London—and Mr. W. H. Ward, of Handsworth, Staffs. Each of the competing architects will receive an honorarium of seventy-five guineas. The successful competitor will be paid 5 per cent. on the first £100,000 and 3 per cent. on the remainder, his honorarium to merge in the commission.

Wesleyan Hall and Schools at Lytham.

The design of Mr. Herbert Wade, of Blackpool, and Mr. Walter Wade, of St. Anne's, joint architects, has been selected in competition for the East End Wesleyan Mission Hall and Schools to be built at Lytham at a cost of £2,500.

Baptist Church School, Peterborough.

From four plans submitted for a new Baptist church school to be built in Queen's Road, Peterborough, those by Messrs. Dotteridge & Walford, of Leadenhall Street, London, E.C., have been selected by the congregation.

Competitions Open.

The following is a list of competitions open:—

DATE OF DELIVERY.	COMPETITION.
April 14	SCHOOL AT OSSETT.—Premium of £50 (to merge). Particulars from the Secretary at the Education Office, Ossett.
" 15	PEACE PALACE AT THE HAGUE.—Particulars from the office of the Carnegie Foundation, Noorderinde 33, The Hague.
May 31	NATIONAL CONGRESS HALL FOR BRAZIL.—Premiums of 15,000, 10,000 and 5,000 milreis (equivalent to about £1,685, £1,125 and £562 respectively). 5,000 milreis also for designs not premiated but desirable to be acquired. The conditions of the competition can be seen at the offices of the Commercial Intelligence Branch of the Board of Trade at 73, Basinghall Street, E.C.
No date	ALTERATIONS TO BLOCK OF LONDON BUILDINGS.—Premium of £25. Particulars from Mr. J. H. Batten, 39, Victoria Street, Westminster.

NEW LONDON BUILDINGS.

AT yesterday's meeting of the London County Council the Building Act Committee reported the following applications under the London Building Act, 1894, their recommendations as to consent or refusal being appended in *italics*:—

Extension of the period within which the erection of three houses with one-storey shops in front, on the site of No. 63, Dartmouth Road, Forest Hill, and the erection of additional storeys over the existing shops at Nos. 55 and 55A, Dartmouth Road, were required to be completed, on the application of E. C. Christmas. (*Consent.*)

Greenhouse at the rear of No. 24, Shepherd's Bush Green, Hammersmith, to abut upon Camden Gardens, on the application of G. Stone. (*Consent.*)

Buildings, with projecting one-storey shops, on the eastern side of The Grove, Hammersmith, on the site of Nos. 2 and 2A, on the application of L. V. Hunt, on behalf of F. Britton. (*Consent.*)

Projecting sign in front of No. 11, Long Acre, on the application of Windover, Turrill & Sons. (*Consent.*)

Addition to No. 1, Cochrane Street, St. John's Wood, to abut upon Wellington Place, on the application of Woodrow & Helsdon, on behalf of J. K. Tinson & Son. (*Consent.*)

House with barge-boards on the eastern side of Mount Ephraim Lane, Streatham, to abut upon Norfolk House Road, on the application of Chapple & Utting. (*Consent.*)

Extension of the periods within which the erection of buildings on the east side of Bromley Road and the south side of Sangle Lane, Catford, was required to be commenced and completed. (*Consent.*)

Enclosure of a portion of the portico in front of No. 21, Hill Street, Berkeley Square, on the application of Keeble, Ltd., on behalf of Captain H. S. Clay. (*Refusal.*)

Deviation from the plan approved on April 18th, 1905, for the erection of buildings upon the site of No. 106, Heath Street, Hampstead, so far as relates to an alteration in the height and length of the flank wall abutting upon New End, on the application of J. D. Hunter, on behalf of Miss G. Elsdon. (*Consent.*)

Wooden screen at the rear of Nos. 6 to 10, Garden Place, Aldgate, City, at less than the prescribed distance from the centre of the roadway of Aldgate Avenue, on the application of J. Hood and Sons, on behalf of G. Horwitz. (*Refusal.*)

Retention of an iron and concrete timber drying stage at Tredegar Works, on the south-west side of Ordell Road, Bow, on the application of Perry & Co. (*Consent.*)

Retention of two wood and iron buildings on a site on the western side of Ladimer Road, Hammersmith, on the application of A. Dawkins, on behalf of W. J. Moore. (*Refusal.*)

Extension of the periods within which the erection of buildings between Nos. 65 and 69, South Side, Clapham Common, Clapham, was required to be commenced and completed, on the application of Horner & Lucas. (*Consent.*)

Oriel window in front of No. 88, Goswell Road, Finsbury, on the application of P. B. Tubbs, on behalf of F. Gough. (*Consent.*)

Retention of a greenhouse at the rear of Siebert House, Glenluce Road, Greenwich, abutting upon Westcombe Hill, on the application of E. Mills. (*Consent.*)

Retention of two wooden sheds on a site abutting upon the northern side of Elmer Road and upon the western side of St. Fillan's Road, Catford, on the application of E. Wright, on behalf of M. H. Amey. (*Refusal.*)

Retention of a wood and iron building at the rear of No. 1, Upper Phillimore Place, Kensington, at less than the prescribed distance from the roadway of Phillimore Mews, on the application of W. G. Hunt, on behalf of R. MacMahon. (*Refusal.*)

Buildings to abut upon Regency Street, Chapter Street, Frederick Street and Hide Place, Westminster, on the application of Clutton, on behalf of the Ecclesiastical Commissioners. (*Consent.*)

Modification of the provisions of that section with regard to open spaces about buildings, so far as relates to Nos. 3 and 5, Rushey Green, Catford, with irregular spaces at the rear, on the application of A. L. Guy. (*Consent.*)

Modification of the provisions of that section with regard to open spaces about buildings, so far as relates to the proposed erection of a block of dwellings on the western side of Rupert Street, Whitechapel, on the application of R. W. Hobden, on behalf of Hickman, Ltd. (*Refusal.*)

Deviations from the plans certified by the district surveyor so far as relates to the proposed erection of buildings upon the site of Nos. 28 and 29, Lisle Street, and Nos. 28 and 29, Little Newport Street, Strand, on the application of Philip E. Pilditch. (*Consent.*)

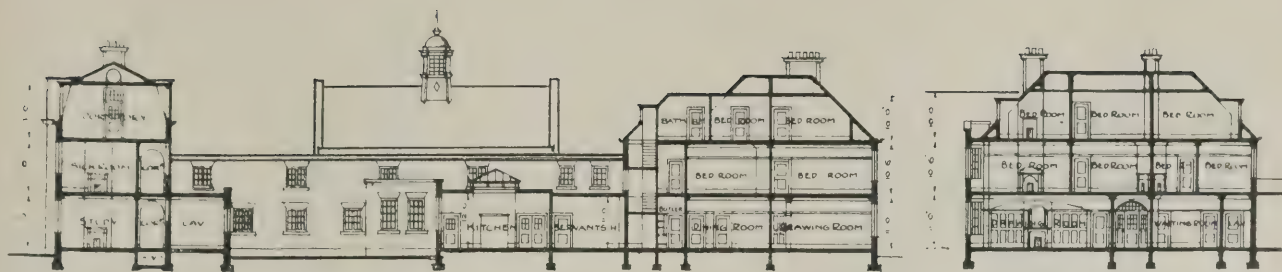

Two-storey workshop buildings upon land at the rear of houses in St. Paul's Road and Elm Road, Camden Town, St. Pancras, and in connection therewith the formation or laying-out of a street, on the application of S. G. Castleman, on behalf of H. G. Regnart. (*Consent.*)

Deviation from the plans approved on August 30th, 1905, for the formation or laying-out of new streets for carriage traffic on the Furzedown Park Estate, Back (or Rectory) Lane, Streatham, so far as relates to an alteration in the gradients of two of the proposed streets, on the application of Milner, Son & White. (*Consent.*)

Building Societies' Deficit.—The Chief Registrar of Friendly Societies reports the liabilities of the building societies of England and Wales at £49,784,070 for the year 1904 and the assets at £49,683,436, showing a deficit of £100,634.

BASEMENT PLAN.

GROUND FLOOR PLAN.

ARTHUR T. GREENWOOD,
ARCHITECT.

Scale: Eight feet to an inch.

This building is now in course of erection. The design was selected in competition in June, 1903, in which sixteen sets of designs were submitted. The builder is Mr. J. T. Harris of High Wycombe, whose contract amounts to £3,229. The total cost is estimated at about £5,000. The school will accommodate 175 students. It is being built of red bricks, with terra-cotta dressings, the roof to be covered with blue Bangor slates. One or two modifications have been made in the above plan (which we are able to reproduce by the courtesy of the "South Bucks Free Press"), the principal alteration being the transposition of the laboratory and conservatory from the western to the eastern end of the building, while the classroom as shown on the east of the plan is removed to the west. The architect is Mr. Arthur T. Greenwood, of Highfield, Gorton, Manchester.

Complete List of Contracts Open.

With a few exceptions, news of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issue of other contracts that still remain open.

Unless expressly stated to the contrary all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair-wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

April 5. Newcastle-on-Tyne.—*Proposed county offices at the Moothall, Newcastle-on-Tyne.* Contractors desirous of tendering for the whole of the works required in the erection of the above offices are requested to send in their names to the undersigned on or before Mar. 19. Bills of quantities will be forwarded after that date on payment of a deposit of £3 3s. Applications to be sent to J. A. Bean, county architect, The Moothall, Newcastle-on-Tyne, where the drawings can be seen. Sealed tenders (sent in the envelopes provided) to be delivered not later than 4 p.m. on April 5.

April 5. St. Ervan.—*Repairs for the Cornwall Education Committee, according to the specification which may be seen at the said schools or at the office of the architect, B. C. Andrew, Biddick's Court, St. Austell.* Forms upon which all tenders must be made may be had from the architect or the secretary. Sealed endorsed tenders to be sent to F. R. Pascoe, secy., Education Office, Truro, by April 5.

April 5. Woodbridge.—*Ventilating and making small alterations to the board-room, for the Guardians.* Plans and specifications of the proposed work may be seen at the office of Brown & Burgess, architects, Arcade Street, Ipswich. Sealed tenders, endorsed "Alterations to Board-room," to be delivered at the board-room not later than 10 a.m. on April 5.

April 5. Portleven.—*Work at the school for the Cornwall Education Committee, according to plans and specifications which may be seen at the schools.* Any further information relating to the work may be obtained from Sampson Hill, architect to the Committee, Green Lane, Redruth. Forms upon which all tenders must be made may be had from the architect or the secretary. Sealed endorsed tenders are to be sent to F. R. Pascoe, secretary, Education Office, Truro, by April 5.

April 5. Pontlottyn.—*Converting present premises into three shops, for M. Morgan, Railway Inn.* Plans and specification can be seen at the Railway Inn or at the office of T. Roderick, architect, Ashbrook House, Aberdare. Endorsed tenders to be sent to M. Morgan not later than April 5.

April 5. St. Albans and Harpenden.—*New waiting-rooms and awnings, for the Midland Railway Co.* Plans and specifications may be seen, quantities and particulars obtained, on application at the Engineer's Office, Derby Station. Sealed tenders to be forwarded by post to the Secretary of the Way and Works Committee, Midland Railway, Derby, not later than 9 a.m. on April 5.

April 5. Ruthrieston.—*New public school for the Aberdeen School Board.* Estimates are invited for executing the carpenter, slater, plasterer, plumber, painter and glazier, blacksmith and electrical engineering works required in connection therewith. Copies of the specifications and schedules of quantities may be had from J. A. O. Allan, the Board's architect and master of works, with whom also the plans and general conditions of contract may be seen. Sealed and marked tenders must be lodged with Thomas Hector, clerk, 22, Union Terrace, Aberdeen, by noon on April 5.

April 6. East Grinstead.—*New works, repairs, painting, decorating and ventilating in connection with the Wesleyan Church.* Specification and further particulars may be obtained on application to H. Criswell, 57, Queen's Road, East Grinstead. Tenders, endorsed "Tender for Painting," to be sent to Rev. J. G. Gill, York House, East Grinstead, not later than 10 a.m. on April 6.

April 6. Chesterfield.—*Alteration and conversion into sale shops of the premises known as the Market Hall Vaults, with adjoining premises, situate in the Market Hall.* Plans and specifications may be inspected and all further information obtained on application at the office of the Borough Surveyor. Sealed tenders, endorsed "Market Hall Vaults Alterations," are to be delivered to J. Middleton, town clerk, Chesterfield, by noon on April 6.

April 6. Kemplar.—*Rebuilding a small bridge a Kemplar, near the village of Dufton, for the East Westmoreland Rural D. Council.* Plans and specifications may be seen at the Surveyor's Office, Kirby Stephen. Sealed tenders, endorsed "Dufton Bridge," must be delivered at the office of William Hewitson, Appleby, the clerk to the said Council (where also plans and specifications may be seen), not later than April 16.

April 6. Boyndie.—*New central school and teacher's house for the School Board.* Plans and specifications to be seen with John McCulloch, clerk to the School Board, Boyndie, and offers, marked "Tender for School Buildings," to be lodged with the clerk of the Board not later than April 6.

April 6. Kimberley.—*Building a bulwark stone boundary wall in Factory Lane, for the Basford R.D.C.* Specifications and particulars may be obtained from G. W. Hanley, highway surveyor, at the Council's Offices, Burton Buildings, Parliament Street, Nottingham, to whom sealed tenders, endorsed "Tenders for Walling," must be sent not later than April 6.

April 7. New Aberdour.—*New dwelling-house.* Estimates are wanted for the mason, carpenter, slater and plasterer works. Plans and specifications to be seen at Joseph Coutts, blacksmith, New Aberdour, to whom tenders for the works may be lodged up to April 7.

April 7. Morley.—*Erection of a jam factory, in Baker Street, Morley, for Metcalfe & Bradshaw.* Plans and specifications may be seen and quantities obtained at the offices of T. A. Buttery and S. B. Birds, Queen Street, Morley, to whom tenders must be sent by noon on April 7.

April 7. Bradford.—*Alterations and renovations to the Old Dolphin Wesleyan Chapel, Clayton Heights, near Bradford.* Plans, &c., may be seen and quantities obtained up to April 7, on application to Sam Spencer, architect, Old Bank Chambers, Great Horton, Bradford.

April 7. Whitley Bay.—*New Congregational church and vestries.* Contractors desirous of tendering for the erection of above (stone building) are requested to send their names to Davidson and Phillipson, architects, Pearl Buildings, Newcastle-on-Tyne, on or before April 7. Bills of quantities will be supplied to such applicants only.

April 7. Holyhead.—*Alterations and additions to the Tabernacle Congregational Chapel, Thomas Street.* Plans and specification may be seen at the offices of J. Owen, architect, at Holyhead and Menai Bridge. Tenders, sealed and endorsed, to be sent to R. J. Jones, Regent House, Holyhead, on or before noon on April 7.

April 7. Stockport.—*First portion of an observation block, at Dialstone Lane Hospital.* The general conditions, specifications, &c., will be supplied by the architect, G. H. Brady, Borough Chambers, St. Petersgate, after Mar. 24, on payment before that date of a deposit of £1 1s. Fair wages clause. Sealed tenders, endorsed "Hospital Building Contract," addressed to the Chairman of the Health Committee, must be delivered to Robert Hyde, town clerk, Town Clerk's Office, Stockport, by noon on April 7.

April 7. Ashill.—*Repairs at the Council School.* Specification and further particulars at the office of Samson & Cottam, architects, Bridgewater. Sealed tenders must reach the County Education Office, Weston-super-Mare, before noon on April 7.

April 7. Puriton.—*New offices and for alterations at the Council School.* Plans, specifications and further information at the office of Samson & Cottam, architects, Bridgewater. Sealed tenders must reach the County Education Office, Weston-super-Mare, before noon on April 7.

April 9. Dartford.—*Enlargement of the county police station, ordered by the Standing Joint Committee.* Plans and specification can be seen and bill of quantities and tender form obtained, on deposit of £2, at the office of the County Architect, 86, Week Street, Maidstone. Sealed tenders, endorsed "Dartford Police Station," are to be delivered to Charles Turner, clerk, Sessions House, Maidstone, by 5 on April 9.

April 9. Dorking.—*Increased accommodation at the Isolation Hospital.* Plans, specification and conditions of contract may be obtained at the office of the architect, W. Shearburn, South Street, Dorking. Quantities will be supplied on a payment of 10s. 6d. to architect. Tenders, marked "Tender for Hospital," to be sent to W. J. Hodges, 35, High Street, Dorking, by April 9.

April 9. Rainford.—*New offices and parish room, for the U.D.C.* Quantities and particulars may be obtained at the office of J. & W. Gandy, Masonic Buildings, St. Helens, on a deposit of £2. Sealed tenders to be sent to B. Smith, clerk to the Council, Rainford, not later than 2 p.m. on April 9.

April 9. Kingston-on-Thames.—*Pulling down of old premises and erection of new offices and workshops for Knapp, Drewett & Sons, Ltd., as follows:*—New premises for the "Surrey Comet" offices, at No. 20, Clarence Street, Kingston-on-Thames; new workshops on land at rear of No. 18, Church Street, Kingston-on-Thames (adjoining above-named premises). In accordance with specifications, quantities and drawings prepared by William H. Hope, C.E., architect and surveyor, of Hampton Wick, Middlesex, and Billingham, Sussex, who will give any further information required. The plans may be seen and copies of specification and quantities obtained on application to the Secretary, Knapp, Drewett & Sons, Ltd., 20, Clarence Street, Kingston-on-Thames. A deposit of £2 2s. for these particulars is required by the Company. Sealed tenders, duly endorsed, to be delivered to the Secretary as above, not later than 10 a.m. on April 9.

April 9. Lancaster.—*Alteration and extension to the administrative block at the Sanatorium.* Plans and conditions may be seen, and bills of quantities obtained, on application at the office of J. C. Mount, borough surveyor. Sealed tenders to be delivered to T. Cann Hughes, town clerk, Town Hall, Lancaster, by 9 a.m. on April 9.

April 9. Salford.—*Storerooms and pump-house at the Electricity Station, Frederick Road, Pendleton.* Drawings may be seen, forms of tenders and bills of quantities obtained at the Borough Engineer's Office, Town Hall, Salford. Tenders, endorsed "Storerooms, Electricity Station," addressed to the Chairman of the Electricity Committee, must be delivered to L. C. Evans, town clerk, Town Hall, Salford, by 5 p.m. on April 9.

April 9. Cheshunt.—*Public library at Turners' Hill, in accordance with the plans and specification prepared by J. Myrtle Smith, 8, Trafalgar Square, Chelsea, S.W.* Persons desirous of tendering are requested to

forward their names and addresses to the Clerk of the Council, Manor House, Waltham Cross, together with a deposit of £5. Forms of tender and bills of quantities will be forwarded, the persons having made such deposit. Plans and specification can be seen at the office of the Architect as above, and also at the offices of the Council, between 10 and 5, Saturdays 10 to 1. Sealed tenders, endorsed "Tender for Public Library," to be addressed to the Chairman, General Purposes Committee, Cheshunt Urban D. Council, Manor House, Waltham Cross, and delivered not later than 4 p.m., on April 9.

April 9. Itchen Woolston.—*Additions to St. Mark's Girls' and Infants' Council School, for the County Council.* Persons desirous of tendering may see drawings, specification and conditions of contract, and obtain bills of quantities and all necessary information, at the office of W. J. Taylor county surveyor, The Castle, Winchester, between 9 and 5 (Saturdays 9 and 1). A deposit of £2 2s. will be required for a copy of the bills of quantities. Deposits must be made by cheque, payable to Hants County Council and crossed Bank of England, or particulars will not be sent. Tenders, endorsed "Proposed Additions, Itchen Woolston, St. Mark's Girls' and Infants' Council School," are to be delivered to H. Barber, clerk of the County Council, The Castle, Winchester, by 10 a.m. on April 9.

April 10. South Shields.—*Public elementary school, situated in Dean Road, in accordance with plans and specification prepared by J. W. Donald, A.R.I.B.A., 13, West Keppel Street, South Shields.* Contractors desirous of tendering are requested to forward their names and addresses to the Architect, with a deposit of £3 3s. Forms of tender, and bills of quantities prepared by J. P. Allen & Partners, of Newcastle-on-Tyne, will be forwarded to contractors who make the aforesaid deposit. Plans can be seen at the offices of the Architect between the hours of 10 a.m. and 4 p.m. Sealed tenders, endorsed "Tenders for Dean Road School," must be addressed to the Secretary, Education Office, Ocean Road, South Shields, and delivered not later than 4 p.m. on April 10.

April 10. Armley.—*Erection of sheds, boiler-house, and roof chimney to works in Canal Road, Armley.* Plans may be seen and quantities obtained at the offices of Beckwith & Webster, 2, Basinghall Square, Leeds, to whom tenders must be sent by April 10.

April 10. Pontypridd.—*Erection of a mission-hall at Hawthorn, Pontypridd, for Calvary Baptist Church.* Plans and specifications may be seen at the office of Arthur Lloyd Thomas, A.M.I.M.E., architect and engineer, Church Street Chambers, Pontypridd, to whom sealed and endorsed tenders must be sent by April 10.

April 10. Hastings.—*Four cottages in the parish of Brede, adjoining the pumping station of the New Waterworks, for the Corporation.* Drawings and specification may be seen and form of tender and bill of quantities obtained at the office of the borough engineer, P. H. Palmer, M.I.C.E., Town Hall, Hastings, between 10 and 5, on payment of a cheque for £1 1s. Sealed tenders, endorsed "Tender for Cottages at Brede," must be delivered at the Town Clerk's Office, Town Hall, Hastings, not later than noon on April 10.

April 10. London, S.E.—*Improving the Alverton Street School, Deptford, S.E., by providing new classrooms, teachers' rooms, halls, staircases, cloak-rooms, lavatories, w.c.'s, covered playground, new drainage scheme, &c., for the London County Council.* Persons desiring to submit tenders may inspect the drawings and specification and obtain the bills of quantities, form of tender and other particulars at the Education Offices (Architects' Department), Victoria Embankment, W.C., on payment to the cashier of the sum of £5. Tenders must be upon the official forms, and the printed instructions contained therein must be strictly complied with. Fair wages clause. Each tender must be enclosed in an envelope (which will be provided) and delivered at the Education Offices (Room 148), Victoria Embankment, W.C., not later than 11 a.m. on April 10.

April 10. London, W.—*Working men's flats.* The Council of the royal borough of Kensington invite tenders for the demolition of the existing houses, Nos. 4, 6 and 8, Hesketh Place, and 5 and 6, Thomas Place, Notting Dale, and the erection on the site thereof of two buildings, to contain respectively eighteen and eight one-room tenements, in accordance with specification and drawings, which can be obtained at the office of Town Clerk, Town Hall, Kensington High Street, W. Persons proposing to tender will be required to deposit £3 3s. with the borough treasurer at the Town Hall, when applying for a form of tender. Fair wages clause. Sealed tenders, and endorsed "Tender for Working Men's Flats," must be delivered at the Town Clerk's office not later than 4 p.m. on April 10.

April 11. Bradford.—*Construction of stabling sheds at St. James's Market.* Drawings and general conditions of contract may be seen, and bills of quantities and form of tender obtained, on application to the City Architect, Whitaker Buildings, Brewery Street. Fair wages clause. Sealed and endorsed tenders must be delivered to Frederick Stevens, town clerk, Town Hall, Bradford, by noon on April 11.

April 11. Old Clevee.—*New residence, with stabling, &c., for T. P. Carlisle, near Old Clevee.* The plans, specification, and form of contract may be inspected by appointment at the office of Hawkes & Andrew, Williton, and tenders in writing may be

delivered on or before 10 a.m. on April 11 to T. H. Andrew, architect, Minehead.

April 11. London, S.W.—*New wing to almshouses in the Fulham Palace Road, S.W.*, for the Trustees of the Fulham Waste Lands and Lygon Almshouses Charity. Bills of quantities, prepared by T. Woodbridge Biggs, of 10, Clifford's Inn, Temple Bar, E.C., may be obtained from F. C. Cole, Town Hall, Fulham, S.W., on payment of a deposit of £5. Fair wages clause. The bills of quantities are to be filled up and returned with the tender at or before 6 p.m. on April 11.

April 11. Rochester.—*Pulling down and removal of certain houses in High Street, Strood Intra.* Particulars and conditions of contract and form of tender may be obtained of the City Surveyor, Guildhall, Rochester. Tenders are to be delivered to Apsley Kenneth, town clerk, Guildhall, Rochester, before 4 p.m. on April 11.

April 12. Spreyton.—*Pair of cottages for George Lambert.* Plans and specifications may be seen at the office of Harbottle Reed, architect, 12, Castle Street, Exeter, to whom tenders must be sent by April 12.

April 12. Newquay.—*Alterations and improvements at the council schools for the Cornwall Education Committee, according to the specification which may be seen at the schools, or at the office of the architect, B. C. Andrew, Biddick's Court, St. Austell.* Forms, upon which all tenders must be made, may be had from the architect or the secretary. Sealed endorsed tenders to be sent to F. R. Pascoe, secretary, Education Office, Truro, by April 12.

April 12. Hazlemere.—*New Free Methodist Chapel.* Plans and specifications can be seen at H. Tilling's, Wycombe Marsh, to whom all tenders must be sent, marked "Tender," not later than April 12.

April 12. Kendal.—*Proposed alterations and additions to Broom Close, Kendal.* Plans may be seen and quantities and specifications obtained at the office of John F. Curwen, F.S.A., F.R.I.B.A., architect and sanitary engineer, 26, Highgate, Kendal, to whom tenders must be sent not later than noon on April 12.

April 12. Antrim.—*Labourers' cottages in the rural district, for the Rural D. Council, in accordance with plans and specifications, which can be seen at the office of the clerk of the Council, or at the office of the architect, W. T. R. Taggart, Scottish Provident Buildings, Belfast, as follows:*—Two cottages at Townparks, Antrim, on the lands of Dr. Gawn; two cottages at Townparks, Antrim, on the lands of Mrs. Young; one cottage at Islandbawn, Muckamore, on the lands of John Clark; one cottage at Ballyearl, Carmoney, on the lands of William Houston; one cottage at Ballyrobin, Muckamore, on the lands of Scott Gilliland; one cottage at Killyfad, Randalstown, on the lands of John Fulton; one cottage at Annaghmore, Toomebridge, on the lands of B. O'Boyle; one cottage at Portlee, Toomebridge, on the lands of Mrs. McCann; two cottages at Ballynamullen, Toomebridge, on the lands of Felix Laverty; one cottage at Tamnadrigh, Randalstown, on the lands of James Gilbert; four cottages at Cranfield, Randalstown, on the lands of James Charleton; two cottages at Cranfield, Randalstown, on the lands of Bernard O'Kane; one cottage at Cranfield, Randalstown, on the lands of Mrs. Hume; two cottages at Ballydonagh, Crumlin, on the lands of John McClurg; two cottages at Ballyshanagill, Crumlin, on the lands of John Nelson; two cottages at Feehogue, Randalstown, on the lands of Lord O'Neill; four cottages at Lurgan West, Randalstown, on the lands of Lord O'Neill; one cottage at Ballygrooby, Randalstown, on the land of G. L. Young; two cottages at Craigmore, Randalstown, on the lands of J. H. Mulligan; two cottages at Ballymacilhoyle, Crumlin, on the lands of W. S. Thompson. Persons tendering may do so for any or all of the different blocks, but they must name the particular site or sites on their tender. Tenders are to be lodged with J. Clark, clerk of Council, Union Office, Antrim, by 10 a.m. April 12.

April 14. Wakefield.—*New school at Normanton Woodhouse and alterations to Normanton Woodhouse Provided School.*—Builder, joiner, slater, plasterer, iron-founder and smith, plumber, painter. A deposit of £1 is required. Cheques, &c., to be sent to the West Riding treasurer. Those desirous of tendering should send in their names to J. Vickers-Edwards, county architect, County Hall, Wakefield, by April 14.

April 14. Aberayron.—*Alterations and repairs to the school for the Cardigan County Education Committee.* Plan and specification can be seen at the school in charge of the Headmaster. Tenders sealed and endorsed "Aberayron School Repairs" are to be delivered at the office of B. C. Jones, clerk to the District Education Committee, Aberayron, not later than midday on April 14.

April 14. Wakefield.—*New school at Sandal, near Wakefield.* Stainforth (Thorne Union) Provided School: new cloak-room, &c., &c.; Castleford Wheldon Lane Provided School: alterations, repairs, &c. A deposit of £1 is required for each of the above schools, which will be returned on receipt of a bona-fide tender. Cheques, &c., to be sent to the West Riding Treasurer. Builders desirous of tendering must send in their names to J. Vickers-Edwards, county architect, County Hall, Wakefield, by April 14.

April 14. Aberarth.—*Alterations and repairs to the school for the Cardigan County Education Committee.* Plan and specification can be seen at the school in charge of the Head Master. Tenders sealed and endorsed "Aberarth School Repairs" are to be delivered at the office of B. C. Jones, clerk to the District Education Committee, Aberayron, not later than mid-day on April 14.

April 16. Hastings.—*Construction and erection of four covered seats upon the Esplanade at Breeds Place, Eversfield Parade and Grand Parade.* Drawings and specification may be seen and form of tender obtained at the office of the borough engineer, P. H. Palmer, M.I.C.E., Town Hall, Hastings, between 10 and 5. Sealed tenders, endorsed "Tender for Covered Seats," must be delivered at the Town Clerk's Office, Town Hall, Hastings, not later than noon on April 16.

April 18. Sandy.—*New Council school, for the Bedfordshire County Council.* The drawings, specifica-

tions, and form of contract may be inspected at the offices of Gutch & Saunders, architects, Bank Chambers, Kettering, between 11 and 4, on any working day except Saturday. Builders desirous of tendering must send their names and addresses to the above-named architects on or before April 7, together with a deposit of £1 rs., when a copy of the bill of quantities and form of tender will be forwarded to them. Sealed tenders, endorsed "Tender for Sandy Council School," must be sent to W. W. Marks, clerk of the Council, Shire Hall, Bedford, before 5 p.m. on April 18.

April 18. Hunslet.—*Erection of an engineer's house, at the new workhouse, Rothwell Haigh, in accordance with the drawings and specifications prepared by the architect, J. H. Morton, F.R.I.B.A., 50, King Street, South Shields.* Applications for bills of quantities and forms of tender must be made to the architect on or before April 7, accompanied by a deposit of £1. Bill of quantities will be supplied to such applicants only. Drawings may be inspected at the offices of the clerk or the architect, and tenders on the forms provided must be delivered at the Union Offices, Hunslet, Leeds, by 10 a.m. on April 18.

April 18. Aberaman.—*New public hall, institute and free library at Aberaman, Aberdare.* Plans and specification can be seen at the architect's office, Clifton Street, Aberdare, where bills of quantities can be obtained. Sealed and endorsed tenders to be sent in to W. W. Price, Bryn Cottage, Hill Street, Aberaman, not later than April 18.

April 19. Blaydon.—*Enlargement of the Galvanized Iron Isolation Hospital at Normans Riding, comprising the erection of administrative, laundry and discharging blocks and two pavilions, for the Blaydon, Ryton and Whickham Joint Hospital Committee.* Plans and specifications may be seen and form of tender obtained on application to J. B. Renton, Council Offices, Whickham, R.S.O. (who will attend at the Council Offices, Whickham, by appointment, to supply all particulars) upon payment of £1. Sealed tenders, endorsed "Tender for Hospital," must be delivered to Henry Dalton, clerk, Blaydon-on-Tyne, by noon on April 19.

April 20. Wells-next-Sea.—*Enlargement of school for the Norfolk Education Committee.* Builders desirous of tendering can inspect plans and specification and obtain copies of quantities at the office of A. F. Scott, architect, Castle Meadow, Norwich, on and after April 5. A deposit of £1 rs. will be required. Tenders must be delivered by noon on April 20, addressed to "The Secretary, Norfolk Education Committee, 57, London Street, Norwich," and endorsed "Tender for Wells-next-Sea School."

April 20. Tonbridge.—*New Council school, to accommodate 420 children, at Tonbridge, Kent.* The drawings and specification may be inspected at the office of the architect, C. H. Strange, A.R.I.B.A., 20, Dudley Road, Tunbridge Wells. Any person desiring to tender must send in his name to the architect, accompanied with a deposit of £1, not later than noon on April 5. The tenders, on the form supplied, to be delivered to N. R. Stone, 23, Church Road, Tunbridge Wells, not later than noon on April 20.

April 20. Hawkinge.—*Enlargement to the Council school, at Hawkinge, near Folkestone, Kent.* Drawings and specification may be inspected at the office of the architect, Andrew Bromley, Radnor Chambers, Folkestone. Any person desiring to tender, must send in his name to the architect, accompanied by a deposit of £1, not later than noon on April 5. Tenders, on the form supplied, to be delivered to W. Thomas, 66, Broadmead Road, Folkestone, not later than noon on April 20.

April 21. Mold.—*Alterations and extensions to the County School, Mold, Flintshire, North Wales.* Plans and specifications may be seen at the offices of the architect, Samuel Evans, N. & S.W. Bank Buildings, High Street, Mold, from whom bills of quantities may be obtained on payment of a sum of £2 2s. Tenders to be made out on forms to be supplied, and sent in to W. R. Howard Evans, solicitor, Mold, clerk to the Governors, by April 21.

April 23. Coventry.—*Nurses' home, for the Coventry and Warwickshire Hospital Committee, in accordance with plans and specifications prepared by the architects, A. Hessel Tiltman, F.R.I.B.A., 1, Raymond Buildings, Gray's Inn, London, W.C., and Herbert W. Chattaway, Trinity Churchyard, Coventry.* Plans and specifications may be seen at the Architect's Office, Trinity Churchyard, Coventry, and bills of quantities and forms of tender can be obtained upon depositing the sum of £3 3s. Tenders, sealed and endorsed "Nurses' Home," to be sent to Ellis E. Crisp, secty., Coventry and Warwickshire Hospital, Stoney Stanton Road, Coventry, not later than 10 a.m. on April 23.

No date. Stapleford.—*Branch store and four houses, about to be erected in Brookhill Street, for the Stapleford and Sandiacre Co-operative Society, Ltd.* Builders desirous of tendering should apply to Walter H. Woods, M.S.I., architect and surveyor, High Street, Long Eaton, enclosing a deposit for £1 rs.

No date. Harlech.—*Alterations and additions to the Harlech Council School.* The plans, specifications and further particulars may be obtained on application to the county architect, A. M. Howard Jones, M.S.A., Plas Ynys, Borth, R.S.O.

No date. Blaenau Festiniog.—*Building new offices and rearranging the playgrounds at the Boys' Higher Grade School and Slate Quarries Schools, Blaenau Festiniog.* The plans, specifications and further particulars may be obtained on application to the county architect, A. M. Howard Jones, M.S.A., Plas Ynys, Borth, R.S.O.

No date. Stourbridge.—*Two houses at Wollaston, Stourbridge.* Builders willing to tender are requested to apply to Gething & Son, Queen Street, Stourbridge, and Oxford Street, Kidderminster.

No date. Stourbridge.—*Additions to house, Parkfield Road, Stourbridge.* Builders willing to tender are requested to apply to Gething & Son, Queen Street, Stourbridge, Oxford Street, Kidderminster.

No date. Shipley.—*Detached villa in Nab Lane.* Builders desirous of tendering are requested to send their names to Fairbank & Wall, architects, Craven Bank Chambers, Bradford. Quantities will be forwarded as soon as ready.

No date. Southend-on-Sea.—*Erection of a children's ward at the Victoria Hospital.* Tenders invited from builders trading within the Rochford Hundred. Bills of quantities may be obtained and plans inspected on payment of a deposit of £2 2s., to Greenhalgh & Brockbank, architects, Bank Chambers, Southend-on-Sea.

No date. Poole.—*Corn store at Poole, Dorset* (principally steel construction and galvanized iron). The drawings, specification, and conditions of contract may be seen and bills of quantities obtained upon payment of £1 rs., to Fred Bath, F.R.I.B.A., F.S.I., architect and surveyor, Crown Chambers, Salisbury.

ENGINEERING.

April 16. Leicester.—*Erection of a brick and concrete bridge, 30ft. span, over the River Soar, near Narborough, and a similar bridge, 20ft. span, over a stream at Little Bowden, near Market Harborough.* The drawings may be inspected at the offices of the county engineer, S. Perkins Pick, 6, Millstone Lane, Leicester, from whom bills of quantities and forms of tender may be obtained on payment of the sum of £1 rs. for the quantities of each bridge. Sealed tenders, upon the forms supplied, endorsed (a) "Tender for Enderby Mill Bridge," (b) "Tender for Little Bowden Bridge," to be sent to George Rowlett, clerk to the Highway Committee, 10, New Street, Leicester, by 10 a.m., on April 16.

April 17. Stratgarve.—*Constructing about 100 yds., partly embankment—of an approach to bridge at Stratgarve.* Specification is in the hands of D. Macraw, manager, Stratgarve, Garve, who will give all information and receive offers up to April 7.

April 17. Warrington.—*Work at the Winwick Pumping Station.* Conditions of contract and schedule of work required may be had from the Water Engineer on payment of a deposit of 10s. Tenders to be delivered to the Municipal Offices, Warrington, not later than noon on April 7.

April 18. Lockerbie.—*Supply and erection of a bench of retorts, comprising three ovens and fourteen retorts, with all ironwork complete to condensers. Chimney stack for same. Bench to be on shallow regenerative system. Corporation will supply all foundations. Also the following new or second-hand plant:—Condensers, having 8in. connections, complete with bypass, capable of dealing with a maximum of 80,000 cub. ft. per day; two purifiers, 8ft. square, with grids and valves complete; one steam tar and liquor pump, with 2in. or 2½in. suction and delivery; one cast-iron tank, capacity of about 1,000 gallons; one vertical steam boiler, about 4ft. diameter and 8ft. high. Further information may be had from R. W. Cowie, gas manager, Lockerbie. Offers to be sent to D. M'Jarrow, town clerk, Lockerbie, not later than April 8.*

April 9. Corris.—*Three coffer-dams for bridge construction in the River Dovey, near Machynlleth.* Specification and full particulars from J. R. Dix, Corris Railway, Corris, to whom tenders are to be sent, marked "Coffer-dam," not later than April 9.

April 11. Bootle.—*Superheaters and alterations to steel and cast-iron pipes, for the Corporation.* Copies of the specification, forms of tender, general conditions, &c., can be obtained from the Borough Electrical Engineer on depositing the sum of £1 rs. Tenders, endorsed "Superheaters and General," to be addressed to the Chairman of the Electric Power and Lighting Committee, Town Hall, Bootle, and delivered at the Town Clerk's Office by 10 a.m. on April 11.

April 11. Exeter.—*Electric tramways.* Contract No. 6A: For the construction of two additional bays at the Car Depot, Heavitree Road. Contract No. 7: For the construction of permanent-way and paving (including bonding) of about 3½ of a mile of route length line (single line), with passing places. Specifications and forms of tender can be obtained and plans inspected at the office of Thomas Moulding, city engineer and surveyor, Municipal Offices, Southernhay West, Exeter, on or after Mar. 29, on payment of a deposit of £1 rs. for each set. Fair wages clause. Sealed tenders, endorsed "Tramways—Contract No. 7," must be received at the Town Clerk's Office, No. 8, Southernhay, Exeter, on or before April 11.

April 12. Aberdeen.—*Steel girder bridge over the River Don, in the parish of Monymusk, including Masonry Pier, abutments and wing walls, and the construction of approach roads and appurtenant works.* The drawings and general conditions may be seen, and copies of the specification and schedule of quantities may be obtained at the office of Walker & Duncan, engineers, Aberdeen, on payment of £2 2s. Sealed tenders endorsed "Tender for Monymusk Bridge and Road" to be lodged with W. Murison, county clerk, County Buildings, Aberdeen, before noon on April 12.

April 13. Norre Sundby.—*Harbour works.* Drawing and conditions may be obtained from the Chamberlain's Office (Kaemnerkontor), Norre Sundby, or from Ingeniør J. Andersen, Frederiksborg Alle, 3 die Sal, Copenhagen, on payment of 20 kroner (£1 2s.). Tenders must be sent in to the Chamberlain's Office (Kaemnerkontor), Norre Sundby, by April 13.

April 16. Glasgow.—*Construction of a culvert 19½ ft. by 10 ft. by about 215 yds. in length for a diversion of the Yoker Burn between the Lanarkshire and Dumbartonshire Railway and the River Clyde, and also for excavating and embanking about 33,000 cub. yds., to form sidings ground between Yoker Burn and the Green Road, for the Trustees of the Clyde Navigation.* Drawings may be seen and specifications, schedule of quantities, and form of tender obtained, on application to W. M. Alston, the trustees' engineer. Sealed tenders, marked "Tender for Yoker Burn Culvert, &c.," to be lodged with T. R. Mackenzie, general manager and secretary, 16, Robertson Street, Glasgow, not later than 10 a.m. on April 16.

(Continued on p. xiv.)

WESLEYAN HALL AT WHITLEY, READING. W. ROLAND HOWELL, A.R.I.B.A., ARCHITECT.

This new building of the Wesleyan Methodists was opened about a fortnight ago. It comprises a hall 51ft. by 68ft., with gallery, behind which is a schoolroom 33ft. 6ins. by 53ft., with various classrooms, kitchens, &c. The large hall has an open pitch-pine roof, and accommodates 900 persons. Mr. W. Roland Howell, A.R.I.B.A., of Reading, was the architect of the building, the total cost of which (exclusive of site, but inclusive of heating and lighting) has been about £4,300. For the above illustration we are indebted to the "Reading Standard."

IN PARLIAMENT.

(By our Press Gallery Representative.)

The Alterations to the new Government Offices.

IN the House of Commons on Tuesday, March 27th, Sir William Bull asked the First Commissioner of Works whether it had been decided to cease completing the towers on the new Government Offices in Whitehall, and if so, whether in view of the number of masons who would be thrown out of employment, and the amount of stone that had been dressed and carved, he would consider the advisability of completing the original design.

Mr. Lewis Harcourt, in reply, said after consultation with the architects and the Advisory Committee he had decided not to carry the towers on the Charles Street side of the new public offices to the full height as originally designed. This decision was arrived at on two grounds: (1) that owing to the narrowness of Charles Street there was hardly any point of view from which they would have been visible; and (2) if carried out as designed they would have obstructed so much of the light available for the India and Local Government Board offices on the opposite side of the street as to render some of their already limited accommodation practically useless. With regard to the tower on the Great George Street side no decision had been taken as to its ultimate completion, but it would not be carried up to its full height at present, as it must be some years before the remainder of the building towards St. James's Park could be completed or even commenced, and until this was done the erection of only one of a pair of high towers would be architecturally and structurally undesirable. Considerations of economy had not entered into the question.

Another question on this subject was asked by Colonel Legge, who wished to know how many workmen were at present employed on

the new Government offices, and when the buildings would be completed.

Mr. Harcourt replied that the number of men employed on the building was 255; at the masons' yard 96, and 42 joiners at the builders' workshops. There were also a number of carvers. It was anticipated that the buildings would be completed towards the end of 1907.

Dublin College of Science and Art.

Mr. Field asked the Chief Secretary of Ireland whether he could explain the delay in commencing the building of the College of Science and Art in Dublin, and whether he could state when the work would be commenced, in view of the want of employment in Dublin.

Mr. McKenna replied that the work was commenced, a year ago and was still in progress.

No extensions of the National Gallery.

The Chancellor of the Exchequer informed Mr. Napier that the Government regretted that there was no prospect of the extension of the National Gallery, asked for by the trustees, being carried out in the approaching financial year, as it had not been possible to make provision for it in the Estimates. The question would be further considered in the course of the ensuing financial year.

An old Irish Castle as a Bacon Factory.

Replying to Mr. T. L. Corbett, Mr. Bryce, the Chief Secretary of Ireland, stated that he was informed that there were two ancient castles at Roscrea, King's County, one founded in 1213 by King John and the other in 1281 by Edmund Butler, afterwards Earl of Carrick. The latter castle was now the property of the War Department and was in good preservation. Certain persons interested in the establishment of a bacon factory at Roscrea had approached the War Office with a view to the purchase of a portion of the premises, and it had been decided to put the premises up for sale, exclusive of the castle,

by public auction subject to conditions as regards access to and preservation of the castle. There was no danger, therefore, that the castle itself would be used as a bacon factory, and every care would be taken that the castle should not suffer.

British Granite Once More.

Mr. Lambert, replying to Mr. Hay Morgan, stated that the contract for Keyham Dockyard extension did not stipulate that British granite was to be used, and the contractor was entitled to use foreign granite, provided its quality was satisfactory. Answering another question, he said so far as he had been able to ascertain it had not been the custom of the Government in the past to use only British granite in the construction of naval works.

Mr. W. Rutherford, in a question to the President of the Board of Trade, suggested that in view of the importance and magnitude of the manufacture and trade in granite sets on the coasts of Carnarvonshire and the neighbourhood of Newry, in Ireland, and the depression in that trade, foreign-made sets should pay an import duty.

Mr. Lloyd George, in reply, contented himself with a simple negative.

Condition of Winchester Cathedral.—A consultation has been held at Winchester Cathedral between Mr. T. G. Jackson, R.A. (the architect in charge), Mr. Francis Fox (the consulting engineer), Mr. J. B. Colson (the Cathedral architect and surveyor) and Mr. Walter Hill (managing director of the contractors, Messrs. Thompson & Co., of Peterborough) in reference to the pumping that is being carried on. A thorough investigation showed that this is having no effect upon the building or upon the water on the top of the peat, which is that immediately beneath the structure. The work of underpinning is proceeding very satisfactorily. It is estimated to occupy at least three years

Tenders.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, Great New Street, Fetter Lane, E.C. Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Trade and Craft.

Brushes.

We have received a copy of the new catalogue and price list of painting brushes that Messrs. G. B. Kent & Sons, Ltd., have recently brought out. This is altogether the best example of a catalogue dealing with this class of goods we have yet seen. The illustrations of brushes are mostly reproduced from photographs, which show the goods most clearly. The hair, shape and make of the brushes can be properly distinguished, and no imagination has to be used, such as the drawings and wood cuts we have too long been accustomed to require. We reprint one of the illustrations in this catalogue. All who have to deal with painters' tools will not only find this list most useful for reference, but we venture to think instructive, because all kinds of brushes are here illustrated for a variety of circumstances that frequently arise in practice, but in which painters generally make shift with unsuitable tools, so resulting in bad workmanship and wasted time and labour. Messrs. Kent are distinguished among paint brush manufacturers for the high quality of their goods. There are many cheap and nasty brushes on the market. The best brushes may be more expensive at first cost, but they are the cheapest in the long run. A brush should be made of pure hog's bristles, and owing to the disturbed state of Russia the prices of the hair remain very high.

VARNISH BRUSH.

Novelties in Tiles.

The difficulty of securely fixing wall-tiles must be known to our readers. The problem has recently been solved by Messrs. G. Woolliscroft & Son, Ltd., by moulding the back of the tile with grooves undercut in opposite directions, as shown in our illustration. This patent "Grip-Back" tile gives a most effective and unique holding surface,

by which means the tile is held absolutely rigid in its place. These tiles are produced in practically any colour, and the cost is

PATENT

"GRIP" BACK

about the same as glazed bricks. This well-known firm are also the manufacturers of the patent "Grip" roof tile and lath, the use of which precludes the necessity of nailing, and the employment of this system of roofing combines inexpensiveness with durability. Messrs. Woolliscroft have also carried out some very important and extensive work in red and buff terra-cotta, while their operations extend to mosaic work. The mosaics executed by them on the walls of Armagh Cathedral have been very greatly admired.

An Excellent Innovation in Blinds.

The houses of Japan are constructed in a very different fashion to our own. The walls are not solid brick or stone, but consist of wood and plaster and white, thin, tough rice paper stretched over the light latticework that forms the windows and on the outer ranges of sliding screens (*shoji*), or covering the thicker screens (*jusuma*) that form the dividing partitions of the rooms. These paper walls are sanitary, easily and cheaply renewable, and lend themselves to decorative effect. When there are such possibilities in paper, in connection with buildings, it is surprising that we have not put the material to greater use in this country. Tardy recognition has come, however, in one direction where the advantages of paper are so emphatic that they cannot be disputed. We refer to the recent invention of paper window blinds supplied by Messrs. Japa Blinds, Ltd., of 55, Barbican, London, E.C. The Japa Blinds do away with all the old troubles of cloth blinds, those insanitary dust and germ traps, that needed frequent washing, which they did not often get because of the trouble. These paper blinds can be renewed for less money than the washing of old style blinds cost. They are made of a very durable waterproof paper specially prepared for the purpose, and are to be obtained in many pleasing designs. The lower edges are decorated by means of lace made in many patterns.

Saxilby Church Tower has fallen into a very dilapidated condition, and an appeal is being made for £1,200 to restore it.

New Companies.

BRITANNIA BRICK CO., Crewe. Capital: £1,000.

KNIGHTS, SONS & CO., to acquire the business carried on at Pimlico as Knights, Sons & Co., to adopt an agreement with J. J. Knights and others, and to carry on the business of timber merchants and importers, &c. Capital: £24,500.

H. BRAGG & SONS, to acquire the business carried on at Brixton as H. Bragg & Sons, to adopt an agreement with W. L. Bragg, and to carry on the business of builders, contractors, &c. Capital: £5,000.

J. M. BOEKBINDER, to take over the business of a decorator, builder, contractor, &c., carried on by J. M. Boekbinder, with the tenancy of No. 11, Pratt Street, Camden Town, N.W. Capital: £1,000.

PATENT INDENTED STEEL BAR CO., to acquire any invention relating to the reinforcement of concrete in structures or to other methods of constructing buildings with a view to the improvements in their strength or fire-resisting qualities or otherwise, to adopt an agreement with A. L. Johnson, D. E. Garrison, and Sir William Mather, and to carry on the business of manufacturers of steel bars and rails, &c., Westminster, S.W. Capital: £10,000.

Coming Events.

Wednesday, April 4.

INSTITUTE OF SANITARY ENGINEERS.—Mr. H. K. G. Bamber on "The Manufacture of Portland Cement," at 8 p.m.

INSTITUTION OF CIVIL ENGINEERS.—Students' Visit to Rotherhithe Tunnel Works at 2.30 p.m. Mr. B. F. Beverley on "Variations in Direction of the Wind, and an Instrument for Determining them Graphically," at 8 p.m.

Thursday, April 5.

INSTITUTION OF CIVIL ENGINEERS.—Students' Annual Dinner, Trocadero, at 7.30.

CHEMICAL SOCIETY.—Ordinary Meeting at 8.30 p.m.

Friday, April 6.

ARCHITECTURAL ASSOCIATION.—Mr. E. Greenop on "Valuations, Compensations, and Light and Air," at 7.30 p.m.

(Continued from p. 185.)

April 18. Withington.—*Electric lighting of workhouse and hospitals*, for the Guardians of the Charlton Union. Specifications may be obtained from and plans seen at the office of G. R. Peers, A.M.I.E.E., 16, John Dalton Street, Manchester, upon payment of a deposit of £3 3s. Tenders, endorsed "Electric Lighting," to be delivered to David S. Bloomfield, clerk to the Guardians, Union Offices, All Saints, Manchester, not later than 9 a.m. on April 18.

April 18. Brussels.—*Railway plant.* For the construction of the Vollezele to Ninove section of the local railway from Hal to Ninove. The estimated cost of the work is 90,000 francs (£3,600), and a deposit of 9,000 francs (£360) is required to qualify any tender. A copy of the specifications may be obtained on payment of 1 franc from M. Darteville, rue de Turquie, No. 18, Saint Gilles, Brussels. Tenders, in sealed envelopes, should be addressed to the General Manager of the Company, at 14, Rue de la Science, Brussels (where specifications, plans, &c., may be inspected), and sent in by April 18.

April 18. Bristol.—*Electric lighting of the tobacco warehouse, Cumberland Basin, and the maintenance of the work for 12 months after completion.* Drawings can be examined on application to W. W. Squire, Engineer's Office, Cumberland Road, from whom copies of the specification, form of tender, and form of contract can be obtained on production of a receipt from the Secretary of the Docks Committee showing that £3 has been paid as deposit. The tenders must be enclosed in a sealed envelope, endorsed "Tender for Electric Lighting Tobacco Warehouse," and addressed to the Secretary of the Docks Committee, 19, Queen Square, Bristol, and must be delivered to him, accompanied by the necessary documents, before 10 a.m., on April 18.

April 18. Bristol.—*Delivery, erecting in place and maintenance*, for twelve months after erection, of two electrically-driven transporters at the Tobacco Warehouse, Cumberland Basin. The two transporters are of the type which have travelling wheels arranged to run on the lower flange of rolled steel joists, and they are to carry the operator with them. Tenderers will be required to state what work they have done before on a similar nature. Specification, form of tender, form of contract and copy of contract drawing can be obtained from W. W. Squire, engineer's office, Cumberland Basin, Bristol, on production of a receipt from the Secretary of the Docks Committee showing that £3 has been paid as deposit. Tenders must be enclosed in a sealed envelope, endorsed "Tender for Electric Transporters, Tobacco Warehouse," and addressed to the Secretary of the Docks Committee, 19, Queen Square, Bristol, and must be delivered to him accompanied by the prescribed documents before 10 a.m. on April 18.

April 19. Ystradfydwg.—*Driving a tunnel* (mining only) 2,100 yds. or thereabouts in length through the Blaenrhondda Mountain, sinking shafts and constructing works in connection therewith in the parish of Ystradfydwg, in the county of Glamorgan, for the U.D.C. Drawings may be inspected and copies of the specification, schedule of prices and forms of tender obtained upon application to J. E. Hughes, M.I.C.E., engineer, Tynewydd, Treherbert, Glamorgan, upon depositing the sum of £5. Fair wages clause. An assistant engineer will accompany intending contractors along the site of the works on Wednesdays, April 4 and 11, starting from the Engineer's Office at Tynewydd at 11 a.m. Sealed tenders, enclosed in the printed envelopes provided, and addressed to the Chairman of the Gas and Water Committee, endorsed "Tender for Tunnel," must be delivered at the Council Offices, Pentre, Glam., not later than 10 a.m. on April 19.

April 20. Halifax.—*Construction and completion of a single line of railway*, about 4½ miles in length, from Holmfild Station to Southwortham, in the borough of Halifax, in the West Riding of the county of York, together with certain station works connected therewith, according to plans, specifications and conditions prepared by Myers-Beswick & Partners, of Leeds, engineers. Specification and bill of quantities can be obtained on application to Land & Foster, solicitors, 13, Ward's End, Halifax, to whom tenders must be delivered not later than April 20.

April 23. Littlehampton.—*Steel bridge over the River Arun at Littlehampton*, to consist of a swing span and a fixed span, for the U.D.C. Tenders are also invited for the construction of the approaches and abutments in connection with the bridge. Tenders must be sealed and endorsed either "Tender for Bridge" or "Tender for Approaches," and must be delivered to A. Shelley, clerk, not later than 9 a.m. on April 23. For the bridge only those tenders from firms who have erected similar bridges will be considered, and the tenderers must give the names of the swingbridges they have erected. On a deposit of £5 5s. drawings may be seen and copies of the specification, general conditions, bill of quantities and forms of tender obtained on application to the engineer, Major Hector Tulloch, C.B., R.E. (retired), 28, Victoria Street, Westminster, London, S.W., or to Arthur Shelley, clerk, Town Offices, Littlehampton.

May 5. Guernsey.—*Quay wall*, with low-level landing, on the southern side of St. Julian's Emplacement, Harbour of St. Peter-Port, Guernsey. Drawings of the proposed works may be inspected, and the general conditions, specifications and forms of tender and other particulars obtained, upon application at the States Offices, Guernsey, on payment of £5. Tenders, enclosed in sealed envelopes, endorsed "Tender for Quay, St. Julian's," and addressed to John N. Brouard, supervisor of the harbour, &c., must be delivered so as to reach the States Office, Guernsey, on or before 3 p.m. on May 5.

May 12. Brussels.—*Railway plant.* For the construction of the section from S. Cécile to the French frontier, of the railway from Bétrix to the frontier via Muno. Estimated cost, 3,500,000 francs (£140,000); deposit, 190,000 francs (£7,600). Specifications ("cahier des charges," special No. 27) may be obtained at the Bourse, Brussels (price 4 francs 70 cents), where tenders will be received up to May 12.

No date. Alexandria.—*Refuse destructor.* The Municipality propose to establish either one destructor, capable of burning 200 tons of refuse per day, or two destructors with a capacity of from 80 to 120 tons each. No public call for tenders will be made; persons interested should therefore communicate with the Municipality of Alexandria, enclosing tenders and plans.

IRON AND STEEL.

April 6. Aberdare.—*Supply and delivery of 24-in. cast-iron pipes.* Specification and particulars can be obtained from the Surveyor, Town Hall, Aberdare. Tenders, endorsed "Tender for Pipes," must be delivered to Thomas Phillips, clerk, Town Hall, Aberdare, on or before April 6.

April 6 and 7. Brescia.—*Supply of iron and steel for the Italian (Royal) Arms Factory as follows:*—(1) Iron in rods, &c., to the estimated value of 13,008 lire (about £520); (2) steel for bayonets and parts of swords, to the estimated value of 3,710 lire (about £148); and (3) brass in wire and sheets, to the estimated value of 2,475 lire (about £99). Tenders for (1) and (2) will be received up to April 7, and for (3) on April 6. They should be addressed to "Direzione d'Artiglieria della Fabbrica d'Armi in Brescia, Italy."

April 10. Isleworth.—*Supply and erection of an iron escape staircase* to be fixed at Percy House, Mill Plat, Isleworth, according to plan and specification prepared by W. H. Ward, architect, Birmingham. Plan and specification may be seen upon personal application at the Union Offices, Isleworth, W. Tenders, endorsed "Tender for Escape Staircase," must be delivered to William Stephens, clerk to the Guardians, Union Offices, Isleworth, W., by 4 p.m. on April 10.

April 11. Stockport.—*Supply of 3-in. and 4-in. cast-iron mains, and for irregulars from 3-in. to 8-in.* Specifications and particulars can be obtained from the engineer, S. Meunier. Fair wages clause. Tenders, endorsed "Mains," must be addressed to the chairman of the Gas Committee and be delivered at the Town Clerk's office on or before April 11.

April 17. Stockholm.—*Rolled steel joists for the Swedish State Railways* ("Flussisen" quality) of two kinds, I and L, for bridge-building and for wagons. Further particulars (in Swedish), together with notices regarding the manufacture, testing and delivery of the joists, may be seen at the offices of the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, London, E.C. Sealed tenders, marked respectively "Anbud a balkar for bbygggnader" and "Anbud a balkar for vagnstilverkning," should be addressed to "Kungl. Jernvägsstyrelsens Registrator, Stockholm," where they will be received up to noon on April 17.

PAINTING AND PLUMBING.

April 5. Cairo.—*Paint brushes, &c.* Tenders, accompanied by stamped paper of 30 millimètres, must be sent by registered post to the Directeur Général, Chemins de fer de l'Etat, Cairo, before April 5. Specification, &c., and form of tender may be obtained on application to Col. J. H. Western, R.E., Queen Anne's Chambers, Westminster, S.W., on payment of 2s. per copy. A copy of the specification may be seen at 73, Basinghall Street, E.C.

April 6. Crediton.—*Extensive repairs and external painting to the Union Workhouse.* Specifications and conditions can be seen and full particulars obtained of the Master at the Union Workhouse. Sealed and endorsed tenders for the whole of the work to be sent to William Pope, clerk, 31, High Street, Crediton, by April 6.

April 9. Halifax.—*Outside painting of Council schools.* Specifications and forms of tender may be obtained on application to James Lord, C.E., borough engineer, Town Hall, Halifax. Tenders, endorsed "Painting Council Schools," must be sent to W. H. Ostler, education secy., Halifax, on or before noon on April 9. Fair wages clause.

April 9. Manchester.—*Painting various bridges over the Rochdale and Ashton Canals.* Specification and form of tender may be obtained on application at the City Surveyor's Offices, Town Hall, Manchester, on payment of £1 1s. Tenders, enclosed in the official envelope and addressed to the Chairman of the Paving, &c., Committee, to be delivered at the City Surveyor's Office not later than 10 a.m. on April 9.

April 10. Cleckheaton.—*Painting the exterior of the hospital buildings and premises, situate in Oakenshaw Road, also for a considerable amount of painting work, &c., inside, for the North Brierley Joint Hospital Board.* Fair wages clause. Specifications can be obtained on application to W. H. Clough, clerk, Town Hall, Cleckheaton, to whom tenders, endorsed "Tenders for Painting," are to be sent not later than April 10.

April 11. Norwich.—*Painting (externally) various provided schools, the whole of the work to be carried out forthwith.* Specification and quantities may be obtained from C. J. Brown, architect, The Close, Norwich, on and after April 4, from 10 a.m. to 4 p.m., upon payment of a fee of 5s. per school. Tenders, endorsed "Tender for Painting," to be sent to the above address by April 11.

April 11. Toxteth Park.—*Painting, &c., at the Workhouse, Smithdown Road, according to specification to be seen there upon application to the master.* Tenders, marked externally "Painting, &c.," to be sent to R. Albert James, clerk to the Guardians, 15, High Park Street, Liverpool, by April 11.

April 11. Toxteth Park.—*Painting, &c., at the Children's Home, Church Road, Watertree, according to specification to be seen at the Home upon application to the Superintendent.* Tenders, marked externally "Painting, &c.," to be sent to R. Albert James, clerk to the Guardians, 15, High Park Street, Liverpool, by April 11.

April 11. London, S.W.—*Supply of oilman's goods during the period ending Mar. 31, 1907, for the Chelsea Borough Council.* Forms of tender, and information

respecting the contracts, may be obtained at the Town Hall, where samples may be inspected. Tenders must be placed in the box provided for that purpose in the Town Clerk's Office not later than 5.15 p.m. on April 11.

April 12. Belper.—*Painting at the Isolation Hospital.* Specification can be seen on applying to the Matron at the Hospital. Tenders to be sent to Joseph Pym, clerk, Belper, not later than April 12.

April 12. London, S.E.—*Cleaning and painting work at Newington Workhouse, Westmoreland Road, Walworth, S.E., for the Southwark Guardians.* The specification can be seen and all information obtained at the offices of the Master of the Workhouse as above, between the hours of 10 and 4. Tenders, endorsed "Cleaning and Painting Work" should be addressed to the Guardians and delivered at the Union Offices, John Street West, Blackfriars Road, S.E., by 4 p.m. on April 12. Fair wages clause.

April 12. Warrington.—*Painting part of the outside wood and ironwork at the Lancashire County Asylum.* Persons desirous of tendering must measure up the work themselves, between 9 and 12 a.m. and 2 to 5 p.m. on any of the following days—the 28th, 29th and 30th inst. Tenders must be made upon forms, which can be obtained from H. Ellis, clerk, and must be delivered at the Asylum not later than 8 a.m. on April 12, addressed to "The Chairman," and endorsed "Tender for Painting."

April 12. Winchfield.—*Supply of 5 tons of sheet lead* (5 lbs. to the foot), carriage paid, to the Workhouse. Tenders, marked "Tenders for Lead," must reach W. H. Wright, clerk to the Guardians, Odiham, Hants, not later than 9 o'clock on April 12.

ROADS AND CARTAGE.

April 5. Aberdeen.—*Macadamising, &c., at Forest Avenue.* Plans may be seen, and specification, schedule of quantities and form of tender obtained on application to W. Dyack, borough surveyor, Burgh Surveyor's Office, 41½, Union Street, Aberdeen, with whom sealed tenders, properly endorsed, must be lodged before noon on April 5.

April 6. Penzance.—*Raising stone at Polmennor Quarry.* Specification to be seen at the office of the Borough Surveyor. Tenders to be sent in to the Public Buildings, Penzance, by April 6.

April 6. Tain.—*Maintaining the 17th section of district roads* (North Division, Rosskeen Parish), for three years, from May 15, 1906. Copies of the specification to be had from the District Road Surveyor, or at the District Clerk's Office in Tain. Offers to be lodged with W. J. Munro, district clerk, Tain, by April 6.

April 7. Cardiff.—*Repairs to the roads' and paths at the Headquarters Homes, Ely, for the Guardians, according to specification, a copy of which, together with forms of tenders, may be obtained from the clerk.* Forms of tender, with specification attached, endorsed "Tender for Repairs to Roads, Ely," must be forwarded to Arthur J. Harris, clerk, Union Offices, Queen Chambers, Cardiff, not later than 10 a.m. on April 7.

April 7. Blything.—*Supply of 2,900 tons of granite, consisting of 800 tons of 2½-in. granite, 1,900 tons of 1½-in. granite, and 200 tons of granite chips for the R.D.C., to be delivered on or before the 31st day of July next, at the following places, in such quantities as may be required by the Surveyor, viz., Saxmudham, Darsham, Halesworth, Beccles, Leiston, Brampton, Wenham, Blythburgh, Walberswick, Southwold and Laxfield Stations, Beccles Quay and Lowestoft South Quay.* Tenders to be sent to Harold A. Mullens, clerk, Union Offices, Bulcamp, Halesworth, not later than April 7. No printed form of tender is issued.

April 7. Frodingham.—*Supply of about 400 tons of whinstone, delivered free at Frodingham and Gunness Stations, Great Central Railway.* Specification and forms of tender may be had on application to J. Green, surveyor, Council Office, New Frodingham, Doncaster, to whom tenders must be sent not later than April 7.

April 9. Woodham Ferris.—*Repair of the highways in this parish for the year ending March 1907, for the Chelmsford R.D.C.* Forms of tender and full particulars can be obtained from F. E. H. Powell, surveyor of highways. Tenders to be endorsed "Tender for Repair of Highways," and delivered to W. W. Duffield, clerk to the Chelmsford R.D.C., High Street, Chelmsford, by noon on April 9.

April 9. Aylesbury.—*1,707 tons of granite and 400 tons of slag for the repair of the roads for the R.D.C.* Full particulars of the granite and slag, and the stations and places at which it is to be delivered, will be found in the form of tender, to be obtained by forwarding a stamped addressed foolscap envelope. Tenders must be delivered to F. B. Parrott, clerk to the R.D.C., Bourton Street, Aylesbury, by noon on April 9, and a sample must be forwarded, free of expense, with the tender.

April 9. Leeds.—*Supply of Yorkshire flags, kerbs, pavors, and setts during the year ending Mar. 31, 1907, for the Corporation.* Tender forms, specifications, and further particulars may be obtained at the Highways Office, 155, Kirkstall Road. Samples of the several kinds of material are deposited at the City Highways Department, 155, Kirkstall Road, and must be inspected before tenders are sent in. Sealed tenders, endorsed "Tenders for Yorkshire Stone," and addressed to the Highways Committee, must be sent in to the Town Clerk's Office, not later than noon on April 9.

April 10. Aberdeen.—*Quarrying and breaking stones in the Braemar, Tarland, Aboyne, Kincardine O'Neil, and Cluny and Midmar sub-divisions of the Deeside district.* Schedules of quantities may be had on application to John Milne, district road surveyor, Aboyne, and sealed orders will be received by John Murray, district clerk, 22, Bridge Street, Aberdeen, up to April 10.

April 10. Tynemouth.—*Excavating, laying concrete foundation, and paving with whinstone setts and granite setts in Tynemouth Road, North Shields.* Plans and specification may be seen at the office of John F. Smillie, borough surveyor, to whom tenders must be sent by 10 a.m. on April 10.

April 11. Romford.—*Enlargement of Mawneys Road Schools, to accommodate an additional 400 children.* Contractors desirous of tendering should send in their names to the architects, Harrington & Ley, 65, Bishopsgate Street Without, E.C., accompanied by a deposit of £2 2s., on or before April 11.

April 11. Wimbledon.—*Supply of two water-vans, in accordance with specification to be obtained on application.* Sealed tenders, endorsed "Tender for Water-Vans," addressed to the Chairman, Highways Committee, to be delivered not later than noon on April 11.

April 12. Cowpen.—*Providing and laying about 1,700 lineal yds. of Whinstone or granite kerb in Morpeth Road, from Kitty Brewster to Cowpen Row, for the U.D.C.* Plan, section, and specification may be seen, and form of tender obtained, at the offices of Robert Grieves, surveyor, Seaford Street, Waterloo, Blyth. Tenders, endorsed "Tender for Kerbing," must be delivered not later than 4 p.m. on April 12, to the surveyor.

April 12. Sudbury.—*Supply of granite for the West Suffolk County Council.* Particulars and form of tender may be obtained on application to A. Ainsworth Hunt, county surveyor, Sudbury, Suffolk, to whom tenders are to be delivered by April 12.

April 12. Castleford.—*Works of improvement in Smawthorne Lane (back), Ambler Street, Richmond Street (back and front), in accordance with the plans and specifications prepared by the surveyor, William Green, to the Council, at whose office the same can be seen during office hours.* Sealed tenders, endorsed "Street Improvements," to be sent to H. H. Broadbent, clerk to the Council, Council Offices, Castleford, by noon on April 10.

April 12. Liversedge.—*Kerbing, flagging and paving, on concrete bed (5,700 sq. yds.), required to be done on the Leeds and Whitehall Road, and the Birstall and Huddersfield Road, for the U.D.C.* Plans and specifications may be seen and quantities obtained from F. Langley, engineer and surveyor, Liversedge, up to April 12, and on the latter date sealed tenders, endorsed "Tender for Main Road Paving," are to be delivered to T. Mitcheson, solicitor and clerk to the Council, Council Offices, Liversedge, not later than 4 p.m. All applications for quantities must be accompanied by a deposit of £2 2s.

April 14. Ruskington.—*Supply of granite, slag and ironstone, to Ruskington Station (carriage free) during the season, for the U.D.C.* Prompt deliveries in accordance with contracts will be insisted upon, failing which the penalty clauses will be enforced. Forms of tender may be had on application to the Clerk. Tenders, with samples, stating price per ton, to be sent to J. B. Trafford, surveyor, Ruskington, on or before April 14.

April 14. Ruskington.—*Carting granite and ironstone from Ruskington Station to the Lincoln Road, Tattershall Road and Westcliffe Road, and also the Fen Road and Washdyke Road during the season, for the U.D.C.* Tenders are also required for carting by the day. Tenders to be sent to J. B. Trafford, surveyor, Ruskington, on or before April 14.

April 18. Bournemouth.—*Making-up the following roads:—Firs Glen Road, Winton, A.A. (about 460ft. long); Firs Glen Road, Winton, B.A. (about 370ft. long); road rear of Parade, Boscombe (about 260ft. long).* Full particulars, form of tender, specification and schedule can be obtained of the borough engineer, F. W. Lacey, at whose office drawings can be seen provided that the sum of £1 rs. has been previously deposited. Tenders to be sent in, in envelopes furnished for the purpose, to the Town Clerk before 11 a.m. on April 18.

April 18. Bradford.—*20,000 tons of road metal required for the macadamised roads within the city, for the Corporation.* Form of tender may be obtained on application at the office of J. H. Cox, city surveyor, at the Town Hall. Fair wages clause. Sealed tenders, endorsed "Tender for Road Metal," to be sent to Frederick Stevens, town clerk, Town Hall, Bradford, on April 18.

April 18. Crediton.—*Widening a portion of the main road from Crediton to Cadbury, in the parish of Stockleigh Pomeroy, according to conditions and specifications which can be seen on application to the surveyor of the R.D.C., S. Pridham, Cheriton Fitzpaine, from whom all particulars can be obtained.* All tenders to be sent to the Clerk, at No. 31, High Street, Crediton, on or before April 18.

April 18. Shildon.—*Excavating, levelling, paving, metalling, channelling, &c., of All Saints Road, Bouch Street and Back Redworth Street (from Scott Street to Charles Street).* Plans and specifications may be seen and quantities obtained on application to the surveyor, M. Turnbull, Shildon. Separate tenders, properly endorsed, to be sent to J. T. Proud, clerk to the Council, Council Offices, Shildon, by April 18.

April 19. Oakham.—*Supply of about 700 tons (more or less) of broken granite, granite chippings and screenings, to be delivered free at various railway stations, from May to November, for the County Council.* The Council also invite tenders for team-labour for the delivery of the granite from the various railway stations to the main roads within the above-mentioned district. Forms of tender and full particulars of the estimated quantities and materials required for delivery and to be carted from the different railway stations to the main roads may be obtained from the clerk. Sealed tenders, endorsed "Tender for Road Materials," or "Tender for Team Labour," must be delivered to B. A. Adam, clerk of the Council, Oakham, by April 19.

April 21. Conway.—*Making-up of Marine Crescent, Deganwy.* The drawings and specifications may be seen, and form of tender, with schedule of approximate quantities and other particulars, at the office of F. A. Delamotte, borough engineer and surveyor, Town Hall, Conway, upon payment of a deposit of £1. Sealed tenders, in the envelopes provided, endorsed "Tender for Marine Crescent," must be delivered to T. E. Parry, town clerk, Castle Street, Conway, by April 21.

No date. Sidmouth.—*Steam rolling, for the U.D.C., for the year ending Mar. 31, 1907.* For further particulars apply to the Surveyor.

SANITARY.

April 7. Congleton.—*For the following works:—Main sewer, gin. diam., 390 yds. in length; labour, &c., in laying 2,400 yds. of water-main.* Specification, bills of quantities, forms of tender obtained, and the drawings examined on application to the Surveyor. Tenders to be delivered at the office of the Town Clerk, endorsed "Tender for Sewer or Water-main," addressed to A. Plant, town clerk, on or before April 7.

April 9. Leeds.—*Range of urinals in Burmantofts Street; additional entrance to urinal at Victoria Cattle Market.* Particulars may be obtained at the City Engineer's Office, Municipal Buildings, Leeds. Tenders, properly endorsed, should be received at the Town Clerk's Office not later than 10 a.m. on April 9.

April 10. Walton-on-Thames.—*Sewerage works.* Construction of 270 yds. of 8in. cast-iron pipe sewer, together with manholes and house connections, in Russell Road. The drawings and specification may be seen and bill of quantities obtained on application at the Council Offices, Walton-on-Thames, on payment of £1 rs. Sealed tenders, endorsed "Russell Road Sewerage," are to be delivered to R. Wilds, engineer and surveyor, Council Offices, Walton-on-Thames, not later than 4 p.m. on April 10.

April 10. Paisley.—*Sanitary fittings proposed to be executed in erecting a public convenience at the West End Cross.* Plans may be seen and schedule of quantities obtained at the Master of Works Office, 13, Gilmour Street. Sealed offers, marked "Tender for Sanitary Fittings at West End Cross," to be lodged with Far. Martin, town clerk, Municipal Buildings, Paisley, by 10 a.m. on April 10.

April 11. St. Austell.—*Supply of socket drain pipes in such quantities and at such times as may be required by the surveyors of the R.D.C. up to Mar. 31, 1907.* Each tender must state the net price for first and second qualities of 6in., 8in., 10in., and 12in. pipes, of 2ft. lengths respectively delivered carriage paid at Par or St. Austell Railway Stations. The Council do not require less than a 4 ton truck load to be delivered at any one time. Further particulars can be obtained of A. J. Blight, highway surveyor, Telowith, St. Austell, and sealed tenders, marked "Tenders for Pipes," must be sent to John Stephens, clerk to the Council, St. Austell, not later than April 11.

April 14. Portsmouth.—*Construction of sewers, manholes, &c., and all accessories in Tangier Road and through Baffin's Estate into Milton Road and thence to Bransbury Road, at Eastney, in the said borough.* On payment of the sum of £5 a lithographed copy of the specification, general conditions and bill of quantities, with form of tender, can be obtained on application to the Town Clerk, and any further particulars can be obtained at the Borough Engineer's Offices at the Town Hall, Portsmouth. Tenders, marked "Tender for Tangier Road Sewer," must be filled up, signed and returned, with the bill of quantities duly filled in, to A. Hellard, town clerk, not later than 10 a.m. on April 14.

April 18. St. Breward.—*Trenching and laying of gin. diameter cast-iron and stoneware pipes from Stannon to near Wenford Bridge, in the parish of St. Breward, a distance of over 5 miles, and other works, for the North Cornwall China Clay Co., Ltd.* Plans and specification may be seen at the office of T. H. Andrew, engineer, Market Hill, St. Austell, until April 11, and tenders will be received by him not later than April 18.

April 19. St. Austell.—*Sewerage and sewage-disposal of the districts of Charlestown, Tregonissey and Slades, for the R.D.C.—2,317 yds. run of 6in. stoneware pipe sewers, 4,522 yds. run of gin. stoneware pipe sewers, 120 yds. run of 12in. stoneware pipe sewers, 150 yds. run of gin. cast-iron pipe sewers, together with manholes and other works, the construction of storage culvert, with cast-iron pipe outlet to low water.* The whole to be let in one contract. Drawings and specification may be seen at the offices of the engineers, Beesley, Son & Nichols, M.M.I.C.E., of 11, Victoria Street, Westminster, S.W., where also specification, bills of quantities and form of tender can be obtained on deposit of £5. Sealed tenders, endorsed "Sewerage and Sewage Disposal," are to be delivered to John Stephens, clerk to the R.D.C., St. Austell, before 10 a.m. on April 19.

April 30. Middleton.—*Construction of three circular tanks, catchpits, conduits, &c., at the Sewage Outfall Works at Rhodes.* Plans may be seen and specifications, quantities and form of tender (which includes a fair wages clause) obtained on and after April 5 by applying to W. Welburn, borough surveyor, Town Hall, between 9.30 and 10.30 a.m., on depositing £1 rs. Tenders, endorsed "Tender for Tanks," are to be addressed to the Chairman of the Surveyor's Committee, and delivered at the Town Clerk's Office on or before April 30.

May 5. Mumby-cum-Chapel.—*Construction of two new cloughs or inlandgouts, one in the Orby Drain, the other in the Willoughby Drain, for H.M. Commissioners of Sewers.* Plans and specifications of the proposed works may be seen at the office of Charles T. Dennis, surveyor of sewers, Mablethorpe, to whom tenders, endorsed "Tender for Cloughs," are to be sent not later than May 5.

No date. High Wycombe.—*Additions to the boys' lavatories at the Central Schools for the Borough Education Committee.* For particulars apply to Thomas Thurlow, architect.

TIMBER.

April 9. Brighton.—*30,000 jarrah wood paving blocks 3in. by gin. by 4 1/2 in. (actual finished size), delivered at the Hollingdean Road Siding.* Sealed tenders, endorsed "Tender for Jarrah Wood Paving Blocks," must be addressed to Hugh Talbot, town clerk, and left at his office, Town Hall, Brighton, before 10 a.m. on April 9.

April 9. London, N.—*Supply and delivery of jarrah, black butt and other hardwood paving blocks, and of creosoted yellow deal paving blocks, for the Islington Borough Council.* Specification and particulars can be obtained upon application to the borough engineer, J. Patten Barber, Town Hall, Upper Street, Islington, N. Sealed tenders, endorsed "Tender for Wood Blocks," must be received by W. F. Dewey, town clerk, Town Hall, Upper Street, Islington, N., by April 9.

April 9. Stone.—*Erection of wood or canvas and wood fencing (as may be determined); also shedding, with loose-boxes or partitions for stock and implements; also a grand stand, &c., in the showyard at Stone, on July 18 and 19, for the Staffordshire Agricultural Society.* Contractors may tender for the whole of the work or part. Forms of tender and full particulars may be obtained from J. P. Jones, secty., Newcastle, Staffordshire, to whom tenders must be sent by April 9.

MISCELLANEOUS.

April 5. London, E.C.—*Supply of the following stores for the Great Indian Peninsula Railway Co.:—Expanded brass, mild steel firehole shield plates, lamps and lamp fittings, reversible cast-steel crossings, water cranes, bolts, nuts, rivets, coach screws, &c., lamp glasses, &c., Portland cement fencing materials.* Specifications and forms of tender may be obtained at the offices, on payment of the fee for the specification, which payment will not be returned. Tenders must be delivered in sealed envelopes, marked "Tender for Expanded Brass," or as the case may be, and sent to J. I. Berry, secty., 48, Cophall Avenue, E.C., London, not later than 11 a.m. on April 5.

April 6. Smethwick.—*Supply of the following materials for one year, for the Corporation:—Broken Clew Hill granite; broken and unbroken Rowley ragstone, kerbs, circles, elbows and setts; steel shovels and steeled picks, scrapers, mud-scoops, digging forks, and galvanized sanitary ash-bins, all Smethwick pattern; bricks (Staffordshire brindle and common); scavenging and dandy brushes and pick-helves; gully grates, frames and weirs; manhole and lamp-hole covers and cast-iron trunks, all Smethwick pattern; glazed earthenware pipes; cement (best heavy Portland); lime; carbolic disinfectant powder.* All the above to be delivered at the contractor's cost to the Highway Stores, Stony Lane, except the following:—Ragstone: Separate prices to be given for delivering to Spon Lane Wharf and Rolfe Street Depot Wharf. Forms of tender may be obtained from the Borough Surveyor. Tenders, addressed to the Chairman of the Public Works Committee, to be sent under seal not later than 10 a.m. on April 6.

April 7. Bedford.—*Two tip wagons for the removal of house refuse, two street watering vans and three general purpose carts, for the Corporation.* Full particulars can be obtained upon application to the Borough Surveyor, Town Hall, Bedford. Sealed tenders, endorsed "Tender for New Vans, &c.," addressed to the Chairman of the Streets and Buildings Committee, to be delivered at the Borough Surveyor's Office by noon on April 7.

April 7. London, S.E.—*Supply of the following stores for the South-Eastern and Chatham Railway Co.'s Managing Committee:—Iron bars, plates and sheets; (Section No. 1) general ironmongery; (Section No. 2) bolts, nuts, rivets, nails, &c.; steel bars and plates; finished brass and copperwork; lead, tinplates, tin and zinc goods; glass and lamp materials; paints, &c.; brushes; woodwork; gas and water fittings.* Specification and forms of tender may be had on application in writing to the Superintendent of Stores, 84, Tooley Street, London, S.E. Forms of tender for each contract are printed separately, and parties applying should state the particular contract for which they propose to tender. Patterns may be inspected up to 6th April at the Stores Depot, Bricklayers' Arms Station, between 10 and 4; and any further information required may be obtained at the Superintendent's Office, 84, Tooley Street, S.E. Tenders to be endorsed "Tender for Stores," and addressed to Charles Sheath, secty., London Bridge Station, on or before April 7.

April 9. Upholland.—*Supply of the following materials, for the U.D.C.:—Setts, flags, kerbs, channel stones, broken stone, slag, oil, gulleys, grids, spades, shovels, scoops, lamp glasses, disinfectants, drain pipes, manhole covers, step irons, bricks and cement.* Further particulars may be obtained on application to the Clerk or the Surveyor. Sealed and endorsed tenders to be sent in to the Council Offices, Upholland, not later than April 9.

April 10. Wimbledon.—*Supply and delivery of fire hydrants for a period of two years, the minimum quantity required being fifty, for the Corporation.* Conditions and specification may be obtained on application to the Borough Engineer and Surveyor. Sealed tenders, endorsed "Tender for Fire Hydrants," addressed to the Chairman of the Watch Committee, to be delivered not later than noon on April 10.

April 16. Dundee.—*Supply of the following stores for the Corporation:—Steel tyres and steel wheels; iron &c.; ironmongery, including bolts, nuts, &c.; chilled iron car wheels and brake blocks; oil, &c.; paints, varnishes, &c.; sand; electrical, accessories, including armature coils; pinions and gears.* Samples can be seen, and specification, with forms of tender, can be obtained on application to P. Fisher, general manager, Tramway Offices, Dundee. Sealed offers, suitably marked outside, must be lodged with W. H. Blyth Martin, town clerk, Dundee, not later than April 16.

April 18. Glasgow.—*Jobbing work and supply of the following articles and materials during the year from June 1 to May 31, 1907:—(1) Painterwork; (2) mason work; (3) plumber and gasfitter work; (4) ironmongery; (5) timber; (6) glass; (7) lime and cement, and (8) paints and oils, &c.* Schedules and forms of offer may be obtained on application at the office of W. C. Menzies, the manager, 22, King Street, City. Tenders, marked "City Improvements Department: Offer for Jobbing Work, &c.," must be lodged with A. W. Myles, town clerk, City Chambers, Glasgow, on or before April 18.

HALL'S

SANITARY WASHABLE DISTEMPER

The Modern Wall Covering.

The most popular wall covering of to-day is Hall's Sanitary Washable Distemper. It works easily, sets hard and dries with a uniform surface, equal to flatted oil paint.

It is made in 73 colours, including rich dark as well as light shades.

One cwt. of Hall's Distemper mixed with water to the consistency of cream, will cover double the surface of one cwt. of pure White Lead Paint and save 40 per cent. of the cost of labour.

"Sisco" White Japan is the correct material for painting Doors, Picture Rails, and all Woodwork of rooms decorated with Hall's Distemper. "Sisco" Japan is a pure white decorators' enamel, which dries with a hard, smooth lustrous surface. It lasts for many years with beauty unimpaired.

The French Asphalte Co., Ltd.

(ESTABLISHED 1871),

Supplies only the best material from their own mine of St. Jean de Maruajols, combined with the best workmanship.

COMPLETE SATISFACTION GIVEN TO THE LEADING ARCHITECTS.

Apply for Prices:—

5, Laurence Pountney Hill, Cannon Street, E.C.

PYTHO

PLASTER

Unsurpassed for interior work. Only two coats required. As hard as Keene's Cement. Costs about the same as Lime Plastering.

THE PLASTER BRICK AND STONE CO., LTD.,
 WALL GRANGE, near LEEK.

Bankruptcies.

[Abbreviations: R.O.—receiving order; P.E.—public examination; C.C.—county court; O.R.—official receiver; Adj.—Adjudication.]

DURING THE WEEK ending March 30th thirty failures in the building and timber trades in England and Wales were gazetted.

W. WALKER, plumber and glazier, Ashton-under-Lyne. R.O. March 23rd.

R. E. BEESLEY, builder, Wood Green. Adj. March 23rd.

LANGTON & Co., builders' merchant, Brentford and Twickenham. R.O. March 23rd.

J. CHARLESWORTH, builder, Wolstanton. Adj. March 26th.

T. W. PLOWMAN, carpenter and builder, Ipswich. Adj. March 23rd.

G. H. MIGHALL, builder, West Hoathly. Adj. March 19th.

J. D. DENNY, architect and surveyor, Liangollen. R.O. March 21st.

S. BRANDFORD, painter and plumber, Claverley. Deficiency £218.

B. COOKE & Co., builders and contractors, London. Liabilities £91,371; assets £42,826.

T. SECKERSON, builder and contractor, Dudley. Liabilities £2,578; deficiency £1,755.

R. OLDROYD & SONS, contractors, Ossett. First meeting, O.R.'s, Dewsbury, April 4th, at 10.30. P.E., Dewsbury C.C., May 1st, at 2.

G. BAKER & SON, builders, Wimborne. Liabilities £674; assets, estimated to produce £193, have only realized £165.

T. BIDDULPH, builder, Hulme. First meeting, O.R.'s, Manchester, April 4th, at 3. P.E., Manchester C.C., April 9th, at 10.

E. DENNY, builder, Grange-over-Sands. First meeting, O.R.'s, Barrow-in-Furness, April 5th, at 11.15. P.E., Temperance Hall, Ulverston, April 5th, at 2.45.

J. LUNT & Co., paint, oil and colour dealers, Liverpool. First meeting, O.R.'s, Liverpool, April 4th, at 2.30. P.E., Liverpool C.C., April 23rd, at 11.

E. SUTTON, builder, Hinckley. First meeting, O.R.'s, Leicester, April 5th, at 12. P.E., The Castle, Leicester, April 6th, at 10.

A. A. GALE, builder and contractor, Woking. First meeting, 132, York Road, Westminster Bridge, April 5th, at 12.30. P.E., Guildford Town Hall, April 10th, at 1.

ROOFING SLATES:
Velinheli, Penrhyn, and Westmoreland.
SLATE SLAB GOODS:

ELEVATORS

(or LIFTS).

“OTIS” ELEVATORS:
Electric, Hydraulic, Steam, &c., &c.

“OTIS” ELEVATORS ARE INSTALLED IN THE FOLLOWING AMONGST OTHER IMPORTANT BUILDINGS:

Buckingham Palace (4). Bank of England (1). Windsor Castle (5). Houses of Parliament (1).
Savoy Hotel (26). Hotel Cecil (18). Carlton Hotel (5).
North British Hotel, Edinburgh. Caledonian Railway Co.'s Princes Street Station Hotel, Edinburgh, &c.

AND AT THE STATIONS OF THE BAKER STREET AND WATERLOO, GREAT NORTHERN, BROMPTON AND PICCADILLY, AND THE EUSTON, HAMPSTEAD, AND CHARING CROSS RAILWAYS.

OTIS ELEVATOR Co., Ltd., 4, Queen Victoria Street, London, E.C.

Appointments Wanted.

The charge for Advertisements under this heading is 1s. 6d. per insertion not exceeding four lines, and 6d. per line afterwards, prepaid. Three insertions may be had for the price of two. Advertisements must reach the Office not later than 5 o'clock on Monday.

ADVERTISER (30) desires RE-ENGAGEMENT in architect or consulting engineer's office. Fifteen years' London experience in heavy construction work and preparation of specifications. Quick and accurate draughtsman. Highest references.—E. HOFF, 245, Barcombe Avenue, Streatham Hill. 1715

ARCHITECT'S ASSISTANT, good draughtsman, steady and reliable, satisfactory references; moderate salary.—"Nonconformist," Box 1712, BUILDERS' JOURNAL Office, 6, Great New Street, E.C.

ARCHITECTS.—A well-known London Quantity Surveyor is willing to take out quantities for works of any magnitude in own office, or otherwise by hour or percentage; excellent references given.—Box 1757, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

ARCHITECTURAL ASSISTANT (27) desires re-engagement. Nine years' varied London and Provincial experience. Design, details, working drawings, perspective, &c. Excellent testimonials. Moderate salary.—Address Box 1716, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

ARCHITECT'S ASSISTANT (22) requires RE-ENGAGEMENT; 5 years' London office experience; also acted as Clerk of Works; neat draughtsman, working drawings, &c.; good references.—Box 1741, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

ARCHITECT'S ASSISTANT (25), nine years' varied experience, desires re-engagement; designs, working and detail drawings, specifications, measuring and usual routine; mod. sal.—A. T., 86, Lyal Road, Bow, E. 1748

ARCHITECT & SURVEYOR'S thoroughly competent ASSISTANT desires RE-ENGAGEMENT. Eleven years' first-class provincial and London experience; good testimonials.—Box 1762, BUILDERS' JOURNAL Office, 6, Great New Street, E.C.

ASSISTANT OR MANAGER to Plumber and Decorators, or Shopfitters, or Clerk to Builders. 6 years' experience; good ability and education. Age 27.—Box 1734, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

BRICKLAYER.—Alterations, Sanitary Work, Kitcheners, Stoves, Tiling, Pointing, Slating, and Repairs. Good references; would take low wages for a regular job.—J. ALVEY, 16, Convent Gardens, Notting Hill. 1729

BUILDER'S ASSISTANT (age 20); 5½ years' practical experience; first class certificate advanced construction; knowledge of quantities, sanitary science, working drawings and details, tracings.—Box 1749, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

BUILDER'S CLERK or ASSISTANT (40) DIS-ENGAGED, long experience; drawing, quantities, measuring-up, levelling, supervision of work, &c.; country preferred.—L. J. G., 88, Adelaide Road, Shepherd's Bush, London. 1721

BUILDERS.—ELECTRICAL WIRING WORK WANTED, carcass or otherwise, by competent workman. Hour, day, or job.—E. ARNOLD, 30, St. James Road, Bermondsey, London. 1732

CONTRACTOR'S ASSISTANT or AGENT seeks ENGAGEMENT; age 27; exp. Government, municipal, and speculative work, supervision, setting out, measuring, &c.; office or works.—SMITH, 2, Douglas Road, Lewisham. 1751

FOREMAN OF PAINTERS AND DECORATORS seeks engagement. Head or working. Good manager. Steady, practical, and reliable. Colourist. Age 36. Town or country.—T., Market House, Fleet, Hants. 1731

GAS, Hot-water, Steam, and General FITTER disengaged; piece or day, own tools to 3in.; would take sub-contracts from builders; 5 years' refs.—ADAMS, 6, Follock Road, S.E. 1740

GENERAL or WORKING FOREMAN wants re-engagement; shop or outside. Conversant with allied trades. Steady and reliable; trade, carpenter and joiner.—HARRY HEMS, 7, Park Grove, Bromley, Kent. 1750

GENERAL FOREMAN seeks re-engagement; carpenter and joiner; age 33; abstainer; 5 years' good refs.—A. C. SMITH, 10, Mearley Road, Leyton, N.E. 1746

GENTLEMAN, Young, seeks SITUATION as manager of decorative business, well up in estimating, with a thorough knowledge of the trade.—Apply Box 1747, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

JUNIOR (18) seeks position in Architect, Surveyor or Builder's office. Competent draughtsman and tracer. Has had experience in Surveyor and Estate Agent's offices. Brighton or district preferred. Testimonials and particulars; A. PICKERING, Ham Farm, Beckenham. 1742

JUNIOR ASSISTANT (21) desires ENGAGEMENT. Five years' architectural and surveying experience. Capable leveller and surveyor. Abstainer. Prob. R.I.B.A. and student S.I.—Apply N., West View, Middlewich, Cheshire. 1758

JUNIOR DRAUGHTSMAN requires engagement; neat at tracings, plans, and colouring; previous experience; age 19.—Box No. 1744, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

MACHINIST (28); planers, saws, mouldings; could take charge gas or electric plant.—HENLEY, 24, Hornbye Road, St. Leonard's-on-Sea. 1760

MASON, Monumental or Building, WANTS WORK. Town or country.—A. WADSWORTH, 140, Paroes Road, Kensal Rise, W. 1743

MONUMENTAL MASON requires SITUATION (South). Good Letter Cutter and Carver. London experience. Moderate salary. Photos of work.—Box 1710, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

PAINTING and PAPERHANGING (piece-work) WANTED by practical man. Any quantity, any distance. Or as Working Foreman of Painters.—W., 117, Dunlace Road, Lower Clapton, N.E. 1711

PAPERHANGER wants PIECEWORK. Best or commons. High relief a speciality.—C. HODSOLL, 1, Medley Road, West Hampstead, N.W. 1730

PATENT FIRE-PROOF FLOORINGS.—Wanted Agency for Ireland from makers of above pavements.—Address, Box 1735, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

PLUMBING, HOT WATER, STEAM WORK WANTED.—Any quantity, anywhere. Estimates from plans or quantities.—THOS. ORSBORNE, 4, Woodlands, Isleworth, W. 1719

PLUMBER wants JOB, town or country; wages moderate for constancy; good references.—Apply W. M., 31, Stamford Road, Fulham. 1739

QUANTITIES PREPARED.—Estimates priced in competition. Variations measured and adjusted in town or country. Surveys for dilapidations, &c., by London Surveyor of large experience in all classes of buildings. Speculative prices.—SURVEYOR, 3, Finsbury Park Road, N. 1756

REPRESENTATIVE having connection with Architects and Builders in Bournemouth and district desires additional appointment for part time.—H. P. S., Southcliffe Lodge, Exeter Road, Bournemouth. 1727

SHOP FOREMAN OF JOINERS seeks re-engagement; energetic and reliable, accurate setter-out; good manager of men; well up in machinery.—H., 56, Ashville Road, Leytonstone, N.E. 1759

TO ARCHITECTS.—Advertiser (20) just finished articles with City firm of quantity surveyors, who have been engaged on important works, desires to enter Architect's Office as improver; good references.—H. P. EAMES, 18, High Street, Barnet. 1745

WORKING FOREMAN (Carpenter and Joiner) wants JOB; day or piecework. Distance no object. Abstainer. Age 30.—ORMESBY, Harrington Road, S. Norwood. 1714

WORKING FOREMAN of PAINTERS and DECORATORS. Long and varied experience; energetic and reliable; good references.—Box 1733, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

WORKING SHOP FOREMAN of Joiners requires Situation in a small Machine Shop, good reference, also good setter-out and manager of men, Age 36.—Address, T. M., 14, Hartington Road, Lower Edmonton. 1728

Drawings, Tracings &c.

ARCHITECTURAL ARTIST.—Academy Exhibitor; perspectives in line, wash, and colour for competitions, exhibitions, &c.—B., 77, Dartmouth Road, Forest Hill, S.E. 1588

ASSISTANCE rendered in the preparation of Architectural Drawings, &c., at advertiser's own address.—Box 1717, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

Appointments Vacant.

ADVERTISER requires party with small capital to join in developing Inventions for Concrete Blocks and Steelwork Casings, produced economically.—Apply Box 1736, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

ARCHITECT'S ASSISTANT WANTED; accurate in design, details, &c.—Box 1763, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

JUNIOR ASSISTANT Wanted in Marble Merchant's office; proficient typist, and quick at shorthand; one with good knowledge of drawing preferred.—Apply, stating salary required, to H. T. JENKINS & SON, The Marble Works, Torquay.

NATIONAL FEDERATION of BUILDING TRADE EMPLOYERS of GREAT BRITAIN and IRELAND.—SECRETARY REQUIRED.—The person appointed will be required to devote the whole of his time to the duties; should have a knowledge of the Trade, and capacity of organising. Further particulars can be obtained on application to "FEDERATION," 31, Bedford Street, London, W.C. Commencing salary, £350 per annum; age not exceeding 45. Applicants to state age, previous employment, and qualifications, in envelope to be obtained as above, and sent in not later than April 17th.

OPPORTUNITY for acquiring experience in DECORATIVE and WOODWORK DESIGN. Students with knowledge of colour-work and drawing from life preferred.—Apply, with specimens of work, to Studio, WARING & GILLOW, Ltd., 181, Oxford Street, W.

REPRESENTATIVES WANTED in all the large cities to undertake AGENCY for the KAHN SYSTEM of REINFORCED CONCRETE. A thorough knowledge of engineering and building construction is essential. Only the best men need apply.—TRUSSED CONCRETE STEEL Co., Caxton House, Westminster.

WANTED, a Practical DRAUGHTSMAN in a Constructional Engineer's Office; must be competent to take out strains, make calculations, designs, and details in Iron and Steel work generally, and prepare Estimates.—Reply, with full particulars, Box 1738, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

Offices & Wanted & To Let.

TO YOUNG ARCHITECTS.—Share of Architect's (A.R.I.B.A.) furnished offices adjoining Bedford Row can be acquired at nominal rent.—Box 1720, BUILDERS' JOURNAL Office, 6, Great New Street, Fetter Lane, E.C.

Businesses Wanted & For Sale.

BRICKWORKS, AS A GOING CONCERN. LOW RESERVE.—Bordon Camp, Hants. A new and rapidly growing important Military Centre. For Sale privately or by auction on April 18th, "Kingsley" Brickworks (the nearest to the Camp), comprising over 12 acres of freehold land, with an abundant supply of excellent clay. Has never been pushed, but an output of about half a million bricks has been done, and this by introduction of machinery could be greatly increased, with a ready sale always in view.—Double tenement cottage. Important road frontages. Also in separate lots 3 pairs of new and a pair of old cottages. Station (Bentley) 2½ miles, 42 miles from London. Particulars and conditions of sale may be obtained of Messrs. Hind and Sons, 28, New Bridge Street, 26 and 122, Cannon Street Road, E., and of the Auctioneer, Reginald C. S. Evennett, F.A.I., Haslemere and Farnham, Surrey.

HARROGATE.—JOINER'S and UNDERTAKER'S BUSINESS. Established nearly 50 years. Gas Engine, Planing Machine, Circular and Band Saws, &c., also Stock at valuation.—Apply TOPHAM, Solicitor, Harrogate.

Miscellaneous.

DUMPY LEVEL, 14 inches, by Troughton and Simms, staff and leather case, £8; also leather pocket case electrum drawing instruments, 15s.—AVERY, Swindon Lane, Cheltenham.

WANTED about 40,000 9 by 4½ by 1½ blue or red Vit diamond pattern paving tiles delivered Whitehaven. Quotations to L. FERGUSON, Builder, Harrington, Cumberland.

WANTED Sliding Armoured Fire-resisting DOORS for Square-cornered Openings. Second-hand; small sizes.—BURTENSNAW, Architect, Hailsham, Sussex.

Hooking the Client. THE ways in which architects set about the first essential of their practice are often rather peculiar. There are, of course, many ways of securing clients and conducting business negotiations, but we cannot attempt to enumerate them all. Certain instances, however, may be given for the benefit of the younger men, who sometimes regard the success of their older confrères with wonderment. Many, no doubt, look upon it as due to exceptional influence, and although they themselves may also possess influence of a kind, yet, somehow or other, they do not manage to secure work. The client rises to their bait, but, alas! they cannot hook him. Nevertheless, they very often stand just as good a chance of securing a commission as older architects, except that they lack experience, both in business aptitude and professional qualifications. A good deal of work comes to the older men from their having already executed buildings. These advertise the architect by

attracting the public, many of whom, if they see a building which they like, will enquire the name of the architect. The public generally judge from the appearance of the completed building, and do not possess the knowledge to enable them to judge of the ability of the man. The result is that there are many architects practising in a large way who have secured their position by natural progress from one large job to another, and are dealing with schemes quite beyond their abilities, the work devolving on highly skilled assistants. We all know instances of men who leave everything to their managers, and merely deal with the clients. As a rule, however, the first chance an architect gets comes in one of two ways—by the influence of family connections and friends, or the winning of competitions. In dealing with their clients some architects adopt the “hail fellow well met” style, others the impressive manner and far-away look, some the more practical manner of the linen-draper's assistant when displaying goods, and some the “arty” manner. All these separate manners no doubt have their effect upon certain temperaments, but they are certainly not suitable to go through life on. Some architects of perhaps less distinctive temperament pass easily from one manner to the other in the endeavour to suit different clients, and generally end in making buffoons of themselves. These are the snobs of the profession. They toady to the influential client, and act tyrannically to those under them. Others think it desirable to ignore all methods, or perhaps they do not think of the matter, though this practice is not particularly commendable. Architects, of course, have to deal with all classes of the community, and no doubt some of the above enumerated methods suit certain people, but, for our part, we think there is a middle course which will satisfy every circumstance, and one which it is not impossible to instil into the minds of students. We recognize that in commerce a man must be businesslike. The term is wide in its meaning, but its general significance is understood. The architect is expected to deal with business matters, and, consequently, he should be a business man. When clients come to him they expect that he shall, sensibly and reasonably, give them what they ask for. They do not come to him as a personal friend, but as a business man; and they expect him to talk business from the first. Perhaps, however, this is not quite a correct statement, because the majority of commercial men look upon the architectural profession as a body of unbusiness-like men with whom one must perforce deal, and they come more or less prepared for the worst: the low esteem in which the profession is held by the public is undoubtedly traceable to this. Architects have to deal with their clients' money, and yet in many cases they hardly understand the rudiments of commerce. A client starting to build

never knows what his house is going to cost, and it is an admitted axiom among the public that the cost will be exceeded by one-third to three times the figure estimated. Doubtless, every client makes alterations that increase the cost, and the architect probably has an idea that it is not to his advantage to warn his client. In the end, however, we consider this to be a disadvantage. Engineers are very differently esteemed, although paid on the very same commission basis as architects.

The Registration Meeting. THE meeting which was held last Tuesday week to consider the report, appendix and memorandum of the Institute Registration Committee passed off very harmoniously, and a definite step was taken towards the settlement of this vexed question. The meeting came to two unanimous resolutions: (1) “That the general principles of the report and recommendations of the Registration Committee, dated March 20th, 1906, be adopted and the details referred to the Council for further consideration and report to the general body”; and (2) “That the Council be requested to take the necessary steps, when the scheme in accordance with the first resolution is perfected and approved by the general body, to apply to His Majesty the King for a revised or supplemental charter, and to prepare and present a Bill to Parliament.” The general feeling of the meeting seemed to be that such an important matter could not be properly dealt with in any hurry. Several points of objection were raised, as was only natural, but the prevailing opinion was that these could be settled at a later stage, after the general principles had been agreed to. Some members expressed objection to altering the title of the Institute to “The Royal College of Architects,” while the suggestion hinted at in the report that the pupillage system should be done away with, and schools substituted, also did not meet with favour. Regarding the new class of licentiates which is proposed to be formed, Mr. G. A. T. Middleton said very much the same as we did last week, namely, that it would be necessary to consult those who wished to be admitted. At the present time it would be found that there were not very many who would care to join the Institute in a lower rank than that of the Associates, without power to vote; those who were of any standing at all—the very men one would like to draw into the Institute—would not thereby be drawn. Some other means might be found. We make the suggestion that the term “associate members” might be used instead, if three classes are to be adhered to, or we think it would perhaps be better to call the Associates Fellows at once, giving the new class the title of Associates, and honouring the members in the present fellowship class by giving them the title of Honorary Fellows.

ELMBANK STREET.

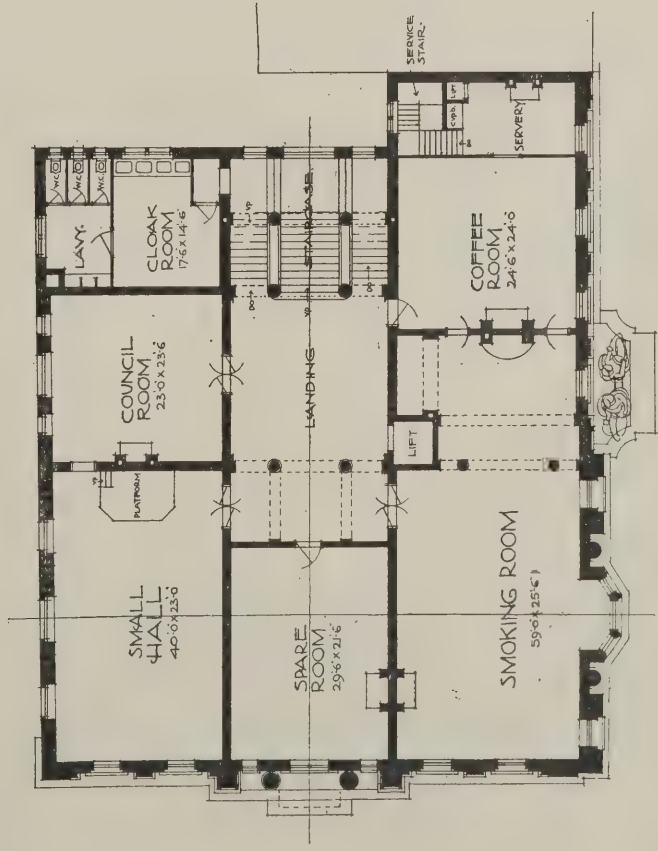

SECTION A-A.

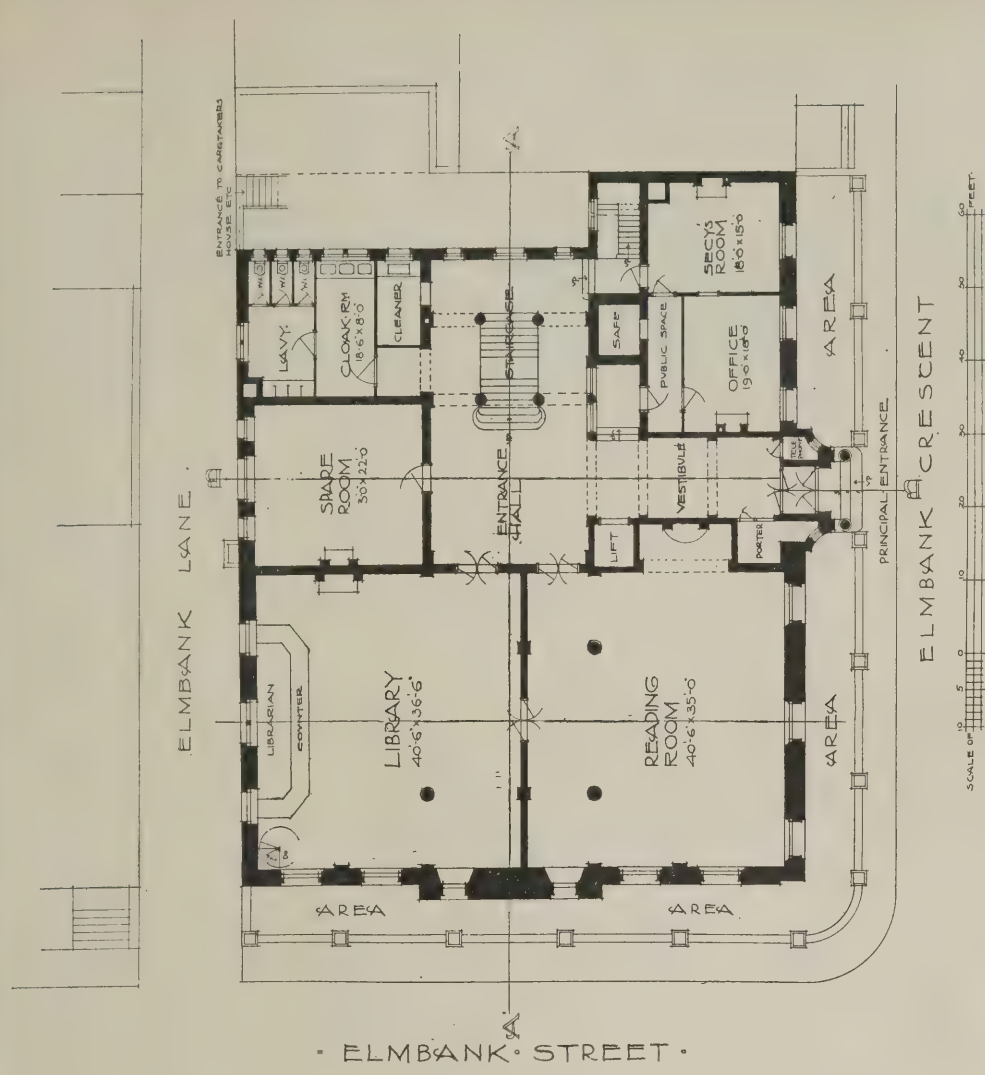

SELECTED DESIGN FOR NEW BUILDING OF THE INSTITUTION OF ENGINEERS AND SHIPBUILDERS IN SCOTLAND, CORNER OF ELMBANK CRESCENT AND ELMBANK STREET, GLASGOW.
JOHN B. WILSON, A.R.I.B.A., I.A., ARCHITECT.

Second-floor Plan.

First-floor Plan.

Ground-floor Plan.

In this competition, just decided, the design placed first by the assessor (Mr. G. Washington Browne) was that of Messrs. Mitchell & Whitehead, but the Institution Committee adopted Mr. Wilson's design, placed second, as being, in their opinion, more commodious and suitable to their purposes. The estimated cost of the building is £25,500. The external walls will be faced with white freestone, and the construction throughout will be fire-resisting. A liberal use of marble in flooring and decoration is intended.

NORTH ELEVATION.

SOUTH ELEVATION

WALLSEND MUNICIPAL BUILDINGS COMPETITION.

IN this competition, just decided in favour of Mr. J. H. Morton, F.R.I.B.A., of 50, King Street, South Shields (whose design was awarded the first premium), the scheme was to provide a building giving complete accommodation for the comparatively small sum of £11,500. The problem has been satisfactorily solved. In the plan here reproduced the municipal portion is placed on the High Street front, the court building being to the south, with entrances from Lawson Street (where also, at one corner of the site, is the fire-station), leaving ample room for a future town hall on the Coach Road front. The keynote of the planning is the position of the council-chamber, on the first floor, and the police-court, beneath it, the council-chamber being approached from the main entrance hall by a roomy staircase, through an ante-room. As in planning municipal buildings the offices most frequented by the public should be more easily accessible than the others, the offices of the borough surveyor, borough accountant, rates offices, registrar and relief offices are all on the ground floor. The grouping of them is best seen from the plan. The registrar's office and relief station both have direct external entrances, as it is found best for them to be given the least possible access to the more important corridors and entrances. The court building is approached through an entrance hall lighted by a cupola. A separate entrance is planned through the municipal buildings to the magistrates' room, and access to the entrance hall of the court is also provided from the corridor of the municipal buildings. Access to the public gallery is from the rear, and a separate entrance is arranged for prisoners from an enclosed yard to the detention rooms in the basement, with stairs leading to the dock in the police-court. The council-chamber above is barrel-vaulted, and is divided from the public gallery by an arcading of three bays: the gallery will seat more than 100 persons and is approached from Lawson Street. Special care has been taken in providing a commodious suite of committee-rooms.

FIRST-PREMIATED DESIGN FOR WALLSEND MUNICIPAL BUILDINGS.
J. H. MORTON, F.R.I.B.A., ARCHITECT.

Correspondence.

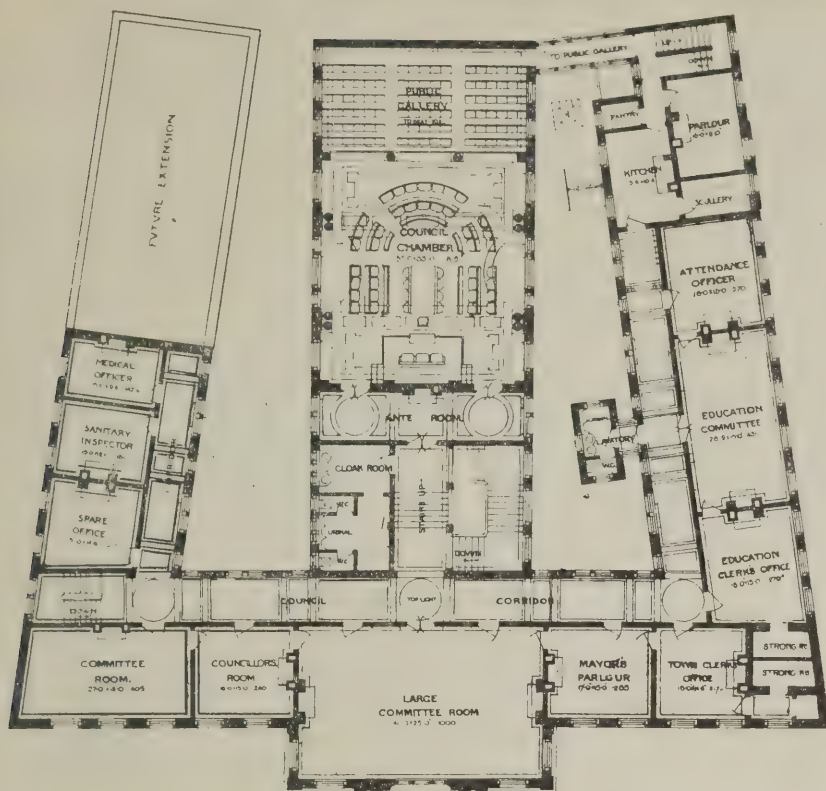

Action of Plaster-of-Paris on Iron.

To the Editor of THE BUILDERS' JOURNAL.

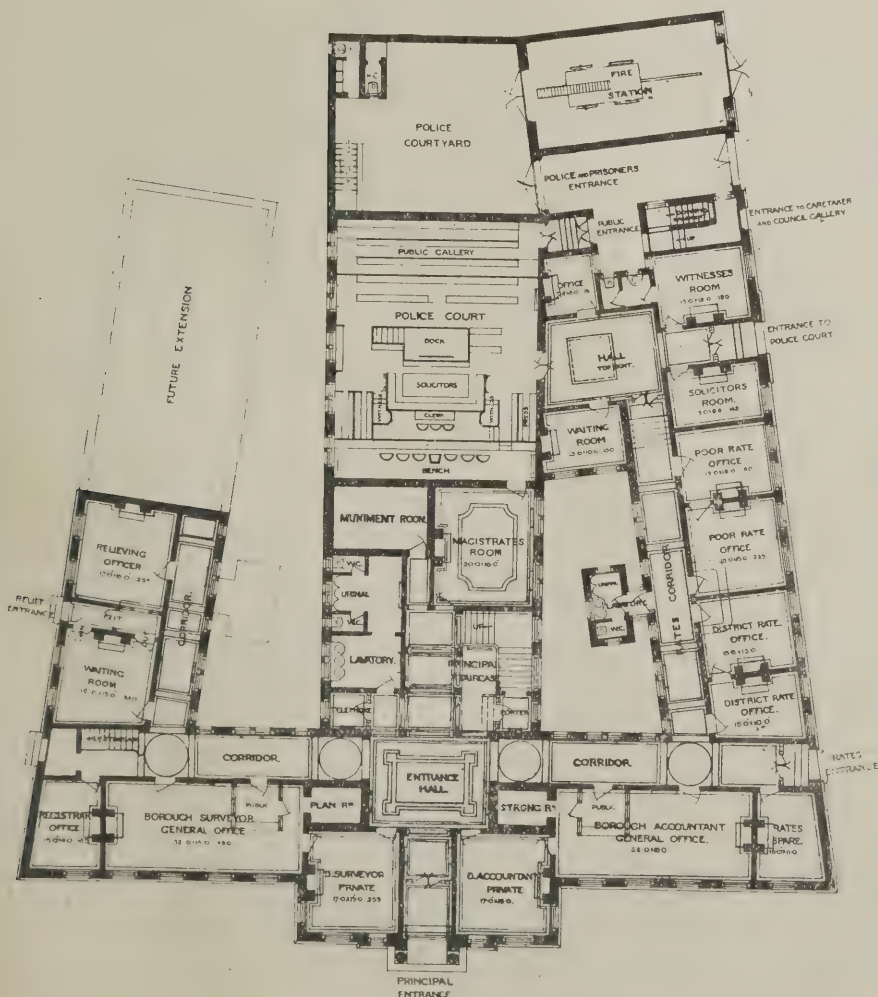

SIR,—May I venture to make one further contribution to the correspondence on this interesting subject, under a promise that it shall be my last. Dealing with your able exposition of Calvert's theory as to the rusting of iron in your issue of March 21st, I think few will be found to uphold longer the contention that the presence of carbon dioxide is essential for the rusting of iron in moist air since the publication of the careful work of Professor Dunstan and others (see Proc. R.A. Inst., Woolwich, 1899; Proc. C.S., 1903; and Trans. J.C.S., 1905), in which the authors have definitely shown rusting to take place in the absence of carbon dioxide. At the same time the presence of this gas certainly aids oxidation. Further, the contact of alkalis with iron, as you point out, has certainly a preserving effect, but this appears to be due not to the absorption of carbon dioxide, but to the inhibiting effect of alkalis on the formation of hydroxyl groups which act upon the iron, the rust formed not possessing the simple formula Fe_2O_3 as you suggest, but being certainly a hydroxide of iron, probably with some such formula as $Fe_2O_3(OH)_2$. Again, the impurities in commercial iron must play a large part in the rusting process in the presence of moisture, when electrolytic action will be set up.—Yours truly,

ALAN E. MUNBY.

[We did state that rust was hydrated oxide of iron, but went on to say that the ferrous carbonate which was first formed decomposed to ferric oxide. We might have added that in the presence of water this becomes hydroxide of iron. Mr. Munby refers to the researches of Professor Dunstan, Dr. Jowett and Dr. Goulding, and quotes their suggested formula for iron rust, $Fe_2O_3(OH)_2$. This supposes that the iron is in a ferrous condition, but they themselves show that the rust which forms under practical conditions is in the ferric condition. Other authorities, too, support this; several writers giving it the formula $Fe_2O_3 \cdot Fe_2(OH)_6$. Prof. Wilhelm Ostwald regards it simply as hydroxide of iron with the formula $Fe(OH)_3$. This can be stated as hydrated ferric oxide, thus $Fe_2O_3 + 2H_2O = 2Fe(OH)_3$, the reversal of which equation, indeed, takes place on heating, the hydroxide being decomposed into ferric oxide. Mr. Munby's formula may also be stated as $Fe_2O_3 \cdot H_2O$. The researches of Professor Dunstan and his co-operators which led to the promulgation of the theory that rusting was due to the formation of peroxide of hydrogen or hydroxyl groups were laboratory experiments that had no similarity to actual practical conditions. Their analysis of the rust thus produced showed the iron to be mostly ferrous, but their analysis of the rust produced under practical conditions showed the iron to be mostly ferric. This they trace to the further oxidation of ferrous oxide in air. At the same time their laboratory experiments showed that the rust produced by carbon dioxide was of such similar composition to the rust produced naturally that we do not think they were at all justified in stating that the product was very different and in concluding that carbonic acid plays an unimportant part in atmospheric rusting. We contend that their theory was very far from proved and that Calvert and Crum Brown's theory still holds good. The inhibiting effect of alkalis on the formation of rust we maintain is due to the neutralization of carbonic acid. Those who care to pursue the subject further should refer to the criticisms of Dr. G. T. Moody published in the proceedings of the Chemical Society for 1903, which, in our opinion, undermine Prof. Dunstan's theory, although

he has sought to meet these criticisms when repeating his theory in the Journal of the Chemical Society for October 1905; the history of his efforts in this direction is only another instance of the fact that chemists seem unable to appreciate the practical problems of construction and to design their experiments in conformity therewith. The reason is that they have little or no knowledge of the phenomena familiar to practical men; though the latter are not generally able to interpret them because they lack the scientific training.

— Ed. B.J.]

DRAWINGS OF BAMBERG.

THE three drawings of Bamberg reproduced in this issue are good examples of Mr. H. Wilson's draughtsmanship. The originals were drawn, we believe, on brown paper, the high lights being skilfully put in with white chalk. Of the three, perhaps that reproduced on this page is the best. Bamberg, it may be mentioned, is a town in Bavaria, not far from Nuremberg. It has a very fine Byzantine cathedral, originally built early in the eleventh century and rebuilt, after a

fire, about a hundred years later. This building contains the tombs of the founder and his empress Cunigunde, Conrad III. and Pope Clement II., and is embellished with numerous paintings by eminent masters. Other prominent buildings in the town are St. Martin's Church, the palace, the townhouse and the theatre.

At Letchworth (Garden City) the "Mrs. Howard Memorial Hall" has been built at a cost of £1,100 from designs by Mr. Raymond Unwin, the estate architect.

BAMBERG: VIEW FROM BRIDGE. DRAWN BY H. WILSON.

BUILDING LEGISLATION.

A Comparison of English and American Laws.

By Horace Cubitt, A.R.I.B.A., P.A.S.I.

(Concluded from p. 153, No. 580.)

IN Boston walls reinforced by an iron or steel framework are allowed, in the case of external walls, to be of less thickness than that specified for ordinary brick walls, provided that such walls meet the requirements of the Act as to strength. Party-walls in first- and second-class buildings must be of brick, and must be carried up to the height of joins. above the roof, but in the case of buildings not over 45ft. high 12ins. above the roof is considered sufficient. Where openings or recesses occur in an external wall their extent is limited only by the provision that the piers must be of sufficient strength to comply with the section fixing the maximum load allowable on various materials; the panel walls, however, may not be less than 12ins. thick in buildings under 70ft. high, or less than 16ins. thick in buildings 70ft. and more in height. The question of recesses and openings in external walls seems to be very well dealt with in this manner.

Some requirements, such as those concerning recesses and openings in party-walls and the construction of fireplaces and chimneys, are not dissimilar to those of the Model By-laws; but the external brickwork of chimneys must be 8ins. thick unless the flues are finished with terra-cotta linings, and in the case of party chimney stacks the provision of these linings is compulsory. The junction of walls at any angle in the first- and second-class buildings is required to be assisted by wrought-iron ties at roft. vertical intervals. Presumably the brickwork is also bonded, and although the iron ties must provide additional strength I am not aware that this method is customary in any class of buildings in this country.

Construction of Floors.

The construction of floors, both "new and renewed," must be carried out in accordance with very detailed provisions—a contrast to the regulations of the original Model By-laws, where the question of strength is not even mentioned. In Boston the floors of every building are required to be so constructed that they will carry safely the weight to which the proposed use of the buildings will subject them. The least capacity per square foot, exclusive of materials, is given as—floors of dwelling-houses 50 lbs., office buildings 100 lbs., public buildings 150 lbs., warehouses 250 lbs. As will be seen, these data are considerably less than those in use for the construction of ordinary buildings in this country, and thus the regulation as to strength just referred to can hardly effect the erection of buildings of sound construction, while still keeping the jerry-building fraternity within reasonable bounds. It is also stated that every building built or altered after the commencement of the Act must have posted in every room used for mechanical or mercantile purposes the building commissioner's certificate of the weight-bearing capacity of the floor, which capacity must not be exceeded.

Roofs and Elevator Shafts.

The strength of "new and renewed" roofs has also to be in accordance with the specified municipal requirements, and the construction of elevator shafts is not allowable unless "some substantial material not inflammable" is used, and existing shafts (except those 28ins. square, or less, and those in ordinary dwelling-houses) must be rendered non-inflammable on the inside.

Means of Escape from Fire.

The question of means of escape in case of fire, both from new and existing buildings, is

dealt with in a much more drastic fashion than in the Massachusetts building laws, previously referred to. "Every building hereafter built" and every building occupied by two or more families, or as a tenement, boarding or lodging-house, or as a factory or workshop, is required to have with reference to its height, construction, surroundings, character of occupation, and number of occupants, sufficient means of egress in case of fire "satisfactory to the building commissioner." In all new buildings two storeys or more in height, and in all existing buildings, other than ordinary dwelling-houses and small mercantile premises, there must be provided "two independent and sufficient ways of egress." Any person responsible for the condition of a building is entitled to a certificate to the effect that the building is provided with safe means of egress.

The regulations dealing with the construction and means of escape from theatres are, both in Boston and New York, of a very detailed character; but as, again, this branch of my subject is quite sufficient for a separate article, and as it is hardly of general interest, there will be no attempt to go further than to state the existence of not very dissimilar regulations to those in force in London. With regard to New York, however, I may mention the interesting requirement that a diagram plan of each tier, gallery or floor, showing the exits, must be printed on the programme of the performance.

Alterations to Existing Buildings.

It will have been noticed that in several instances in Boston existing buildings are dealt with. These, as in England, are of course often under leases, and a clause has been inserted in the Boston building laws to enable a lessor who may have had to spend a considerable sum on his premises to collect an extra rent from the lessee. It is stated that "in the case of any alteration not in the nature of ordinary repairs being required under the terms of this Act upon a building wholly or partly under a lease containing no provision for such a case, the owner shall pay the expense and may collect of the lessee an additional rent for the portion so leased equal to 8 per cent. per annum on that proportion of the sum paid which the leased portion bears to the whole building."

From this summary of the Boston building laws it will be seen that the requirements are in great contrast to those of an English provincial town based upon the Model By-laws. The contrast is in this case much more marked than when, as will now be attempted, a comparison is made between the New York Building Code and the London Building Acts.

New York Building Code.

As in several respects the New York Building Code is very similar to the Boston building laws, it will not be necessary to mention in detail requirements which can be much more easily dealt with by reference to the Boston code. We again meet with defined limits, styled fire limits, within which only small specified frame buildings are allowed to be erected. The building code is administered by three commissioners of buildings, there being one commissioner for the boroughs of Manhattan and the Bronx, one for the borough of Brooklyn, and one for the boroughs of Queens and Richmond.

There is the right of appeal from a commissioner's decision in any case where the amount involved in such decision exceeds 1,000 dollars. In the boroughs of Manhattan and the Bronx such appeals must be taken to a Board of Examiners consisting of nine members representing the official, industrial and building interests. In the boroughs of Brooklyn, Queens and Richmond appeals must be taken to the Board of Buildings, of which body the three commissioners of buildings are the only members. In both cases

the decision is stated to be final. It is to be feared that the Board of Buildings, consisting as it does entirely of officials, can hardly be expected to take an entirely impartial attitude; the constitution of the Board of Examiners, however, does not meet with this objection and is not very dissimilar to that of the tribunal of appeal brought into existence by the London Building Act, 1894.

In contrast to London, where in ordinary cases plans need not be submitted, although they are required in all our provincial towns, plans in New York have to be deposited in all cases of the erection of new buildings or the structural alteration of existing ones. Some structural details are also required, and no work is allowed to be commenced until the plans are approved.

As in Boston, buildings of a certain size and class are required to be erected of fire-resisting materials. All new buildings over 75ft. high and those over 35ft. high which are to be used as hotels, lodging-houses, schools, theatres or similar buildings are to be thus constructed. It is to be noticed that wood floors if pugged are considered to be of fireproof construction.

Non-fireproof buildings five storeys in height, erected or altered for use as tenement or apartment houses to be occupied by one or more families on any floor above the first, must have the first floor above the lowest storey constructed fireproof. When any such building exceeding five storeys in height has a store on the first storey, the entire second-storey floor shall also be constructed fireproof, and if the building exceed six storeys, or 75ft. in height, both the first- and second-storey floors must be constructed fireproof. A non-fireproof building of this class may in no case exceed seven storeys, or 85ft., but if constructed of fireproof materials it may be 150ft., or not more than twelve storeys, in a street exceeding 79ft. wide, but not more than 125ft., or ten storeys, in a street less than that width. No building exceeding 100ft. in height may be less than 40ft. in width.

Height of Buildings.

The height of buildings erected under the New York Building Code is measured from the curb level to the top of the roof beams in the case of flat roofs, and to the average of the height of the gable in the case of high-pitched roofs, whereas under the London Building Act, 1894, it is measured to the top of the parapet or to the base of the gable. The height of buildings in New York is almost proverbial, but few people can be found to state that an increase in the present limit of height for London buildings would in any way be for the good of the community.

Cubic Contents.

The regulations limiting the cubic contents of buildings will, I think, appear to us not to err on the side of safety. Warehouse buildings in London are not allowed to exceed 250,000 cub. ft., except by the consent of the Council in certain cases, where an extent of 450,000 cub. ft. may be allowed. In New York non-fireproof buildings, in accordance with their situation on the frontage or at the corner of a street, may extend to from 8,000 to 12,500 super. ft. When it is realized that the buildings may in ordinary cases considerably exceed rooft. in height it is seen that, to our mind, an enormous cubic capacity is allowable. These figures only refer to non-fireproof buildings, there being no limit in New York as to the area of fireproof buildings. The allowable area of buildings in Boston has been previously referred to, and while this subject is under consideration it may be of interest to note that there is no provision whatever in the Model By-laws to regulate the cubic capacity of buildings. It does not appear unreasonable to suppose that an outbreak of fire has

much less chance of becoming dangerous if the extent of the building in which it occurs is limited.

It may be remembered that the Baltimore fire of less than two years ago originated in a building of a cubic capacity of about 1,000,000 cub. ft.—four times that allowed by the London Building Act, 1894. The fire thus obtained such an extensive hold that it was impossible to prevent the adjoining buildings becoming involved, with the well-known disastrous results. In this matter of the limitation of excessive cubical extent I think it will be agreed that our methods in London are much preferable to those current in the United States.

Window and Door Openings.

When we consider the laxity prevalent in the limitation of cubical extent, the strict regulations in New York for the prevention of the spread of fire through windows and door-openings are in striking contrast. An attempt to obtain powers of a similar nature in London was made recently in that part of the amendment to the Building Act which was not proceeded with. A justification for such an attempt may be considered to be found in the fact that several comparatively recent fires on a considerable scale, notably the one of a few years ago in Cripplegate, would have been confined to a much smaller area if similar regulations to those in New York had been in force. In that city every building more than two storeys above the curb-level, except dwelling-houses, schools and churches, must have iron blinds or shutters to every exterior window or opening above the first storey if there is another building within 30ft. of such openings, and the shutters or blinds must be closed at night. The shutters may be constructed of pine if made of two thicknesses and covered with tin, or other suitable protection of openings may be provided if sanctioned by the authorities; and fireproof buildings are allowed to have inside shutters.

The stated distance of 30ft. does not seem to be too much, for in the Barbican fire of a few years ago the flames leapt the street, which was more than 40ft. wide, and attacked the houses on the opposite side.

General Construction.

It is when the subject of general construction in detail is touched upon that we find the most considerable difference between the New York Building Code and the London Building Acts. In London the regulations dealing with the construction of ordinary buildings, other than those fixing the minimum thickness of walls, are very largely confined to the prevention of the spread of fire—the construction of hearths and flues, the heights to which party and external walls must be carried above the roof, and other such like requirements. In New York, however, not only are these matters dealt with in a very similar manner, but also the details of the construction of foundations, walls, floors and roofs have to be carried out to comply with the tabulated safe capacities of the particular materials used. The bearing powers of soils are given, and also the proportion of the live load, varying in accordance with the class of building, which has to be added to the dead load to enable the total weight resting on the foundations to be obtained.

The code also contains several pages of specification and formulæ for constructional iron and steel work, and as a whole it may be stated that on the subject of regulations dealing with construction it is hardly possible to compare the building legislation of London with that of New York. Our methods probably do not tend to such scientific construction, but individuality is given more scope; and although it may be desirable for there to be more control exercised over the operations of jerry-builders, yet the

authorities in New York appear to have gone to the other extreme.

Walls.

Some of the few requirements which are able to be contrasted with those in London are possibly of interest. It is stated that walls may be of less thickness than specified if the same amount of material is used in piers and buttresses; that hollow walls may be constructed of the same quantity of material as if they are built solid, both of these being of course different to the requirements of the London Building Act. In one case the rather curious term of "fore and aft" wall is used; if this had occurred in our London Building Act it would rather naturally have been put to the credit of the predominant naval element existing in the fire brigade.

The question of the construction of elevator shafts, iron and steel skeleton buildings, and the erection of frame buildings outside the building limits, has been dealt with in connection with the Boston building laws, and as these matters are treated in a very similar manner in the New York code it will not be necessary to again refer to them except in connection with a final review.

Conclusions.

Without, I trust, going into unnecessary detail an attempt has thus been made to give a fair general outline of typical regulations concerning buildings in the United States, with a brief comparison with those in this country, and in conclusion the main points of interest may be summarized.

In one noticeable instance it is seen that the American regulations are less stringent than our own, buildings being allowed to be erected outside the building limits of a class that would not be sanctioned even in the outskirts of an English provincial town. We can hardly venture to state in the face of present-day criticism that in this respect our requirements are as reasonable as those current in American towns.

In many other instances, such as the compulsory fireproofing of certain buildings, the provisions of means of escape, and the detailed regulations for safe construction, the American requirements are of a much more far-reaching character than our own. It must be admitted, however, that in some cases, as for instance those regarding the erection of steel skeleton buildings and those regulating the proportion of piers and recesses in brick walls, the requirements appear to be founded more in accordance with scientific construction, and are consequently of a less hard-and-fast character. If there is one point in particular more noticeable than another in the contrast between the building legislation of the two countries, it is the great prominence given in the American regulations to the provision of theoretically safe construction.

It is of interest to note that in the case of the American building legislation quoted in this paper there is not the long list of buildings and companies exempted, which, especially in the London Building Acts, is such a common feature of similar legislation in this country. The only buildings specially stated to be exempted are those which are the property of the United States.

Architects and surveyors in the course of their career may have to adapt themselves to very different circumstances. To some extent in our large towns and cities the conditions of life are tending towards those prevalent in the United States, and it can hardly be doubted that if this continues, in twenty or thirty years' time our building legislation will have altered in the same direction. It is certain that we cannot lose by knowing a little about the building conditions of those whom in these days of quick locomotion may almost be styled our neighbours, and it is more than probable that we ourselves may have to face not very dissimilar problems.

KING EDWARD VII. SCHOOL, LYTHAM.

IN illustrating this school in our issue for last week the name of Mr. Arnold Thornley, A.R.I.B.A., should have been included with Messrs. Briggs & Wolstenholme, F.F.R.I.B.A., as the architects.

The following particulars reached us too late for inclusion in our last issue:—

The buildings are placed on the north-east portion of the site, with the playing fields to the south and west. By this arrangement an opportunity is given to interpose belts of trees between the buildings and the south-westerly gates. The site is proposed to be laid out with cricket field and Association football grounds to the south, and Rugby and hockey grounds to the west. The plan is practically a balanced one, with the various buildings grouped round a closed quadrangle 312ft. long by 132ft. deep. The entrance to the quadrangle is centrally placed under the clock tower on the north elevation and the various departments grouped as follows:—To the south the educational portion of the school proper with central assembly hall and classrooms; to the west lavatories, changing rooms, latrines, play- and reading-rooms, woodworking shop and gymnasium; to the north the remainder of the workshops, bicycle-room adjoining main entrance, museum and governor's room, and library with the necessary cloakroom, &c.; to the east, centrally placed in the quadrangle, the dining-room with kitchen adjoining, and the boarding house for thirty-two boys at the south-east corner, with masters' private house on the north-east. The science rooms are placed on the first floor over the main entrance and cloakrooms, &c., adjoining the upper portions of the assembly hall, and the music rooms are arranged to the south of the assembly hall and are completely isolated from the school. The north-lighted art room is placed over the large classroom at the extreme end of the southern wing, and has its own separate staircase. The boarding house is planned with the dormitories and sick rooms on the first and second floors. The headmaster's house is arranged with the private bedrooms on the first floor and the servants' bedrooms on the second floor, approached by a second staircase. The easterly side of the quadrangle is formed by grouping the three departments—masters' house, kitchen department and boarding house, and, whilst each is distinct in itself, intercommunication is readily secured by a connecting corridor. The kitchen is practically isolated and is planned with its own yard, masked from St. Paul's Avenue by a protecting boundary wall with private entrance for tradespeople and carts. The latrines are placed at the west extremity of the classroom corridor outside the quadrangle, as also the exit to the playing fields beyond; here also are grouped the five-courts. With the exception of two, all the classrooms face south and are on the ground floor. The changing rooms are arranged to allow 150 boys to change at the same time. The accommodation is as follows:—Large hall to seat 700 or 800 people; seventeen classrooms, varying from twenty to fifty boys, and giving room for 510 boys altogether; chemical laboratory and physics laboratory to accommodate thirty boys each; and lecture room for fifty boys.

The style adopted is a simple treatment of late Renaissance as being eminently suited to a building of this description, allowing, as it does, of the maximum window space. The buildings are to be faced with red bricks and the dressings of stone, the roofs to be covered with Coniston green slates. The interior woodwork will be of American whitewood, stained green and varnished. The estimated cost of the complete scheme is put at about £50,000.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Architectural Association was held on Friday evening at 18, Tufton Street, Westminster, the chair being occupied by the president, Mr. E. Guy Dawber, F.R.I.B.A.

Messrs. P. J. D. Webster, A. V. Sutherland Graeme and W. W. Diggle were elected members of the Association, and the re-instatement of Mr. R. P. Bruce was announced. It was stated that the following further donations to the Building Fund had been received:—

	£	s.	d.
James Boyd & Sons	-	-	25 0 0
Hippolyte J. Blanc	-	-	3 3 0
A. Ebbs	-	-	1 1 0
W. Petch	-	-	1 1 0
E. E. Cronk (double subscription)	-	0	10 6
R. Hunter	-	0	10 6
C. W. Piper	-	0	10 6
H. D. Searles-Wood	-	0	10 6
G. Sherrin	-	0	10 6
A. Whitelaw	-	0	10 6

The president read a letter from R.I.B.A. stating that the council would grant exemption from the Intermediate Examination of the Institute to those students of the A.A. who had passed through the four years' course of the A.A. schools in a manner satisfactory to the Board.

A paper on "Valuations, Compensations, and Light and Air" was then read by Mr. E. Greenop, A.R.I.B.A.

Valuations.

When valuing existing buildings, he said, it was necessary of course to possess the knowledge to enable one to estimate with accuracy the probable cost of repairs, the deductions for rates, and a deduction for possible loss of rent, and similar contingencies. It was not unusual to see 10 per cent. upon the gross rental value deducted for repairs, but the experienced valuer preferred to take each case on its merits. A stuccoed house, for instance, requiring painting externally every three or four years would obviously necessitate a much larger annual average outlay than a red brick-faced house of the same size; again, the age of the property, the class of tenant, and other such considerations might vary the conditions materially.

After determining the nett income, the most important matter had to be decided upon—namely, the number of years' purchase to be applied as a multiplier; in other words, the percentage an investor would require during the term in question, in addition of course to getting back his capital. Here the tables were of service, so far as mathematics were concerned, but as regards the proper percentage to adopt, that would have to be settled for every particular case. On a house, say, in Belgrave Square an investor would be content—indeed, would have to be content—if he could see, say, 4 per cent. for his money, whereas with an inferior East End weekly property the expectation of 8 per cent. or even 10 per cent. could be justified, the one being well assured and the other more or less precarious.

Valuations of property perhaps more often arose out of mortgage proposals than for other objects. Here care had to be exercised, as also when the money to be lent was derived from trust funds. Trustees are precluded by Act of Parliament from lending upon leasehold property having less than sixty years unexpired.

Compensations.

Turning to compensations, Mr. Greenop said these usually arose out of the formation of and additions to railways, the widening of roadways, the acquisition of land for schools, drainage, &c. The proceedings were governed mainly by the Land Clauses Acts, which were generally incorporated with the special Acts obtained by the various bodies acting as promoters. The claimant could

elect to go to arbitration or before a jury of laymen; he generally chose the latter.

The ordinary principles of valuation applied to compensation cases. It was usual to add 10 per cent. to the actual value as the recognized solatium for having to part with property against one's will.

Light and Air.

Dealing lastly with light and air cases, Mr. Greenop said these were the most unsatisfactory with which surveyors had to deal. The proceedings were usually long-drawn-out, and it was difficult to get the case properly appreciated without models and visits to the premises, which were costly matters. In the end the parties were probably far worse off than if they had settled their differences out of court.

Mr. Greenop said he always endeavoured to get these cases referred to a surveyor as sole arbitrator. It was a comparatively inexpensive method of dealing with the dispute, and it was generally speedily settled.

The earlier decisions laid it down that in order to obtain redress for interference with light one had to show the interference to be of sufficient importance to amount to a nuisance, but the important case of *Home and Colonial Stores v. Cols* had altered the matter. In this case, too, one of the lords justices in his judgment spoke approvingly of the value of the angle of 45 degs. as a test, and thereby gave a new lease of life to it. It might not be very accurate or scientific, but it was very convenient and time-honoured. It was also readily understood by laymen.

In conclusion Mr. Greenop referred to the Bill promoted several years ago, with the combined aid of the Royal Institute of British Architects, the Surveyors' Institution and certain eminent lawyers, for the purpose of dealing with light and air matters on the lines of Part VIII. of the London Building Act, which dealt with party structures. A private Bill of this nature, however, was not hurried in Parliament, and a long time was likely to elapse before it passed into law.

Mr. W. Woodward proposed a vote of thanks to the lecturer, which was seconded by Mr. Max Clarke and supported by Messrs. Louis Jacob, Leslie W. Green, Matthew Garbutt and R. S. Prideaux.

The president announced that the next meeting of the Association would be held on April 27th, when a paper on "Fenestration" would be read by Mr. Walter Cave.

THE INTERCEPTING TRAP.

A Condemnation.

IN the twenty fourth annual report of the Bradford Sanitary Association the engineer, Mr. Malcolm Paterson, M.I.C.E., F.G.S., refers to Dr. Butler's paper on the intercepting trap, read recently before the Royal Sanitary Institute. The doctor's conclusion was that the intercepting trap was a failure, and Mr. Paterson agrees with him. He says: "The device was the product of theory into which practical considerations did not enter, and, in short, was adopted by the Local Government Board with unusual celerity, and put into those Model By-laws which are more honoured in the breach than in the observance. It violated every canon of drainage practice. It interfered with the swift passage of solids to the outfall; it interfered with the current of ventilation; it put a resting place for the solids in each house system, making so many small sewer-gas producers; it created vents on ground level at the thresholds of the houses and the gardens, whence at each closet flush foul air was driven out; it choked entirely a large percentage of drains; and finally it intensified both the poisonous quality of the sewer air and its pressure upon the ordinary house sink gulleys, when, in spite of the

locking off, it did reach them, as it often did. Yet, despite these violations of common sense and natural laws, it was upheld by the Local Government Board and by a large superfluity—it cannot be called weight—of official authority. Brought in hastily as a royal road to security, it has taken long years of leisure for repentance, and the first officials to realize the mistake have been the surveyors of those districts which had adopted it, who, as the practice increased, discovered the extraordinary difficulties it placed in the way of the adequate and secure ventilation of the sewers; at the same time that it induced a more dangerous and offensive state of the disconnected drains."

Notes and News.

The Surveyors' Institution will hold a provincial meeting at Birmingham on May 24th and 25th.

Sutton-in-Ashfield Congregational Church has just been completed at a cost of £3,982. Messrs. G. Baines & Son, of 5, Clement's Inn, Strand, W.C., were the architects and Mr. J. Greenwood, of Mansfield, was the contractor.

The Society of Ordained Surveyors held its eighth annual general meeting on Friday last at Edinburgh. The report of the General Examining Board stated that in the preliminary examinations held during the last year twelve candidates presented themselves, six of whom passed in all subjects; while in the final examinations three candidates came forward, one passing.

The York Minster Buttresses.—The work of fixing the flying buttresses and pinnacles to the north and south sides of the nave of York Minster is progressing satisfactorily. Two of the buttresses, with their pinnacles, have been completed on the north side, and the stonework for two more of the six to be placed on this side is now ready for fixing. On the south side, the first has been finished, and the stonework for the second prepared. Mr. Bodley is the architect in charge.

Paul's Cross Memorial.—It was the desire of the late Mr. H. C. Richards, K.C., that Paul's Cross—in the garden of St. Paul's Cathedral—which was demolished in 1643, should be rebuilt, and for this purpose he bequeathed a sum of £5,000. Apparently Mr. Richards anticipated that there might be some difficulty experienced in carrying out his project, and this may have led to his providing the alternative of erecting on the site of the cross a memorial which might be entirely a new design. This latter course is likely to be followed, Mr. Reginald Blomfield, A.R.A., being the architect. The re-erection of the cross, which was a pulpit of wood mounted upon steps of stone and covered with lead, is almost impossible owing to the different line which the present cathedral takes from the old one, and its much greater breadth.

Aberdeen Architectural Association.—This Association—which is distinct from the Aberdeen Society of Architects, affiliated with the R.I.B.A.—held a general meeting last week, when Mr. W. Kelly was elected hon. president, Mr. G. G. Irvine, president, and Mr. J. B. Davidson vice-president. The first annual "At Home" was afterwards held, a number of drawings by well-known architects being exhibited. The president said their main objects were not only to further the progress of architecture, but also to encourage good fellowship with those engaged in the other arts and crafts in the city. He spoke of the rapid progress as a body which the Association had made, and said he thought that, considering their first meeting was only held last November, it was very satisfactory indeed that they should now have a membership of over fifty.

Mr. Edmund Kirby, F.R.I.B.A., is nominated as the new president of the Liverpool Architectural Society.

Change of Address.—Mr. John C. McKellar, I.A., architect and property valuator, has moved from 224, St. Vincent Street to Gresham Chambers, 45, West Nile Street, Glasgow.

Big Claim against a Town Council.—Mr. Mackison, burgh engineer of Dundee for the past thirty-three years, at a salary of £500 a year, claims £36,000 for extra work. By 13 votes to 10 the Town Council have decided to repudiate the claim.

At the new Ivanhoe Hotel, just completed at the corner of Bloomsbury Street and Great Russell Street, London, W.C., the whole of the partitions, amounting to about 8,000 sq. yds., have been constructed by the Arc Fireproof Partitions Co., Ltd., of 26, Olmar Street, S.E.

The new Asylum for the City of York, at Naburn, about three miles from the city, was formally opened on Wednesday last by the Lord Mayor (Alderman Wragge). The total cost of site and buildings has been about £130,000. The asylum has been built from designs by the city engineer, Mr. A. Creer, and provides accommodation for 151 males and 211 females. The contractors were Messrs. George Longden & Sons, Ltd., of Sheffield.

The Directors of Messrs. Marmor, Ltd., importers of Greek marble, entertained a party of architects and friends on Saturday to view the boat-race from their wharf at Crabtree, Fulham. After the race, luncheon was served in a marquee erected on the wharf, and several speeches were delivered. Mr. William David, the managing director, humorously observed that his friends had been brought together under false pretences, as the invitations were issued to view the boat-race, whereas, in reality, he and the directors wanted their friends to see the examples of marbles displayed in different parts of the wharf. After lunch many of the visitors took the opportunity of inspecting these beautiful examples of marble.

The Val de Travers Asphalt Paving Co., Ltd., held its thirty-sixth ordinary general meeting on Wednesday last at River Plate House, Finsbury Circus, E.C. The chairman, Mr. H. C. Scott, said the profits during the past year (£26,798 nett) had been practically the same as for 1904, which was satisfactory. Competition had become very keen, and prices had in consequence been greatly reduced; nevertheless the company was able to maintain its profits by reason of the turnover, which had been more than during any preceding year of the company's business—75 per cent. more than for 1902. A dividend was declared equal to 7½ per cent. per annum. Dealing with the company's Venezuelan property, which had been acquired from the Compagnie Générale Asphalte de France, the chairman said that though work had been suspended by the revolution in the country, efficient machinery had now been erected, and it was anticipated that a shipment of 2,000 barrels per month would be available.

Obituary.

Mr. J. T. Franklin, of Messrs. Franklin & Newman, architects, Rugby, died recently, aged 52.

Mr. William Boulton, for twenty years burgh surveyor of Aberdeen, died last week in his eighty-sixth year.

Mr. Joseph Williams, a well-known West of England builder, was found hanging dead at his residence at Swindon on Friday last.

IN PARLIAMENT.

(By our Press Gallery Representative.)

The Government Buildings Again.

IN the House of Commons last week Sir W. Bull addressed a number of questions to the First Commissioner of Works with regard to Government buildings in Whitehall. He asked if there were any such for which towers were originally designed but which had been abandoned by his predecessors.

Mr. Harcourt replied that towers formed part of the design for the buildings now occupied by the Home Office and the Local Government Board, but they had never been completed.

Sir W. Bull asked if special foundations had been laid in the new Government offices with a view to erecting the towers as designed by the late Mr. Brydon, and what would have been the saving if the special foundations in question had not been completed.

Mr. Harcourt said the reply to the first paragraph of the question was in the negative.

Sir W. Bull followed this by another question as to the estimated cost of the towers and the sums already expended on the materials, and the necessary preparation of stone and scaffolding.

Mr. Harcourt said the cost of building the towers was not separately stated in the estimate, and could not therefore be given without considerable calculation. With regard to the second part of the question, the measuring surveyors had the matter in hand, but some time must elapse before any figures were available.

In reply to a further question, Mr. Harcourt said until the variations had been properly dealt with by the surveyors, and agreement arrived at on the many points requiring adjustment, no reliable estimate of the saving by the decision to abandon the towers could be given.

Sir W. Bull then asked whether it was a fact that 3,000ft. of carved stone would not be required and that 110 masons would be discharged.

Mr. Harcourt: No, sir, I think the hon. member is mistaken in both those figures.

Freights on Cement.

The President of the Board of Trade, Mr. Lloyd-George, has agreed to a suggestion made by Mr. Ernest Lamb that he should make enquiries of the Conference Shipping Lines in this country with regard to the rates quoted by the Continental shipping lines which are in the Conference as to the freights charged on cement to ports in Cape Colony. Mr. Lamb pointed out that on August 1st, 1905, the Conference raised the rates on this side by 2s. 6d. per ton, or about 5½d. per cask, although the Continental shipping lines refused to raise their rates.

Suggested Duty on Imported Slates.

Mr. David MacIver asked the President of the Board of Trade whether, having regard to the magnitude of the slate trade, especially in Carnarvonshire, and to the depression in that trade owing to the importation of slates from abroad free from any contribution to the Imperial revenue or local rates and taxes, he would be prepared to favourably consider a proposal that all such foreign slates should pay an import duty equivalent to the Imperial and local burdens which were incident to those produced in this country.

Mr. Lloyd-George: The slackness in the slate trade appears to be rather attributable to the general depression in the building trade of the United Kingdom than to the imports of slates into this country, which I find were less last year than in any of the past five years. The figures are as follows (in thousands of pounds):—1901, £273; 1902, £286; 1903, £467; 1904, £340; 1905, £262. I am not prepared to recommend the imposition of an import duty on slates.

Irish Building Materials.

Mr. John Roche asked the Chief Secretary for Ireland whether he would give instructions to those responsible for making out the specification for the College of Science to be built in Dublin that the superior quality of the Ballinasloe limestone should be taken into account.

Mr. McKenna, Secretary to the Treasury, who replied, stated that the architects of the Royal College of Science had lately been making a study of Irish building materials, and had come to the conclusion that, subject to prices being satisfactory, large quantities of them could be used in the buildings. It would not, however, be possible at this stage to state what particular stone would be employed.

New Road across the Green Park.

Mr. Harcourt, in answer to Mr. Eugene Wason, stated that the new road across the Green Park into Piccadilly was not constructed to carry wheeled traffic, and there was no intention of opening it for that purpose either now or in the future.

NOTES ON COMPETITIONS.

Proposed new Almshouses at Wareham, Dorset.

This competition is not likely to appeal to anybody practising at any distance from Wareham, for, in addition to there being no architect assessor, the plan of the site is only to be seen at that place. As the value of the proposed buildings is £2,400, a long journey is hardly commensurate with a venture which offers at the best nothing but a very sporting chance. There is one unusual feature in this competition, however, which is good: only sketch plans are required. The trustees propose to select one set of plans from those submitted and to entrust the author of them with the preparation of complete designs and the carrying out of the work at the usual remuneration. A system which requires only sketch plans is one which might frequently be adopted, and one which would work satisfactorily in the hands of a professional assessor. In this instance, unfortunately, the assessors are laymen, so that the advantage is reduced to a doubtful quantity, as it needs a well-trained expert eye to detect the merits of a sketch. Pretty drawing can cover a multitude of faults.

Carnegie Library at Royston, near Oldham.

A limited competition for this library has just been decided in favour of Messrs. Butterworth & Duncan, of Rochdale.

Council School at Farnworth.

Messrs. Ormrod & Pomeroy, of Bolton, are the successful architects in the competition for a council school to be erected in Plodder Lane, Farnworth, at a cost of about £5,500, providing accommodation for 500 scholars.

Competitions Open.

The following is a list of competitions open:—

DATE OF DELIVERY.	COMPETITION.
April 14	SCHOOL AT OSSETT.—Premium of £50 (to merge). Particulars from the Secretary at the Education Office, Ossett.
„ 15	PEACE PALACE AT THE HAGUE.—Particulars from the office of the Carnegie Foundation, Noordeinde 33, The Hague.
May 31	NATIONAL CONGRESS HALL FOR BRAZIL.—Premiums of 15,000, 10,000 and 5,000 milreis (equivalent to about £1,685, £1,125 and £562 respectively). 5,000 milreis also for designs not premiated but desirable to be acquired. The conditions of the competition can be seen at the offices of the Commercial Intelligence Branch of the Board of Trade at 73, Basinghall Street, E.C.
No date	DETACHED AND SEMI-DETACHED HOUSES AT CLIFTONVILLE, BELFAST.—Premium £700. Particulars from R. J. McCounell & Co., 51, Royal Avenue, Belfast.

Enquiries Answered.

The querist's name and address must always be given, not necessarily for publication.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Correspondents are particularly requested to be as brief as possible.

Circular Concrete Reservoir.

RESERVOIR WRITES: "I am designing a circular concrete service reservoir and should be glad of your opinion as to the necessary thickness for the retaining wall against fairly loose soil. The depth of water is to be 8ft and the height of wall from floor to parapet 12ft. For about one-half of the circumference the wall will be surcharged about 6ft., sloping to nothing at the other side. The reservoir is to be open, and the concrete is to be composed of 1 cement, 4 broken stones, 2 sand and gravel; internal diameter 100ft., measured half-way up the water depth if the wall is built on the inside."

As the reservoir has a diameter of 100ft. it is hardly safe to make any allowance for extra strength due to the curvature, and the wall should be calculated as if it were in one straight line. The site of the reservoir has a slope of about 1 in 17, so that at the lower end, as in Fig. 1, the top of the wall will be flush with the surface of the ground, while at the upper end, Fig. 2, the wall will have a surcharge about 6ft. high. Dealing first with Fig. 1, assuming a natural slope of 35 degs. and working in the usual manner for an ordinary retaining wall, the resultant will be found to cut the base at a distance of 0.63ft.

from the edge x. Then by the formula $\frac{2}{3} \frac{W}{d}$ the maximum pressure at x will be $\frac{2 \times 4680}{3 \times 0.63}$

= 4,952 lbs. = say 2.2 tons per sq. ft., which will be within the safe strength of the concrete. Keeping the same thickness of 2ft. at the top of the wall, in Fig. 2, the thickness at the bottom will have to be increased owing to the surcharge. Making use of Rankine's method for surcharged retaining walls, the method of working will be as follows:—Draw the outline of the proposed wall, natural slope of earth, and slope of surcharge in the usual way. From point B set up B P, making an angle with the back of the

wall equal to the natural slope of the earth to be retained, and produce the line of surcharge to fix the position of the point P. Then by Rankine's formula for pressure in lbs. on the back of the wall $\frac{1}{2} W (B P)^2 = \frac{1}{2} \times 112 \times 9.81 = \text{say } 5,380 \text{ lbs.}$ acting horizontally at one-third the height of the wall. Set this out to scale, as C D, and parallel with slope of surcharge draw C E, the length of which is regulated by a vertical line from D; then C E, amounting to 6,550 lbs., will be the actual thrust on the back of the wall. Next find the centre of gravity of the wall, and drop a perpendicular; produce C E to cut this line in F, and from F set out F G equal to the thrust and F H equal to the weight of 1ft. run of wall. Complete the parallelogram, giving F J as the resultant, cutting the base at 1.1ft. from A and having a vertical component W of 8,830 lbs. Then for the pressure on the base $\frac{2}{3} \frac{W}{d} = \frac{2 \times 8,830}{3 \times 1.1} = 5,333 \text{ lbs.} = \text{say } 2.4 \text{ tons per sq. ft.}$ If the slope of the surcharge had been at a smaller angle than the natural slope, a slight alteration in the method of working would be necessary.

HENRY ADAMS.

A Street Alteration.

LLANDUDNO.—ENQUIRER writes: "I have been called upon under the Private Street Works Acts to allow our Council to make an old street in such manner that it can be taken over by them. Objections were raised on the grounds that the work was not needed, and that the scheme was too expensive. Nevertheless the council applied to the district magistrates to have their scheme confirmed, no one appeared to oppose it, and I have now received a bill of costs amounting to £10 12s. 8d., the whole scheme being about £400. I may mention that the magistrates' clerk is an alderman of the Council."

The Council appears to have acted strictly according to the law. You do not state whether formal notice was sent to the Council withdrawing opposition on the part of all the various objectors. In the absence of this the Council was justified in carrying the matter to court. But even if this notice was sent, the Council may have incurred expense in preparing to meet the objections before the notice of withdrawal was received. The question of costs is in the discretion of the court, which has power to direct payment of the whole or part by either party, or payment in such proportions as it thinks fit. It is not well of course that the magistrates' clerk should be a member of one of the contending parties; but the decision is given by the magistrates and not by him.

A HOUSE-BUILDING COMPETITION.

BY way of encouraging the erection on their property at Cliftonville, Belfast, of well-arranged houses, economically yet artistically furnished, the Belfast Garden Estates Co. (Messrs. R. J. McConnell & Co.) have decided to offer prizes to the value of £700, open to all. The competition is divided into three classes, the cost of the residences being limited to £240, £275 and £350 respectively. The competition is not for plans or designs on paper, but for completed houses erected on the estates, and finished throughout and ready for occupation. For the purposes of the competition thirty-three special sites have been laid out on the estate, these sites having frontages towards avenues 40ft. wide. These thoroughfares will be completed by the company, at their expense, in accordance with the requirements of the city surveyor for Belfast. Water, gas and sewers are already laid ready for connection with the new houses, while several acres of land have been enclosed and laid out as a private recreation-ground for the use of the residents.

The Three Classes

into which the competition is divided are as follows:—

Class I.—Detached houses to cost not more than £350 complete and ready for occupation. Each must contain at least two sitting-rooms, four bedrooms, bathroom, two w.c.s, kitchen, scullery, pantry and coal-place. First prize £100, second £50, third £25. In addition, £50 will be awarded to the designer of the house which gains the first prize.

Class II.—Detached houses to cost not more than £275 complete and ready for occupation. Each must contain at least two sitting-rooms, three bedrooms, bathroom, w.c., kitchen, scullery, pantry and coal-place (or open gin. brick-built coal-bunker). It is suggested that in these smaller houses, and also in the semi-detached houses, Class III., the living-room should be decidedly larger than the best room or parlour. The prizes offered are similar to those in Class I.

Class III.—Pair of semi-detached houses erected complete and ready for occupation at a cost of not more than £480 the pair. Each house must contain at least two sitting-rooms, three bedrooms, bathroom and w.c., kitchen, scullery, pantry and coal-place (or open gin. brick-built coal-bunker). The prizes are similar to those in the other classes.

Full particulars of the conditions of the competition can be obtained from the estate office, Cliftonville Circus, Belfast. All applications on official forms (which will be supplied for the purpose) must be sent to Messrs. Carson & McDowell, solicitors, 51, Royal Avenue, Belfast, on or before May 15th, together with £5 5s., which will entitle the owner, his nominee or purchaser (who may not necessarily take out a lease for eighteen months from date of application) to a lease in perpetuity of the lot allocated, at the yearly rent stated on the schedule attached to the conditions. All houses must be completed on or before November 1st next. Mr. Maurice B. Adams, F.R.I.B.A., of London, has been appointed by the company to act as professional assessor and to award the several prizes.

Prizes for Furnishing.

To encourage the economic furnishing of the houses, the company offer to the occupier or the furnisher a silver cup (or other article to be chosen by the winner), value £10 10s., for the house in Class I. furnished best at a cost not exceeding £175, and a cup or prize value £5 5s. as second prize; similar prizes being offered for the best furnished house in Class II., the cost not to exceed £125. The entrance fee for these furnishing competitions is £1 1s., which must be paid on or before July 1st next.

CIRCULAR CONCRETE RESERVOIR.

Complete List of Contracts Open.

WITH a few exceptions, news of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issue of other contracts that still remain open.

Unless expressly stated to the contrary all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair-wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

April 12. Penrith.—*Additions to two houses in Wordsworth Street, for Stephen Slinger.* Plans, specifications, &c., may be seen on application to G. Watson & Son, architects, St. Andrew's Chambers, Penrith, to whom tenders are to be sent not later than April 12.

April 12. Killarney.—*Building and completing a rectory for the parish of Killarney, in accordance with plans and specifications, which may be seen at the offices of the Architects or at the residence of Rev. J. D. Madden, Woodlawn, Killarney.* Sealed tenders, marked "Tender for Rectory," to be lodged with W. H. Hill & Son, architects, 28, South Mall, Cork, on or before April 12.

April 12. Bradford.—*Various works (ironfounders and engineers excepted) required in the extension of a warehouse.* Plans and specifications and conditions of contract may be seen, and bills of quantities obtained at the offices of Milnes & France, architects, 99, Swan Arcade, Bradford, to whom tenders must be sent not later than 9 a.m. on April 12.

April 12. Lichfield.—*Pulling down of old cottages and erecting two dwelling-houses and domestic offices in Stowe Street, for the Trustees of Milley's Hospital.* Plans, &c., may be seen at the office of W. Perry, 39-41, Bore Street, Lichfield. Tenders, endorsed "Stowe Street," must be sent to H. H. Brown, steward, Bird Street, Lichfield, not later than noon on April 12.

April 12. Spreyton.—*Pair of cottages for George Lambert.* Plans and specifications may be seen at the office of Harbottle Reed, architect, 12, Castle Street, Exeter, to whom tenders must be sent by April 12.

April 12. Newquay.—*Alterations and improvements at the council schools for the Cornwall Education Committee, according to the specification which may be seen at the schools, or at the office of the architect, B. C. Andrew, Biddick's Court, St. Austell.* Forms, upon which all tenders must be made, may be had from the architect or the secretary. Sealed endorsed tenders to be sent to F. R. Pascoe, secretary, Education Office, Truro, by April 12.

April 12. Hazlemere.—*New Free Methodist Chapel.* Plans and specifications can be seen at H. Tilling's, Wycombe Marsh, to whom all tenders must be sent, marked "Tender," not later than April 12.

April 12. Kendal.—*Proposed alterations and additions to Broom Close, Kendal.* Plans may be seen and quantities and specifications obtained at the office of John F. Curwen, F.S.A., F.R.I.B.A., architect and sanitary engineer, 26, Highgate, Kendal, to whom tenders must be sent not later than noon on April 12.

April 12. Antrim.—*Labourers' cottages in the rural district, for the Rural D. Council, in accordance with plans and specifications which can be seen at the office of the clerk of the Council, or at the office of the architect, W. T. R. Taggart, Scottish Provident Buildings, Belfast, as follows:*—Two cottages at Townparks, Antrim, on the lands of Dr. Gawn; two cottages at Townparks, Antrim, on the lands of Mrs. Young; one cottage at Islandbawn, Muckamore, cr. the lands of John Clark; one cottage at Ballyear, Carrmoney, on the lands of William Houston; one cottage at Ballyrobin, Muckamore, on the lands of Scott Gilliland; one cottage at Killyfad, Randalstown, on the lands of John Fulton; one cottage at Annaghmore, Toomebridge, on the lands of B. O'Boyle; one cottage at Portlee, Toomebridge, on the lands of Mrs. McCann; two cottages at Ballynamullen, Toomebridge, on the lands of Felix Lavery; one cottage at Tannaderry, Randalstown, on the lands of James Gilbert; four cottages at Cranfield, Randalstown, on the lands of James Charleton; two cottages at Cranfield, Randalstown, on the lands of Bernard O'Kane; one cottage at Cranfield, Randalstown, on the lands of Mrs. Hume; two cottages at Ballydonagh, Crumlin, on the lands of John McCurg; two cottages at Ballyshanagill, Crumlin, on the lands of John Nelson; two cottages at Feehogue, Randalstown, on the lands of Lord O'Neill; four cottages at Lurgan West, Randalstown, on the lands of Lord O'Neill; one cottage at Ballygrooby, Randalstown, on the lands of G. L. Young; two cottages at Craigmore, Randalstown, on the lands of J. H. Mulligan; two cottages at Ballymacilhoyle, Crumlin, on the lands of W. S. Thompson. Persons tendering may do so for any or all of the different blocks, but they must name the particular site or sites on their tender. Tenders are to be lodged with J. Clark, clerk of Council, Union Office, Antrim, by 10 a.m. April 12.

April 12. Farnborough.—*Alterations and additions to the "Swan Inn," for Crowley & Co., Ltd.* Plans and specification may be seen and further particulars obtained upon application to Friend & Lloyd, architects, Aldershot, to whom the tenders are to be sent not later than 11 a.m. on April 12, endorsed "Tender for Alterations, 'Swan Inn.'"

April 12. Grange-over-Sands.—*New stores, for the Carnforth Co-operative Society, Ltd.* Contractors must make application for quantities to H. E. Illingworth, architect, 8, East Parade, Leeds, before April 12.

April 13. Kirkby-in-Furness.—*New bank premises, for the Lancaster Banking Co. Plan, &c., may be seen on application to J. Waye, care of Settle & Brundrit, Ulverston.* Sealed tenders, endorsed "Bank," to be sent to J. Waye, by noon on April 13.

April 14. Bramley.—*Slaters', plumbers', plasterers' and painters' work in the erection of eight houses at Bramley.* Plans and specifications may be seen at the

offices of Beckwith & Webster, architects, 2, Basinghall Square, Leeds, to whom sealed tenders are to be sent in by April 14.

April 14. Leith.—*Repair and maintenance, for five years from Whitsun, of the whole of the roofs and roof-lights of the sheds, warehouses, offices and other buildings at the harbour and docks, for the Harbour Commissioners.* Particulars may be obtained on application at the office of the superintendent, Peter Whyte, M.I.C.E., Tower Place, Leith. Tenders to be lodged with Victor A. Noel Paton, W.S., clerk to the Commission, 31, Melville Street, Edinburgh, on or before April 14.

April 14. Newhaven.—*Erection of small sheds for stores at Newhaven Harbour for Leith Harbour and Dock Commissioners.* Drawings may be seen and schedules of measurements may be obtained on application at the office of the superintendent, Peter Whyte, M.I.C.E., Tower Place, Leith. Tenders to be lodged with Victor A. Noel Paton, W.S., clerk to the Commission, 31, Melville Street, Edinburgh, on or before April 14.

April 14. Queenstown.—*Erection of six houses, for the Queenstown Naval Dwellings Co., in accordance with plans and specification prepared by W. H. Hill & Son, architects, 28, South Mall, Cork, with whom tenders are to be lodged on or before April 14.* Detailed quantities may be obtained from the Architects on payment of £1 rs.

April 14. Pontypridd.—*Erection of two cottages at Coodpenmaen, Pontypridd, for the Wesleyan Trallwn Mission.* Plans and specification can be seen at the offices of A. O. Evans, Williams & Evans, architects, Pontypridd, to whom sealed and endorsed tenders must be sent by April 14.

April 14. Wakefield.—*New school at Normanton Woodhouse and alterations to Normanton Woodhouse Provided School:—Builder, joiner, slater, plasterer, ironfounder and smith, plumber, painter.* A deposit of £1 is required. Cheques, &c., to be sent to the West Riding treasurer. Those desirous of tendering should send in their names to J. Vickers-Edwards, county architect, County Hall, Wakefield, by April 14.

April 14. Aberayron.—*Alterations and repairs to the school for the Cardigan County Education Committee.* Plan and specification can be seen at the school in charge of the Headmaster. Tenders sealed and endorsed "Aberayron School Repairs" are to be delivered at the office of B. C. Jones, clerk to the District Education Committee, Aberayron, not later than midday on April 14.

April 14. Wakefield.—*New school at Sandal, near Wakefield, Stainforth (Thorne Union) Provided School: new cloak-room, &c., &c.; Castleford Wheldon Lane Provided School: alterations, repairs, &c.* A deposit of £1 is required for each of the above schools, which will be returned on receipt of a *bona-fide* tender. Cheques, &c., to be sent to the West Riding Treasurer. Builders desirous of tendering must send in their names to J. Vickers-Edwards, county architect, County Hall, Wakefield, by April 14.

April 14. Aberarth.—*Alterations and repairs to the school for the Cardigan County Education Committee.* Plan and specification can be seen at the school in charge of the Head Master. Tenders sealed and endorsed "Aberarth School Repairs" are to be delivered at the office of B. C. Jones, clerk to the District Education Committee, Aberayron, not later than mid-day on April 14.

April 16. Glasgow.—*Excavation, embanking and construction of drains, roads, &c., required in the formation of timber storage ground behind Merklands Quay, Partick, for the Trustees of the Clyde Navigation.* Drawings may be seen, and specification, schedule of quantities, and form of tender can be obtained on application to the trustees' engineer, W. M. Alston. Sealed tenders, marked "Tender for Timber Depot at Merklands," to be lodged with T. R. Mackenzie, general manager and secy., 16, Robertson Street, Glasgow, not later than 10 a.m. on April 16.

April 16. Hastings.—*Construction and erection of four covered seats upon the Esplanade at Breeds Place, Eversfield Parade and Grand Parade.* Drawings and specification may be seen and form of tender obtained at the office of the borough engineer, P. H. Palmer, M.I.C.E., Town Hall, Hastings, between 10 and 5. Sealed tenders, endorsed "Tender for Covered Seats," must be delivered at the Town Clerk's Office, Town Hall, Hastings, not later than noon on April 16.

April 17. Cockton Hill.—*New council school, for the Durham County Education Authority.* Plans, specifications, and general conditions of contract can be seen, and bills of quantities obtained at the office of the architect, G. G. Hoskins, Darlington. Sealed tenders, endorsed "Cockton Hill Council School Tender," are to be sent addressed to the Secretary, Elementary Education Department, Shire Hall, Durham, by April 17.

April 17. Ulverston.—*Erection of five houses in Clarence Street, for the Swarthmoor and Ulverston Co-operative Society, Ltd.* Persons desiring to submit tenders may inspect drawings and specifications and obtain bills of quantities and other particulars at the office of the architects, Settle & Brundrit, A.A.R.I.B.A. Each tender must be enclosed in a sealed envelope, endorsed "Tenders for Five Houses, Clarence Street, Ulverston," and delivered to the Architects' Office not later than noon on April 17. Fair wages clause.

April 17. Herne Bay.—*Enlargement of the County Police Station at Herne Bay, ordered by the Standing Joint Committee.* Plans and specification can be seen and

bill of quantities and tender form obtained on deposit of £2 at the office of the County Architect, 35, Week Street, Maidstone, between 10 a.m. and 5 p.m. Sealed tenders, endorsed "Herne Bay Police Station," are to be delivered to Charles Turner, clerk, at the Sessions House, Maidstone, not later than 5 p.m. on April 17.

April 17. Mousehole.—*Erection of a villa for R. I. Harvey, Liverpool.* Plans and specifications may be seen at the office of the architect, Henry Madlern, F.I.A.S., 13, Clarence Street, Penzance, to whom sealed tenders are to be sent by April 17.

April 17. Tredegar.—*Erection of twenty-two houses at Charles Street.* Applications to see plans and specification must be made, with deposit of £1 rs., to Thomas Danks, Oakfield Road, Tredegar, architect and surveyor, between the hours of 12 and 2; also 5 and 7. Sealed tenders, endorsed "Tender for Houses, Charles Street," must be received by J. Porteous Bell, secy., Hawthorn Villa, Tredegar, by April 17.

April 17. Neuaddwyd.—*Restoration of chapel in accordance with the plans and specification which are to be seen at Neuaddwyd Chapel House.* Tenders, endorsed "Chapel," are to be sent in on or before April 17, to the Rev. T. Gwilym Evans, Aberayron, Cardiganshire.

April 13. London, N.E.—*Repairing and rendering watertight, by an asphalt lining, the swimming bath at the schools at Brentwood, for the Guardians of the Hackney Union.* Specification, conditions of contract and tender form (prepared by W. A. Finch, architect, 76, Finsbury Pavement, E.C.) can be obtained of F. R. Coles, clerk, between 10 a.m. and 4 p.m. Sealed tenders, endorsed "Repairing Swimming Bath, Brentwood Schools," must be delivered to Frank R. Coles, clerk to the Guardians, Clerk's Office, Sidney Road, Homerton, N.E., by 2 p.m. on April 18.

April 18. Treorky.—*Extension of Horeb English Baptist Chapel, Treorky, Rhondda Valley, for the Trustees.* Plans and specification may be seen at the office of W. D. Morgan, architect, Victoria Chambers, Pentre. Sealed and endorsed tenders to be delivered to William Lawrence, The Institute, Treorky, on or before noon on April 18.

April 18. Newhaven.—*Erection of new Council offices and fire-station in Fort Road.* The specification, conditions of contract and drawings of the proposed buildings may be seen at the office of F. J. Rayner, architect, 34, Meeching Road, Newhaven, any day between the hours of 1 and 2 o'clock, from whom copies of the bill of quantities and forms of tender may be obtained on deposit of a postal order value £1 rs. Fair wages clause. Tenders under seal, and marked "Council Offices," to be delivered to Edward Knightley, clerk to the Council, Council's Offices, Newhaven, not later than 4 p.m. on April 18.

April 18. Sandy.—*New Council school, for the Bedfordshire County Council.* The drawings, specifications, and form of contract may be inspected at the offices of Gutch & Saunders, architects, Bank Chambers, Kettering, between 11 and 4, on any working day except Saturday. Builders desirous of tendering must send their names and addresses to the above-named architects on or before April 7, together with a deposit of £1 rs., when a copy of the bill of quantities and form of tender will be forwarded to them. Sealed tenders, endorsed "Tender for Sandy Council School," must be sent to W. W. Marks, clerk of the Council, Shire Hall, Bedford, before 5 p.m. on April 18.

April 18. Hunslet.—*Erection of an engineer's house, at the new workshop, Rothwell Haigh, in accordance with the drawings and specifications prepared by the architect, J. H. Morton, F.R.I.B.A., 50, King Street, South Shields.* Applications for bills of quantities and forms of tender must be made to the architect on or before April 7, accompanied by a deposit of £1. Bill of quantities will be supplied to such applicants only. Drawings may be inspected at the offices of the clerk or the architect, and tenders on the forms provided must be delivered at the Union Offices, Hunslet, Leeds, by 10 a.m. on April 18.

April 18. Aberaman.—*New public hall, institute and free library at Aberaman, Aberdare.* Plans and specification can be seen at the architect's office, Clifton Street, Aberdare, where bills of quantities can be obtained. Sealed and endorsed tenders to be sent in to W. W. Price, Bryn Cottage, Hill Street, Aberaman, not later than April 18.

April 19. Marlow.—*Alterations and additions to the music-room, for the Marlow Public Hall, Ltd.* Plans and specification may be seen at the office of R. Wellcome, 5, High Street, Marlow. Tenders (endorsed) to be delivered at the office of the Company, 5, High Street, Marlow, not later than 5 p.m. on April 19.

April 19. Blaydon.—*Enlargement of the Galvanized Iron Isolation Hospital at Normans Riding, comprising the erection of administrative, laundry and discharging blocks and two pavilions, for the Blaydon, Ryton and Whickham Joint Hospital Committee.* Plans and specifications may be seen and form of tender obtained on application to J. B. Renton, Council Offices, Whickham, R.S.O. (who will attend at the Council Offices, Whickham, by appointment, to supply all particulars) upon payment of £1. Sealed tenders, endorsed "Tender for Hospital," must be delivered to Henry Dalton, clerk, Blaydon-on-Tyne, by noon on April 19.

April 20. Cross Keys.—Twenty-five (more or less) houses near Nine Mile Point Collieries, Sirhowy Valley. Plans and specifications may be seen with T. Thomas, Nine Mile Point Collieries, near Cross Keys, Mon., or at the office of R. L. Roberts, M.S.A., Abercarn. Sealed tenders, endorsed "Tenders for Houses," by April 20.

April 20. Drogheda.—Erection of an hospital, for the Drogheda Cottage Hospital Committee. Drawings and specifications may be inspected with the Hon. Secretaries, Greenhills, Drogheda, and copies obtained from Frederick Shaw, M.R.I.A.I., architect, St. Laurence Street, Drogheda. Sealed tenders to be sent to Sidney Smith, Rosa Smith, hon. secs., Greenhills, Drogheda, not later than April 20.

April 20. Cothal.—Mason, carpenter, slater, and plasterer works of new dwelling-house and shop to be erected at Cothal; also for the mason and carpenter works of repairs and concrete floor at the old mill, Cothal. Plans and specifications may be seen in the hands of Alexander Stronach, junr., & Son, advocates, 29, Belmont Street, Aberdeen. Contractors will meet at Cothal on April 14 current, at 2 p.m., when the works will be pointed out by Mr. Stewart, architect, and offers must be lodged with A. Stronach, junr., & Son on or before April 20.

April 20. Wells-next-Sea.—Enlargement of school for the Norfolk Education Committee. Builders desirous of tendering can inspect plans and specification and obtain copies of quantities at the office of A. F. Scott, architect, Castle Meadow, Norwich, on and after April 5. A deposit of £1 rs. will be required. Tenders must be delivered by noon on April 20, addressed to "The Secretary, Norfolk Education Committee, 57, London Street, Norwich," and endorsed "Tender for Wells-next-Sea School."

April 20. Tonbridge.—New Council school, to accommodate 420 children, at Tonbridge, Kent. The drawings and specification may be inspected at the office of the architect, C. H. Strange, A.R.I.B.A., 20, Dudley Road, Tunbridge Wells. Any person desiring to tender must send in his name to the architect, accompanied with a deposit of £1, not later than noon on April 5. The tenders, on the form supplied, to be delivered to N. R. Stone, 23, Church Road, Tunbridge Wells, not later than noon on April 20.

April 20. Hawkinge.—Enlargement to the Council school, at Hawkinge, near Folkestone, Kent. Drawings and specification may be inspected at the office of the architect, Andrew Bromley, Radnor Chambers, Folkestone. Any person desiring to tender, must send in his name to the architect, accompanied by a deposit of £1, not later than noon on April 5. Tenders, on the form supplied, to be delivered to W. Thomas, 66, Broadmead Road, Folkestone, not later than noon on April 20.

April 21. Manchester.—Supply of terra-cotta for the Queen Street Municipal School. Plans may be seen and a copy of the bill of quantities (including specification) may be obtained at the Education Offices in Deansgate, Manchester, on a deposit of £1 rs. Tenders, on the forms and in the envelopes provided, must be delivered at the Deansgate offices of the Education Committee not later than April 21.

April 21. Mold.—Alterations and extensions to the County School, Mold, Flintshire, North Wales. Plans and specifications may be seen at the offices of the architect, Samuel Evans, N. & S.W. Bank Buildings, High Street, Mold, from whom bills of quantities may be obtained on payment of a sum of £2 rs. Tenders to be made out on forms to be supplied, and sent in to W. R. Howard Evans, solicitor, Mold, clerk to the Governors, by April 21.

April 21. Swindon.—Alterations and additions to Sanford Street Council School, according to plans prepared by R. J. Beswick, 10, Victoria Road, Swindon, where the plans, general conditions and specification may be inspected. A copy of the bill of quantities and form of tender can be obtained from the Architect on payment of £1 rs. Fair wages clause. Sealed tenders, on the prescribed form, endorsed "Alterations, Sanford Street Council School," and accompanied by priced (detail) bill of quantities under separate cover, to be delivered to Robert Hilton, town clerk, Town Hall, Swindon, by April 21.

April 23. Coventry.—Nurses' home, for the Coventry and Warwickshire Hospital Committee, in accordance with plans and specifications prepared by the architects, A. Hessel Tiltman, F.R.I.B.A., 1, Raymond Buildings, Gray's Inn, London, W.C., and Herbert W. Chataway, Trinity Churchyard, Coventry. Plans and specifications may be seen at the Architect's Office, Trinity Churchyard, Coventry, and bills of quantities and forms of tender can be obtained upon depositing the sum of £3 3s. Tenders, sealed and endorsed "Nurses' Home," to be sent to Ellis E. Crisp, secty., Coventry and Warwickshire Hospital, Stoney Stanton Road, Coventry, not later than 10 a.m. on April 23.

April 23. Eastbourne.—Additions to the Motor Omnibus House at Roselands. Plans and general conditions may be seen, and specification, bill of quantities, and form of tender obtained at the Borough Surveyor's Office, Town Hall, on payment of a deposit of £1 rs. Tenders endorsed "Motor Omnibus House" to be sent to A. Ernest Prescott, borough surveyor, Town Hall, Eastbourne, not later than noon on April 23.

April 23. Truro.—Detached residence at Short Lanes End, Truro, for Thomas Powell, according to plans and specification which may be seen at the office of A. J. Cornelius, architect, Truro. Sealed tenders, endorsed, to be sent to Thomas Powell, Treyew Road, Truro, on or before April 23.

April 23. Truro.—Alterations and additions to "Trevaunance," Truro (now known as Combridgey House), for E. L. Carlyon, according to plans and specification, which may be seen at the office of A. J. Cornelius, architect, Truro. Sealed endorsed tenders to be sent to E. L. Carlyon, Truro, on or before April 23.

April 24. Ilford.—Erection of a junior mixed and infants' school for 630 children, together with latrines, playsheds, fencing, &c., on the Water Lane site, Ilford, Essex. Plans and specifications can be seen, and bills

of quantities and forms of tender can be obtained at the office of the architect, Charles J. Dawson, 11, Cranbrook Road, Ilford, between the hours of 10 a.m. and 5 p.m., upon depositing £5 ss. Fair wages clause. Sealed tenders, endorsed "Tender for Water Lane School," are to be addressed and delivered to John W. Benton, Clerk to the Council, Town Hall, Ilford, Essex, by noon on April 24.

April 24. Boston.—New post office at Boston. Drawings, specifications and a copy of the conditions and form of contract may be seen on application to the Postmaster between 11 and 4. Bills of quantities and forms of tender may be obtained at H.M. Office of Works, Storey's Gate, S.W., on payment of £1 rs. Tenders must be delivered before noon on April 24, addressed to the Secretary, H.M. Office of Works, &c., Storey's Gate, London, S.W., and endorsed "Tender for Boston Post Office."

April 25. Brimington.—Alterations and additions to the Central Schools, Brimington, near Chesterfield. Plans, &c., can be seen and bills of quantities and all information obtained at the offices of W. C. Jackson, M.S.A., architect and surveyor, 29, Knifesmith Gate, Chesterfield, upon payment of £1 rs. Sealed tenders, endorsed "Brimington Schools," to be sent to C. J. Kerslake, clerk, Education Offices, Foljambe Road, Chesterfield, not later than April 25.

April 27. Chelmsford.—Widening a small brick bridge in the parish of Waltham Holy Cross, known as Broomstick Hall Bridge, for the County Council. Plans and specifications may be seen at the Surveyor's Offices at Chelmsford on any day. Tenders must be delivered to the County Offices, Chelmsford, not later than April 27.

April 27. Chelmsford.—Brick and concrete abutments, &c., for a small bridge at Radwinter, near Saffron Walden, for the County Council. Plans and specifications may be seen at the Surveyor's Offices at Chelmsford. Tenders must be delivered to the County Offices, Chelmsford, not later than April 27.

April 27. Waterloo.—Erection of public library and museum buildings adjoining the Town Hall, Waterloo, near Liverpool, for the U.D.C. Bills of quantities may be obtained from the clerk, upon payment of a deposit of £2 rs. Drawings and specifications may be seen at the office of O. D. Black & A. F. Milligan, architects, Central Chambers, South Castle Street, Liverpool. Sealed tenders, endorsed "Tender for Public Library and Museum," must be delivered to John I. Thompson, clerk to the Council, Town Hall, Waterloo, near Liverpool, not later than noon on April 27.

April 30. Tywardreath.—Renovation and alteration of the Wesleyan Church, Tywardreath, Par Station. Plans and specifications may be seen at the residence of Caleb Thomas, Tywardreath, Par Station, to whom tenders, sealed and endorsed "Church Tenders," must be sent on or before April 30. All further particulars may be obtained at the office of the architect, F. C. Jury, No. 1, Alma Villas, Tregonisey Road, St. Austell.

No date. Harsisehead.—Erection of a house at Harsisehead, for the Harsisehead Colliery Co., Ltd. For particulars apply to Fred C. Crimes, architect and surveyor, Liverpool Road, Kidsgrove.

No date. Apperley Bridge.—Additional wings and other work at Woodhouse Grove Schools. Persons desirous of tendering will please send their names to W. J. Morley, F.R.I.B.A., & Son, architects, 269, Swan Arcade, Bradford.

No date. Aldershot.—Erection of a villa in St. Michael's Road. Plan and specification may be seen or any further information obtained upon application to Friend & Lloyd, architects, Aldershot.

No date. Horsforth.—Extension to Springfield Convalescent Home. Contractors desiring to tender are requested to send in their names to Walter A. Hobson & Co., architects, 2, Basinghall Square, Leeds. A deposit of 10s. will be required for each set of quantities.

No date. Shaftesbury.—Erection of a new Wesleyan church. Plans and specifications may be seen and quantities obtained by application to the Rev. H. Hopkinson, Shaftesbury.

No date. Cardiff.—Erection of new warehouse premises, Tredegar Street. Plans and specifications may be seen and quantities obtained at the Tredegar Estate Office, Pearl Street, Roath, or at the office of Alfred Lewis, estate agent, 5, St. John's Square, on payment of £1 rs.

No date. Christow.—Erection of a cottage and other buildings. Builders wishing to tender should send their names to J. Archibald Lucas, F.S.I., A.R.I.B.A., architect and surveyor, Guildhall Chambers, Exeter.

ENGINEERING.

April 14. Christiania.—Bridge work. The Norwegian State Railway Department require tenders for bridge-building work, the total weight of ironwork in connection with the two bridges concerned amounting to about 328 tons. Copies of the general regulations, conditions and form of tender may be seen at the offices of the Commercial Intelligence Branch of the Board of Trade, 73, Basinghall Street, London, E.C. A set of twenty-two drawings may be obtained at a cost of 11 kroner (about 12s. 3d.) per set, from the Chief Cashier of the Norwegian State Railways, No. 1, Jernbanetorget, Christiania. Tenders in sealed envelopes will be received in Christiania up to 10 a.m. on April 14.

April 17. Auldhous.—Removing the present bridge and erecting a new stone and concrete bridge on 11th Liebank Road, over the Auldhous Burn, and diverting the roadway there, for the First and Upper District Committee of the county of Renfrew. The drawings may be seen at the office of George B. Walker, measurer, 65, Bath Street, Glasgow, from whom copies of the specification, schedule of quantities and form of tender may be obtained on payment of £1 rs. Sealed tenders, marked outside "Tender for Auldhous Bridge," must be lodged with William H. Hill, district clerk, 194, Ingram Street, Glasgow, not later than 10 a.m. on April 17.

April 18. Wells.—Building a service reservoir to contain 100,000 gallons, for the Somerset and Bath Asylum. The reservoir is to be constructed of concrete and masonry, with brick lining and roof of reinforced concrete in accordance with plans prepared by William Phelps, C.E., of Crocombe, Wells. Plans and specification to be seen at the Asylum Clerk's Office. Tenders must be delivered at the Asylum not later than 10 a.m. on April 18.

April 23. Bamford.—Construction of the Bamford filters and the Derwent to Grindleford section of the Derwent aqueduct, in the county of Derby, for the Derwent Valley Water Board. The work will comprise:—Roughing filters, 3,500 sq. yds.; sand filters, 21,000 sq. yds.; cut and cover, $\frac{3}{4}$ mile; 45in. pipelaying, $7\frac{1}{2}$ miles; with valve-houses, stream crossings, &c. The specification and schedule of prices and copies of the drawings may be obtained on application to Edward Sandeman, M.I.C.E., engineer to the Board, on payment of £5 ss. Sealed tenders, enclosed in the printed envelope supplied with the documents, to be delivered to O. B. Steward, clerk to the Board, Bamford, near Sheffield, not later than 9 a.m. on April 23.

April 24. London, S.W.—Reconstruction of Victory Bridge over the Regent's Canal, in the borough of Stepney and the administrative county of London, for the County Council. Persons desiring to submit tenders may obtain the drawings, specification, bills of quantities, form of tender and other particulars, upon application to the chief engineer, Maurice Fitzmaurice, C.M.G., at the County Hall, Spring Gardens, S.W., upon payment to the cashier of the Council of the sum of £3. Tenders must be upon the official forms, and the printed instructions contained therein, must be strictly complied with. Fair wages clause. Each tender is to be delivered at the County Hall, in a sealed cover, addressed to the Clerk of the London County Council, Spring Gardens, S.W., and marked "Tender for the Reconstruction of Victory Bridge." No tender will be received after 10 a.m. on April 24.

April 25. London, E.C.—Deck spans (from 6ft. to 33ft. in the clear), as per specification, for the East Indian Railway Co. Specification, for which £1 rs. (not returnable) will be charged, can be obtained at the Company's Offices. Tenders to be marked "Tender for Deck Spans," and sent in to C. W. Young, secretary, Nicholas Lane, London, E.C., by noon on April 25.

April 25. Brussels.—Railway plant. For the construction of the Erezée to Hottot section of the local railway from Comblain la Tour to Manhay and Melreux. Estimated cost 168,000 fr. (6,720). A deposit of 16,000 fr. (£40) will be required. A copy of the specification may be obtained, price 1 fr., from M. l'Hoir, rue Edouard-Wacken, 10, Liège. Tenders in sealed envelopes should be addressed to the General Manager, Société Nationale des Chemins de Fer Vicinaux, 14, rue de la Science, Brussels, by April 25.

April 27. Sofia.—Bridgework. For the construction of a bridge over the Wladajafuss, at an estimated cost of 50,000 frs. (£2,030), for the Town Council, Sofia, by whom tenders will be received up to April 27.

April 30. Darlington.—Supply, delivery and erection of a counter current jet condensing plant complete with piping and cooling tower. Plans, specification and form of tender may be obtained from the Borough Electrical Engineer, Electricity Works, Houghton Road, Darlington, on payment of a deposit of £1 rs. Sealed tenders, endorsed "Condensing Plant," to be delivered at the office of H. G. Steavenson, town clerk, Houndgate, Darlington, on or before April 30.

May 2. London, E.C.—Extension of Parkston Quay and construction of a shed and sidings in connection therewith for the Great Eastern Railway Co. Persons desirous of tendering can, on application to the Engineer, obtain copies of the specifications and quantities, and the drawings can be inspected at his office at Liverpool Street on and after April 17 between 10 and 4. Sealed tenders, endorsed "Tender for Extension of Parkston Quay," Contract No. 1, should be addressed to W. H. Pepper, corne, and must be delivered at the Secretary's Office, Liverpool Street Station, not later than 10 a.m. on May 2. Tenders to be sent through the "General Post Office." Any sent otherwise will not be considered. The sum of £10 rs. will be charged to each applicant for the specification and quantities, schedules and form of tender.

May 8. Deptford.—Construction of a footbridge for the Borough Council, according to the drawings and specification which may be seen at the Borough Surveyor's Office at the Town Hall after April 23, during the ordinary office hours. It will be a condition of the contract that the steelwork must not be sublet. Fair wages clause. Bills of quantities prepared by W. T. Farthing & Son, together with the conditions of contract, may be obtained from the Town Clerk, Town Hall, Deptford, upon payment of a deposit of £1 rs. Persons desirous of tendering must send their names to the Town Clerk on or before April 17, to whom sealed tenders, in accordance with the Council's regulations printed on the form of tender, must be sent not later than 4 p.m. on May 8.

May 12. King's Lynn.—Waterworks extension. Contract No. 1: Supplying and fixing slow-speed steam engine (surface condensing, differential, or criss-compound horizontal), pumps, condensers and the necessary alterations to existing steam pipes, delivery mains, &c. Contract No. 2: Sinking and lining an 8ft. diameter well. Contract No. 3: Supplying and fixing one 24ft. by 6ft. 6in. Lancashire boiler, and a 48-tube economizer, with all the necessary seatings, chambers and alterations to existing flues. Contract No. 4: Supplying and fixing a cast-iron tank 13ft. by 9ft. by 4ft. 6ins. Contract No. 5: Extensions to engine-house and mechanics' shop. General conditions, stipulations, specifications, bills of quantities and forms of tender may be obtained from and drawings inspected on application to J. H. Webb, waterworks engineer, Town Hall, King's Lynn, on and after April 17, upon receipt of a deposit of £3 3s. for contract No. 1 and £1 rs. each for contracts Nos. 2, 3, 4 and 5. Sealed tenders, endorsed "Tender for Waterworks," to be delivered to J. W. Woolstencroft, town clerk, Town Hall, King's Lynn, by May 12.

(Continued on p. xxii.)

THE TIMBER TRADE.

London Market in March.

ALL wood markets kept still during March. The large business effected in February for shipment sufficed for the forward requirements of European importers, estimated on a low scale, and the latter are content to await events in regard to further purchases for the present. On the other hand shippers cleared their stock notes sufficiently to save them from all necessity for forcing further sales. Messrs. Churchill & Sim state that the probability seems still in favour of an easy maintenance of present quotations during the remainder of the season, and should the prevailing improvement in general trade overtake the wood trade in time it would have a further favourable effect very quickly. So far, however, there has been no sign of this, and the complaint of lack of demand continues very general from all markets. In London 1,000 standards less have been delivered from the docks than was the case in March, 1905, bringing the deficiency for the first quarter of the year up to 4,000 standards. Against this, 600 standards more in March and 2,200 standards more in the quarter have been passed over side.

The abstract of dock stock, consumption, &c., for March, published by Messrs. Foy, Morgan & Co., is given in the table at the foot of this page.

Dock Stock.

The stock of wood in the public docks on March 31st was:—

	Pieces.
Foreign deals and ends - - -	954,000
Do. battens - - -	1,630,000
Pine deals and battens - - -	683,000
Spruce do. do. - - -	594,000
Boards, rough - - -	2,988,000
Do. prepared - - -	5,568,000

totalling 12,417,000 pieces, as against 15,361,000 in 1905, 17,706,000 in 1904, and 14,636,000 in 1903.

In other kinds the stock was as follows:—

	Pieces.
Foreign wainscot logs - - -	148 pieces.
Do. oak timber - - -	358 loads.
Do. fir timber - - -	1,614 do.
Do. Oregon pine, &c., spars and masts - - -	5,325 do.
Colonial oak timber - - -	1,113 do.
Do. birch timber and planks - - -	3,143 do.
Do. elm and ash timber - - -	643 do.
Do. yellow pine - - -	262 do.
Do. red pine - - -	64 do.
United States pitch-pine timber - - -	11,011 do.
Do. do. deals - - -	19,000 pieces.
East India teak - - -	6,803 loads.

Deliveries.

The deliveries have been—

	First Quarter.	March.
	Pieces.	Pieces.
Foreign deals and ends - - -	854,000	286,000
Do. battens - - -	1,497,000	551,000
Pine deals and battens - - -	266,000	106,000
Spruce do. do. - - -	311,000	137,000
Boards, rough - - -	1,447,000	550,000
Do. prepared - - -	3,475,000	1,299,000

totalling 7,760,000 pieces for the first quarter, and 2,929,000 for March.

The deliveries direct from ship to craft have been—

	First Quarter.	March.
	P.s.h.	P.s.h.
Deals and battens - - -	7,063	2,153
Boards - - -	2,591	1,244
Total - - -	9,654	3,397

Soft Woods.

Swedish Deals and Battens.—The market both for deals and battens was very dull in London during March, and prices for the former have weakened here and there in the absence of demand. For battens prices have been maintained without change. For prepared boards the market has been much more lively, and the small stock has hardly proved adequate. Prices lifted materially during the month. Forward business has been on the smallest possible scale, but the lapses from established prices have neither been important nor significant.

Norwegian Boards.—The fresh arrivals in March to London were far below those of March last year. Prices progressed upwards through the month without bringing any signs of attracting larger supplies in the near future.

Russian Deals.—It was a difficult matter to keep the prices of Russian deals in London steady during March. The demand has been quite unsatisfactory, and but for the small stock and the absence of any pressure to sell, the weakness must have been more apparent. In further forward business little progress has been made, but rates have been fairly maintained on the whole.

Finnish Battens.—There is no change to report in this market for Finnish battens. Previous quotations have been maintained, both here and for arrival.

Prussian Timber.—The demand for fir timber continues to show fair activity, and in the absence now of any cheap competing supply market prices ought to be a good deal better than they are. There has, however, been no improvement so far. The market for foreign oak has also been disappointing, and the rally apparent in February has not been maintained.

Canadian Timber.—For pine deals there is no change to report in this market, the improvement reported for February having been maintained but not increased. For spruce deals there was quite a poor month's demand in London, and prices are more inclined to be a point down than anything else. Canadian hardwoods and yellow-pine timber have shown a little more cheerfulness. Quotations for sawn timber for arrival were again higher for the month, shippers being in great difficulties to find wood to fill their forward contracts. In London prices cannot get up to a parity with this state of affairs, but the small stock is going fast into consumption, and it is not easy to see on what basis it is going to be replaced. In the meantime, some sawn Oregon timber has been selling here very cheaply indeed. For pitch-pine planks the same causes are at work, but they have still less effect on prices in this market inasmuch as there is no general demand for them here and opportunities for selling them have to be competed for as they arise.

At the Birmingham Orthopædic Hospital a new outpatients' department is being erected. The department has a frontage to Great Charles Street of about 22ft., and extends backwards a distance of 85ft. The extra accommodation will comprise a waiting hall for outpatients, dispensary, dressing-rooms, surgeons', nurses', massage and exercising rooms, and two isolation wards.

Coming Events.

Wednesday, April 11.

EDINBURGH ARCHITECTURAL ASSOCIATION. — Associates' Annual Business Meeting.

JUNIOR INSTITUTION OF ENGINEERS.—Joint Meeting with the Discussion Section of the Architectural Association, at 18, Tufton Street, Westminster, at 7.30 p.m. Mr. S. Bylander, M.J.I.E., on "Ferrocement."

May 1. London, N.—Hot-water heating apparatus for Pavilion No. 1 at the Northern (Convalescent) Fever Hospital, Winchmore Hill, N., for the Metropolitan Asylums Board, in accordance with drawings and specification prepared by W. T. Hatch, M.I.C.E., M.I.M.E., engineer-in-chief. Drawings, specification, conditions of contract and form of tender may be inspected at the Office of the Board, Embankment, London, E.C., and obtained upon payment of a deposit of £1. Tenders, addressed as noted on the form, must be delivered at the Office of the Board not later than 10 a.m. on May 1.

May 16. Brussels.—Railway plant. For the construction of the Jodoigne to Esmael section of the local railway from Jodoigne to Tirlemont and St. Trond, and of buildings and roads in connection therewith. The estimated cost is 401,000 fr. (£16,040), and a deposit of 40,000 fr. (£1,600) is required. A copy of the specification may be obtained on payment of 1 fr. from M. Darveville, rue de Turquie, No. 18, Saint Gilles, Brussels. Tenders, in sealed envelopes, should be addressed to the General Manager, Société Nationale des Chemins de Fer Vicinaux, 14, rue de la Science, Brussels.

May 23. Brussels.—Railway plant. For the construction of the Gembeles to Graide section of the local railway from Rochefort to Wellin and Graide. The estimated cost is 205,000 frs. (£8,200), and a deposit of 20,000 frs. (£800) will be required. A copy of the specifications may be obtained for 1 fr. from M. Rigot, rue Lucien-Namèche, 39, Namur. Tenders, in sealed envelopes, should be addressed to the General Manager of the Société Nationale des Chemins de Fer Vicinaux, 14, rue de la Science, Brussels.

May 23. Bristol.—Electrically-driven hydraulic pressure pumps. Erecting in the existing engine-house, Underfall Yard, testing and maintenance for twelve months after completion, of three sets of electrically-driven hydraulic pressure pumps. Each set is to be capable of delivering 150 gallons of water per minute against an accumulator pressure of 750 lbs. per sq. in. The contract includes the pumping machinery, and also the electro motors and accessories, and gearing for driving the pumps. On and after Thursday, April 12, copies of the specification, form of tender, form of contract and copies of contract drawings can be obtained from W. W. Squire, Engineer's Office, Cumberland Road, Bristol, on production of a receipt from the secretary of the Docks Committee showing that £5 has been paid as deposit. Tenders must be enclosed in a sealed envelope, endorsed "Tender for Electrically-driven Hydraulic Pressure Pumps," and addressed to the Secretary of the Docks Committee, 19, Queen Square, Bristol, and must be delivered to him, accompanied by the prescribed documents, before 10 a.m. on May 23.

June 2. London, N.—Supply and erection of a refuse destructor complete in all respects, for the Southgate U.D.C. Copies of the specification and full particulars may be obtained from C. G. Lawson, C.E., surveyor to the Council, on depositing a Bank of England note for £5 with him. Sealed tenders, endorsed "Tenders for Refuse Destructor," must reach W. M. Ellener, clerk to the Council, Council Offices, Palmer's Green, London, N., not later than June 2.

IRON AND STEEL.

April 18. London, S.W.—Supply of the following materials for the Secretary of State for India:—Rails and fishplates, fishbolts, spikes. The conditions of contract may be obtained on application to the Director-General of Stores, India Office, Whitehall, S.W., and tenders are to be delivered at that office by 2 p.m. on April 18.

April 23. Sofia.—Steel nails, switching apparatus, bolts, &c., for the State Railway Directorate, Sofia, by whom tenders will be received up till April 23.

April 23. Belfast.—Supply of about two tons of best rolled steel girder tramway rails, with fish plates and bolts to suit, for the Harbour Commissioners. The section of the rail may be obtained from the harbour engineer, W. Redfern Kelly. The rails, &c., must be weighed on one of the Harbour Commissioners' weighbridges at the contractor's expense, and delivered on the county Antrim side of the harbour where pointed out. Sealed tenders, stating time of delivery, to be endorsed "Tender for Rails, &c.," and addressed to W. A. Currie, secy., Harbour Office, Belfast, by April 23.

April 24. London, E.C.—Supply of the following materials, for the Burma Railways Co., Ltd.:—(a) 8,176 tons steel rails, 60 lbs. per yd., and 425 tons fish plates; (b) 81 tons fishbolts; (c) 275 tons wrought-iron spikes. Specifications and form of tender may be obtained at the Company's Offices, 199, Gresham House, Old Broad Street, E.C. For each specification (a), (b) and (c) a fee of £1 will be charged, which will not be returned. Tenders, enclosed in sealed envelopes, and marked "Tender for Rails and Fish Plates," or as the case may be, must be delivered to A. G. Begbie, managing director, not later than noon on April 24.

April 30. Dublin.—Motor car shed 133ft. long by 44ft. wide of galvanized corrugated iron, &c., with steel principals at the Amiens Street Terminus, Dublin, for the Great Northern Railway Co. (Ireland). Parties wishing to tender for the work can see the drawings and specifications at the office of W. H. Mills, engineer-in-chief, Amiens Street Terminus, Dublin, or copies of them at the office of the District Engineer, Belfast, and forms of tender can be obtained at either of the above-mentioned places on payment of 1s. each (not returnable). Tenders made out on the forms supplied by the company, and endorsed "Tender for Motor Car Shed," should be delivered to T. Morrison, secy., Secretary's Office, Amiens Street Terminus, Dublin, not later than 10 a.m. on April 30.

May 16. Ploeshti.—Cast-iron pipes. For the supply of 16,200 metres cast-iron pipes of 500 to 200 millimetres for principal water conduits, and of 31,500 metres cast-iron pipes of 150 to 80 millimetres for secondary water conduits. A deposit equal to 5 per cent. of the value of the tender is necessary. Specifications may be obtained at the Mayorality, price 10 fr. Tenders to be sent to the Mayorality, Ploeshti, by May 16.

PAINTING AND PLUMBING.

April 12. Pontypridd.—Painting and decorating Peniel Calvinistic Methodist Chapel, Pontypridd, for the Trustees. Specification may be seen with Rev. W. Lewis, The Grove, Pontypridd. Sealed and endorsed tenders to be delivered to R. A. Lewis, Lloyd's Bank, Pontypridd, on or before noon of April 12.

April 12. Manchester.—Cleaning, painting and decorating the Municipal School of Art, Cavendish Street. Specifications may be obtained at the Municipal School of Technology, Sackville Street, Manchester, on a deposit of £1 1s. Tenders, addressed to the Chairman of the Education Committee, must be delivered at the Municipal School of Technology, Sackville Street, Manchester, not later than April 12.

April 12. Belper.—Painting at the Isolation Hospital. Specification can be seen on applying to the Matron at the Hospital. Tenders to be sent to Joseph Pym, clerk, Belper, not later than April 12.

April 12. London, S.E.—Cleaning and painting work at Newington Workhouse, Westmoreland Road, Walworth, S.E., for the Southwark Guardians. The specification can be seen and all information obtained at the offices of the Master of the Workhouse as above, between the hours of 10 and 4. Tenders, endorsed "Cleaning and Painting Work" should be addressed to the Guardians and delivered at the Union Offices, John Street West, Blackfriars Road, S.E., by 4 p.m. on April 12. Fair wages clause.

April 12. Warrington.—Painting part of the outside wood and ironwork at the Lancashire County Asylum. Persons desirous of tendering must measure up the work themselves, between 9 and 12 a.m. and 2 to 5 p.m. on any of the following days—the 28th, 29th and 30th inst. Tenders must be made up on forms, which can be obtained from H. Ellis, clerk, and must be delivered at the Asylum not later than 8 a.m. on April 12, addressed to "The Chairman," and endorsed "Tender for Painting."

April 12. Winchfield.—Supply of 5 tons of sheet lead (5 lbs. to the foot), carriage paid, to the Workhouse. Tenders, marked "Tenders for Lead," must reach W. H. Wright, clerk to the Guardians, Odiham, Hants, not later than 9 o'clock on April 12.

April 14. Barnstaple.—Painting the exteriors of the Albert Hall, Corn Market and Messrs. Bird's premises, for the U.D.C. Specifications may be seen at the office of Arnold Thorne, borough surveyor. Tenders, endorsed "Painting Albert Hall," will be received at the Town Clerk's Office on or before April 14.

April 17. Shrewsbury.—Supplying and fixing eleven slipper baths, with h. and c. water, supply pipes and valves, showers, waste pipes, &c. Specification and plan may be seen and printed form of tender and bill of quantities obtained at the office of the Borough Surveyor, on payment of £1. Sealed tenders, endorsed "Slipper Baths," to be addressed to W. Chapple Eddowes, borough surveyor, Borough Surveyor's Office, The Square, Shrewsbury, before 10 a.m. on April 17.

April 18. Macclesfield.—Outside painting to the north front of the main asylum buildings. Specifications and forms of tender (with copy of fair wages clause annexed) can be obtained on application to H. Beswick, county architect, Chester, and tenders must be endorsed "Tender for Outside Painting" and sent to A. C. Procter, clerk to Committee of Visitors, 23, King Edward Street, Macclesfield, by April 18.

April 19. London, N.—Whitewashing, &c., at the infirmary, Highgate Hill, N., in accordance with specification and conditions of contract, copies of which may be obtained on application to the Steward there between 8.30 a.m. and 5 p.m., up to April 15. Tenders must be sealed up, addressed to the Guardians, and delivered at the Guardians' Offices, St. John's Road, Upper Holloway, N., not later than 4 p.m. on April 19, endorsed "Whitewashing."

April 21. Blaydon.—Painting and colouring the following schools during the Midsummer recess:—Dunston Council, Swolwell Council, Martey Hill Colliery Council, Blaydon Council (Boys' and Girls' Department) High Spen Council. Specifications and forms of tender, to be returned not later than April 21, may be obtained from I. George Maguire, 7, Wallace Terrace, Ryton-on-Tyne.

ROADS AND CARTAGE.

April 12. Gravesend.—Supply of the following road materials:—Basalt or Penlee Elvan stone, Cherbourg quartzite, best pressed Staffordshire blue bricks, Penmaenmawr granite, and Kentish ragstone chippings. Specification, form of tender and all other information may be obtained on application at the office of the borough surveyor, F. T. Grant, Town Hall, Gravesend. Sealed tenders, which will only be received on the form supplied, endorsed "Tender for the Supply of—," must be delivered at the Town Clerk's Office not later than April 12, with samples of the materials which it is proposed to supply.

April 13. Helston.—Steam-roller, scarifier, stone-crusher, water-cart and living-van for the R.D.C., as follows:—One 10-ton compound steam road-roller (convertible into a traction-engine if required, but the Council do not now invite tenders for traction wheels) with all necessary tools, together with a winding drum and wire rope; a road scarifier such as would be usually affixed to a 10-ton roller as aforesaid; a portable stone-crusher with all necessary belts and tools. Parties tendering for the supply of this machine should quote for machines of the following size at the mouth, viz.:—16ins. by 9ins., 14ins. by 8ins., 12ins. by 8ins., and should also give the weight of each machine, the width of wheels of which should not be less than 6ins.; a water-cart to contain about 200 gallons; a travelling or living-van for two men, complete with all and every necessity for immediate use. Tenders, with copies of the specification of each kind of machine, van or cart tendered for, should be sent to A. E. Ratcliffe, clerk of the Council, Helston, by April 13.

April 14. Sutton Bridge.—Supply of the following road materials, for the U.D.C.:—XX granite, 202 tons; X granite, 81 tons; 1½in. slag tailins, 186 tons; granite chips, 40 tons; paving sand, 20 tons; shingle, 170 yds.; 1½in. ballast, 82 tons; Wansford stone, 80 yds. Tenders, marked "Tenders for Road Material," to be sent to L. C. Harvey, clerk to the Council, Holbeach, Sutton Bridge, by April 14. Samples to be sent to the Surveyor, Oddfellows' Hall, Sutton Bridge. No form of tender supplied.

April 17. Chelmsford.—Granite and team labour for the Town Council, as follows:—Granite: 1,500 tons of granite (more or less as the Council may require), uniformly broken to a 1½in. gauge, to be delivered either at the Chelmsford Station of the Great Eastern Railway, or on to the wharf of the Chelmer and Blackwater Navigation Co., Springfield, near Chelmsford. Tenders to state prices for contracts for periods of one, two and three years; team labour, for the period ending 25th March, 1907. The contractor will be required to water such of the roads within the district, and also to do any carting that may be required at such times as the Borough Surveyor may direct, and provide horses, harness and men necessary for that purpose, the carts being provided by the Council. Tenders must state price per day. Should it be necessary for the contractor to provide a cart, gd. a day will be allowed for the same. The contractor will be paid for the time actually worked on the roads, whether a full day or not. Further information may be obtained of Cuthbert Brown, borough surveyor, 16, London Road, Chelmsford. Tenders, endorsed "Tender for Granite" (with samples of granite) or "Team Labour," to reach the Town Clerk's Office by noon on April 17.

April 18. Denton.—Forming, sewerage, draining, ballasting, kerbing and other work required in the extension of Acres Street. Plans, specifications, &c., may be seen and bills of quantities obtained at the office of E. Garside on payment of a deposit of 10s. Sealed tenders, endorsed "Tender for Acres Street," to be delivered to Edward Garside, A.M.I.C.E., Town Hall Chambers, Ashton-under-Lyne, not later than April 18.

April 19. Bromley.—Tar paving about 1,650 yds. super.; breaking-up and re-topping about 3,160 yds. super.; and re-topping about 2,824 yds. super., in accordance with the specification prepared by the Borough Engineer. Materials to consist of Kentish limestone, and to be manufactured within twenty-five miles of Bromley. Specification and form of tender may be obtained on payment of 10s. 6d. at the Town Clerk's Office. Tenders, endorsed "Tar Paving," must be delivered to F. B. Norman, town clerk, Bromley, Kent, not later than 3 p.m. on April 19.

April 19. Houghton-le-Spring.—Supply of machine-broken blast furnace slag and slag riddings. Full particulars as to quantity, quality, dimensions and places and times of delivery, with forms of tender, may be obtained from the surveyor of the Council, D. Balfour, M.I.C.E., Houghton-le-Spring, R.S.O. Sealed tenders, addressed to the Chairman of the Highways Committee, R.D.C. Offices, Houghton-le-Spring, R.S.O., endorsed "Tenders for Road Material," to be sent not later than 10 a.m. on April 19.

April 20. Ripon.—Team labour for the R.D.C., for the period of twelve months. For full particulars, see posters, and for forms of tender apply to the surveyor, J. W. Plewes, 16, Ure Bank Terrace, Ripon. Tenders, marked "Team Labour," to reach Charles F. P. Edmundson, clerk to the Council, Ripon, not later than April 20.

April 20. Preston.—Levelling, paving, flagging, channelling and making good Great Townley Street, Dunderdall Street, Cave Street, Redmayne Street, Samuel Street, Lowndes Street and Emmanuel Street. Plans, sections and specifications may be seen and schedule of quantities and forms of tender obtained at the office of the Borough Surveyor, Town Hall, Preston, to whom sealed tenders, endorsed "Tender for Paving, &c.," must be delivered not later than noon on April 20. Fair wages clause.

April 21. Harrow-on-the-Hill.—Making-up the following private streets:—Butler Road (part 2), Vaughan Road (part 2), Merivale Road, Bowen Road, Heath Road, Alma Road, Alma Crescent and Waldron Yard. Drawings may be seen and specifications, quantities and forms of tender obtained from J. Percy Bennetts, engineer and surveyor to the Council, on a deposit of a £5 Bank of England note. Sealed tenders, on the forms supplied, endorsed "Private Street Works," to reach John Strachan, clerk to the Council, by April 21.

April 21. Oakham.—Supply of granite and slag, for the R.D.C., as follows:—Ashwell, 680 tons granite, 30 tons slag; Ketton, 505 tons granite, 30 tons slag; Luffenham, 200 tons granite, 40 tons slag; Manton, 422 tons granite, 30 tons slag; Oakham, 2,505 tons granite, 500 tons slag; Stamford, 175 tons granite; South Witham, 805 tons granite; Whissendine, 330 tons granite, 50 tons slag. The material is to be delivered free of charge and at the contractor's risk, in such quantities and at such times as the Council shall from time to time require. The contractors will be paid quarterly. Forms of tender, with specifications and conditions of contract may be obtained at the Clerk's Office, Catmose Street, Oakham. Samples, addressed to the Board-room, Oakham, are to be delivered free, not later than April 21. Sealed tenders, marked "Materials," are to be delivered at the Clerk's Office not later than 4 p.m. on April 21.

April 21. Oakham.—Team labour required in the repair and maintenance of the highways and main roads in the rural district. Tenders may be sent in for the whole or any part of the team labour. Forms of tender, with conditions of contract, may be obtained at the Clerk's Office in Oakham. Sealed tenders, marked "Team Labour," are to be delivered to William Batts, clerk to the R.D.C., Catmose Street, Oakham, not later than 4 p.m. on April 21.

April 23. South Moor.—Execution of works in the formation of several private streets, for the Stanley U.D.C. Plans, sections and specifications may be seen and quantities and forms of tender obtained from J. Routledge, surveyor, Council Offices, Stanley, on the 11th, 16th, and

23rd instants, between 10 a.m. and 3 p.m. Sealed tenders, endorsed "Street Works," to be sent to John G. Ridley, clerk to the Council, Stanley, R.S.O., by April 23.

April 23. London.—For the following paving work, for the Corporation, according to the specifications to be seen at the office of the Engineer to the Corporations where forms of tender may be obtained:—Carriageways to be paved with asphalt: London Wall (Moorgate Street to Blomfield Street), Cheapside (Ironmonger Lane to Newgate Street), Finsbury Pavement, Moorgate Street (London Wall to Telegraph Street), Kingham Street, Beech Lane, Aldermanbury Avenue. Footways to be paved with asphalt: Finsbury Pavement (west side—Short Street to Ropemaker Street), Billiter Street (half east side), Farringdon Street (Ludgate Circus half-way to Plumtree Court), Ludgate Circus (N.E. and S.E. Quadrants). Carriageways to be paved with wood: Old Bailey, Plumtree Court, Finsbury Circus (Circus Place to West Street), Goddard Street (St. Paul's Churchyard to Knightbridge Street), West Smithfield. Carriageways to be paved with stone: Dowgate Dock, Bush Lane, Little Bush Lane. Footways to be paved with stone: West Smithfield, west side (Giltspur Street to Long Lane), London Wall (Moorgate Street to Blomfield Street), Farringdon Street (both sides from the end of the asphalt to Plumtree Court), Billiter Street (half east side). Maintenance.—Carriageways: Lawrence Lane, Milk Street (north end) Milk Street (south portion), Wood Street (Gresham Street to Cheapside), Wood Street (Gresham Street to Adde Street), Friday Street (Cannon Street to Knightbridge Street), Broad Street (Watling Street to Queen Victoria Street), Bucklersbury (Cheapside to Queen Victoria Street), Carter Lane (west of Creed Lane), Dorset Buildings, Aldermanbury Postern, Jewin Crescent, Fore Street Avenue, Moorfields, Ropemaker Street, Moor Lane, South Place, St. Helen's Place, Devonshire Street and Square, Duke Street, Aldgate, Goring Street, Catherine Wheel Alley, Ellison Street, Sandy's Row, Whittington Avenue, London Street, Cornhill, Throgmorton Street. Footways: Mason's Avenue, Redcross Street (west side), Edmund Place, Throgmorton Street, Bucklersbury (Queen Victoria Street to Walbrook), Old Jewry, Chapel Place, Nicholas Lane, Ingram Court, Fenchurch Street, Bell Yard, Gracechurch Street, Hart Street and Crutchedfriars. Tenders must be on the before-mentioned forms, and must be addressed Town Clerk, Public Health Department, and delivered at the office of the Hallkeeper, Guildhall, between 12.30 and 1.30 p.m. on April 23.

April 24. Desborough.—Supply of about 300 tons of granite, delivered at Desborough Station, Midland Railway, for the U.D.C. Forms of tender may be had on application to D. J. Diver, surveyor, to whom samples are to be sent. Tenders, endorsed "Tender for Granite," are to be delivered at the Surveyor's Office by April 24.

April 27. Rawdon.—Supply of the following road-metal, broken and unbroken, during the year ending Mar. 31, 1907 to be delivered at Yeaton Railway Station as and when required by the U.D.C.:—Whinstone macadam; granite macadam; dark blue limestone macadam; dark blue limestone macadam, unbroken. Sealed tenders, marked outside "Road Metal," must be delivered by post or otherwise to John H. Pratt, Royal Bank, Rawdon, by April 27.

May 24. Aldershot.—Granite for the U.D.C. For the supply, free on rail at either the London and South Western Railway or South Eastern and Chatham Railway Stations, Aldershot, of 1,300 ft. run of 12 in. by 6 in. dressed, flat, granite kerbing, and 1,000 ft. of 12 in. by 6 in. Kemton or blue pennant channelling all in lengths of not less than 33 in. by 6 in. Tenders, endorsed "Kerb and Channelling," stating the price per foot of each material, to be sent to F. C. Uren, district surveyor, Aldershot, on or before April 24.

SANITARY.

April 16. Motherwell.—Proposed outfall sewer from Orbiston Street to Todhole Burn, for the Town Council. Providing and laying of about 275 lineal yds. of 18 in. fire-clay pipes and about 1,480 lineal yds. of 15 in. fireclay pipes, together with the construction of the necessary manholes, &c. Drawings and specification may be seen at the Burgh Engineer's Office, Town Hall, Motherwell, where copies of the schedule may be had on payment of 2s. Sealed tenders, marked "Outfall Sewer to Todhole Burn," must be lodged with James M'Callum, engineer, Town Hall, Motherwell, not later than noon on April 16.

April 23. Blackburn.—Erection of a sewage pumping station at Witton Eyes, within the borough of Blackburn. Specification, bill of quantities and form of tender may be obtained at the Engineer's Office. Sealed tenders, properly endorsed, to be delivered to William Stubbs, A.M.I.C.E., borough and water engineer, Municipal Offices, Blackburn, not later than noon on April 23.

April 23. Macroom.—Construction of sewerage works in accordance with plans and specification prepared by A. W. Barnard, C.E., to be seen at the Clerk's Office. Sealed tenders, addressed to the presiding chairman, and containing the names of two solvent sureties willing to enter into a bond with the contractor for double the amount, of the contract for the due and faithful fulfilment of same, to be lodged in the tender box in the Council Office up to 4 p.m. on April 23. A sum of £10 in cash to be lodged with each tender, which will be returned on completion of the bond.

April 23. London.—Destroying and filling-in disused sewer in Finsbury Pavement (between London Wall and West Street) according to specification and plan to be seen at the office of the Engineer to the Corporation, Guildhall, where forms of tender may be obtained. Tenders must be on the before-mentioned forms, and must be addressed Town Clerk, Public Health Department, and delivered at the office of the Hallkeeper, Guildhall, between 12.30 and 1.30 on April 23.

April 25. St. Columb Minor.—Construction of sewers, from 7 ins. to 6 ins. in diameter, with manholes, lampholes and other appurtenances, and for certain works in connection with the preparation of lands for sewage irrigation, for the R.D.C. The total length of sewer is

intended to be about 2,500 yds. General and detail drawings may be seen, the specification examined, and bills of quantities obtained at the office of the engineer, R. Hansford Worth, 42, George Street, Plymouth. All tenders must be delivered in sealed envelopes, endorsed "Tenders for St. Columb Minor Sewerage," accompanied by fully priced out and totalled bills of quantities, and addressed to Charles E. Whitford, clerk, Fore Street, St. Columb Major, Cornwall, by April 25.

April 30. Carlisle.—Sewage-disposal works. Contract No. 1: The erection and construction of pumping station, sedimentation tanks, filters, &c. Contract No. 2: Centrifugal pumps, motors, switchboards, &c. Contract No. 3: Sewage screens, elevators with motors. Parties desiring to submit tenders may inspect the drawings and conditions of contract and obtain specification, bills of quantities and forms of tender and other particulars upon application to H. C. Marks, city engineer, on deposit of the sum of £5 in the case of Contract No. 1 and £2 2s. in the case of each of the Contracts Nos. 2 and 3. Tenders must be on the official forms, and the printed instructions contained therein must be strictly complied with. Each tender, in a sealed envelope, together with the filled-up bill of quantities, must be endorsed "Tender for Sewage Works," and delivered to Henry C. Marks, M.I.C.E., city engineer and surveyor, 36, Fisher Street, Carlisle, not later than 10 a.m. on April 30.

April 30. Middleton.—Construction of three circular tanks, catchpits, conduits, &c., at the Sewage Outfall Works at Rhodes. Plans may be seen and specifications, quantities and form of tender (which includes a fair wages clause) obtained on and after April 5 by applying to W. Welburn, borough surveyor, Town Hall, between 9.30 and 10.30 a.m., on depositing £1 rs. Tenders, endorsed "Tender for Tanks," are to be addressed to the Chairman of the Surveyor's Committee, and delivered at the Town Clerk's Office on or before April 30.

May 2. Hayes.—Construction of 8 1/2 lineal yds. of 12 in. diameter and 156 lineal yds. of 9 in. diameter cast-iron pipe sewers, and 953 lineal yds. of 9 in. diameter glazed stoneware sewers, together with all necessary manholes and other contingent works, to be laid in Wood End Green, Angel Lane, Morgan's Lane, and Grange Road, within the said district. Drawings may be seen and specification, bill of quantities and form of tender obtained at the Surveyor's Office upon the deposit of the sum of £2. Sealed tenders, endorsed "Tender for Sewers," and addressed to "The Chairman of the Works Committee," must be sent in to C. Dudley-Lewis, clerk, Council Offices, Hayes, Middlesex, not later than 4 p.m. on May 2.

No date. Cienfuegos.—Construction of an aqueduct and sewerage works for the municipality. A public call for tenders will be made for carrying out a portion of these works at the upset price of—(1) aqueduct construction, 1,754,325 dollars (about £350,805); (2) sewerage works, 788,275 dollars (about £157,655), in accordance with plans which will be on view at the offices of the municipality when the date of the adjudication is announced. Tenders will be received for either or both of these works.

April 18. Wakefield.—Construction of main pipe sewers, together with the necessary manholes, and other appurtenant work; and also for disposal works for the treatment of the sewage at Walton, for the R.D.C. Plans and specifications may be seen and forms of tender obtained at the office of Frank Massie, M.I.C.E., on payment of £2 2s. Tenders, properly endorsed "Tender for Walton Drainage," to be delivered to H. Beaumont, clerk to the Council, Tetley House, 47, Kirkgate, Wakefield, not later than 10 a.m. on April 18.

TIMBER.

No date. London, E.C.—Australian hardwood. An Austro-Hungarian firm requires lowest quotation for and samples of blocks of Australian hardwood in dimensions of 9 by 3 by 4 English in., delivery to be effected not later than the end of April. For further particulars application should be made by letter to the Secretary, Austro-Hungarian Chamber of Commerce, 29, Martin's Lane, Cannon Street, E.C.

MISCELLANEOUS.

April 16. Wigan.—Supply of the following stores for the Gas Committee:—Wrought-iron tube and fittings; brass and copper tube and fittings; lead gas pipe; street lamps; merchant iron; shovels and coke forks; wood troughing and covering; galvanized stove pipe and connections; cast mains and connections; screw and retort bolts; galvanized buckets. Forms of tender may be obtained from J. Simmins, engineer, Gas Works. Tenders, sealed and endorsed with the name of the article tendered for, to be delivered to Harold Jevons, town clerk, Town Hall, on April 16. A sample of each article to be forwarded, addressed to the Gas Engineer.

April 23. Glasgow.—Supply of the following materials, for the Electricity Department:—Main cables; small cables and wires; electricity meters; and carbons for a period of twelve months. Copies of the specifications and forms of tenders may be obtained on application to W. W. Lackie, engineer, 75, Waterloo Street, Glasgow, on making a deposit of £2 for each specification. Sealed offers, marked "Electricity Department, Tender for—," and addressed to A. W. Myles, town clerk, City Chambers, Glasgow, by April 23.

April 30. Wolverhampton.—For the following works, for the Education Committee:—Painting of schools; building work in connection with the installation of heating apparatus, Willenhall Road School; asphalt and repairing playgrounds. Particulars and conditions may be obtained on application to T. H. Fleeming, architect to the Committee, 10, Queen Square, Wolverhampton. Tenders addressed to "The Chairman, Sites, Buildings and General Purposes Sub-Committee, Education Offices, Town Hall, Wolverhampton," must be received not later than April 30. Fair wages clause.

NEW LONDON BUILDINGS.

At yesterday's meeting of the London County Council the Building Act Committee reported the following applications under the London Building Act, 1894, their recommendations as to consent or refusal being appended in *italics*:—

Addition to the porch in front of No. 9, Cambridge Place, Victoria Road, Kensington, on the application of Totten & Willett, on behalf of Simpson, Rushforth & Co. (*Consent.*)

Retention of a projecting sign in front of No. 184, Brompton Road, Kensington, on the application of Boynton, Sons & Trevor, on behalf of Cox & Yeman, Ltd. (*Consent.*)

Iron and glass shelter in front of St. George's Hall, Langham Place, Marylebone, on the application of J. G. Buckle, on behalf of J. N. Maskelyne. (*Consent.*)

Porch in front of Nos. 33 and 35, Plumstead Common Road, Plumstead, on the application of F. J. Gurney, on behalf of the Plumstead Common Road United Conservative and Unionist Club. (*Consent.*)

Porches to five houses on the eastern side of Latchmere Road, Lavender Hill, on the application of W. L. Ingram, on behalf of J. Jenkins. (*Consent.*)

Retention of an iron and glass hood over the entrance to No. 22, West Kensington Mansions, North End Road, Fulham, on the application of Clarke & Co. (*Consent.*)

Buildings on the north side of Half Moon Lane, Dulwich, to abut also upon Holmdene Avenue, on the application of W. Graham, on behalf of the trustees of the late Henry Fisher. (*Refusal.*)

Dwelling-house and a one-storey office building on the western side of Harvey Road, Camberwell, southward of No. 6, with external walls at less than the prescribed distance from the centre of the roadway of the street, on the application of W. Smith. (*Consent.*)

Building on the southern side of Lamerton Street, Greenwich, with external walls at less than the prescribed distance from the centre of the roadway of the street, on the application of F. J. Gorham. (*Consent.*)

Retention of an iron and glass porch in front of No. 4, Addison Road, Kensington, on the application of E. K. Purchase, on behalf of A. du Cros. (*Consent.*)

Bringing forward of the frontage of No. 142, Piccadilly, and the erection of a porch and balcony in front of such building, on the application of Thurgood & Martin, on behalf of Miss A. de Rothschild. (*Consent.*)

Deviation from the plans approved on December 12th, 1905, for the erection of two glass and iron shelters at the Aldwych Theatre, to abut upon Aldwych and Drury Lane, Strand, so far as relates to an alteration in the construction of the shelter at the main entrance to the theatre, on the application of W. G. R. Sprague. (*Consent.*)

Extension of the period within which the erection of six houses and shops on the site of No. 174, Lavender Hill, and houses on the east side of Latchmere Road, Battersea, was required to be completed, on the application of W. L. Ingram. (*Consent.*)

Two iron and glass shelters at the Kennington Theatre, Kennington Park Road, Newington, on the application of McVeay & Co., on behalf of R. Arthur. (*Refusal.*)

Iron and glass shelter in front of Nos. 161A and 166, Strand, on the application of R. J. Worley, on behalf of The Colonnade, Ltd. (*Refusal.*)

Porch in front of No. 213, King's Road, Chelsea, on the application of D. Blow. (*Refusal.*)

Buildings on the site of Nos. 321 and 323, Oxford Street, to abut also upon Dering Street, on the application of Gordon & Gunton, on behalf of Hitchings, Ltd. (*Consent.*)

External wood and iron staircase at the rear of No. 13, Great James Street, Holborn, to abut upon Cockpit Yard, on the application of C. I. Jones, on behalf of G. Angold. (*Consent.*)

Buildings on the site of No. 11, Philpot Street, Stepney, to abut upon Nelson Street, on the application of E. H. Abbott, on behalf of C. Martin. (*Refusal.*)

New streets for carriage traffic on the Fairfield House estate, Tooting, to lead from Mitcham Road to Totterdown Street, and in connection therewith the widening of a portion of Mitcham Road, on the application of W. C. Poole, on behalf of Ayre & Kingcome. (*Consent.*)

Extension of the time within which the roadways of proposed new streets for carriage traffic out of the east side of Merton Road, Wandsworth, were required to have been clearly defined throughout by posts and rails or so otherwise as the Council should permit and thrown open to the public as highways, on the application of C. W. Braine, on behalf of the Wandsworth & Putney Gas Light & Coke Co. (*Consent.*)

Plans as amended on the application of H. Mair, on behalf of the Hammersmith Metropolitan Borough Council, for the construction of additions at the generating station, Fulham Palace Road, Hammersmith. (*Consent.*)

The Theatres and Music Halls Committee also reported the following:—

Extension of the period within which the erection of a music hall building on a site abutting upon the east side of High Street and north side of Limes Grove, Lewisham, was to have been commenced, on the application of W. Stephens. (*Consent.*)

Drawing submitted by Wylson & Long, showing certain alterations which it is proposed to carry out at the Oxford Music Hall with a view to preventing the gangways on each side of the stalls being used for standing room. (*Consent.*)

Drawing submitted by G. J. Earle, showing a proposal to extend the platform at the Queen's Park Hall, Harrow Road. (*Consent.*)

Drawing submitted by J. Jeffrey, showing the proposed construction of a room, to be used for postal purposes only, over the existing post and telegraph office at the Royal Agricultural Hall, Islington. (*Consent.*)

HALL'S SANITARY WASHABLE DISTEMPER

The Modern Wall Covering.

The most popular wall covering of to-day is Hall's Sanitary Washable Distemper. It works easily, sets hard and dries with a uniform surface, equal to flatted oil paint.

It is made in 73 colours, including rich dark as well as light shades.

One cwt. of Hall's Distemper mixed with water to the consistency of cream, will cover double the surface of one cwt. of pure White Lead Paint and save 40 per cent. of the cost of labour.

"Sisco" White Japan is the correct material for painting Doors, Picture Rails, and all Woodwork of rooms decorated with Hall's Distemper. "Sisco" Japan is a pure white decorators' enamel, which dries with a hard smooth ustrous surface. It lasts for many years with beauty unimpaired.

FIRE SUPPLEMENT (MONTHLY).

THE LONDON FIRE RECORD.

THE annual report on the London Fire Brigade for 1905, which was issued last week by the London County Council, makes interesting reading.

In the preface by the chief officer special attention is called to the fact that in almost every instance the lives lost by fire were due to carelessness and the lack of ordinary precautions against fire, such as fire-guards, &c., which apparently no efforts on the part of the fire brigade—after the call was received—could have minimized.

Attention is called to the fact that most of the serious fires in which the cause is described as unknown were probably due to spontaneous combustion, owing to the lack of proper iron receptacles for oily and general rubbish, which materials should always be kept separate.

It is pointed out that if the suggested amendment to the London Building Act as to prevention of the spread of fire, as proposed in the Council's Building Act Amendment Bill of 1905, were made law, the danger of large fires would be considerably minimized, and we certainly fully endorse this observation.

From our point of view one of the interesting features in the recent development of the fire brigade has been the attention accorded to the fire-preventive side. Theatres, lodging-houses, large factories, tube railways, certain Government property, and the like, now come under the inspection of the brigade's superior officers, who have been lately supplemented by several mechanical and electrical engineer assistants, who deal particularly with the engineer's aspect of the work.

With this increasing necessity for attention to the fire-preventive side, the number of superior officers must naturally be increased gradually, and the only point that we regret in the Council's recent policy is the veto put upon it from the Finance Committee as to the appointment of a further assistant divisional officer.

In the evolution of the brigade and the development of its resources everything certainly appears to be eminently satisfactory. The introduction of the motor steam fire-engine, the introduction of the soft long ladder and other modern appliances are steps in the right direction. As to the actual working of the brigade and its efficiency in tackling fires we have had occasion several times to record during the past year the very excellent work done under exceptional difficulties, and "stops" made which not only impressed those conversant with the subject at home but also abroad.

As to figures, the London Fire Brigade has now 75 land stations and 5 river stations. It has 78 land steam fire-engines, 2 motor steam fire-engines and 5 floats. There are 1,150 public fire-alarms available. The number of fires in 1904 was 64 serious and 3,447 slight fires; making together 3,511. Under the heading "serious" fires the follow-

ing points are considered, namely, the nature and approximate amount of damage, the surrounding risks, the class of stock, and estimated value, description of the building, hydrants and appliances at work, and loss of life. This, we believe, is a somewhat different classification to what has been common hitherto, when the classification we think was according only to the number of hydrants used.

As to the known causes of fire, 677 are described as due to lights thrown down. The summary of the causes of fire says that considerable attention is being paid to enquiring into the causes, for only 419 out of 3,511 fires are recorded as "cause unknown."

In examining the list of fires in detail we observe that there were 178 fires within the area of the City, and that of these 178, thirteen are classed serious. This means that about one-fifth of the serious fires of London occur in the City proper. The proportion of fires in the City area is too high.

POPULARIZATION OF FIRE-PROTECTION.

NOTHING could do more towards popularizing the subject of fire-protection than the series of Cantor lectures given by Prof. Vivian Lewes at the Society of Arts. These Cantor lectures, which are arranged under the terms of a bequest, were this year of a most exceptional character, and their only regrettable feature was the short duration of the time limit, namely, one hour, and the small number of lectures available, namely, only four. Supplemented by experiments, presented in a most entertaining manner, fire-protection would verily be a most popular subject if it always had such an excellent exponent as the learned professor.

Speaking generally, no one could but be in agreement with the Professor's arguments and their moral, but we think he was not quite in touch with modern fire-preventive practice when he generalized in his condemnation of fire-resisting buildings. It is popular in certain fire-service circles to scoff at faulty building construction, more particularly at that which goes by the misnomer of "fireproof," but there is no doubt about it that there are numerous modern forms of construction which are fire resisting to a very high degree, and which have stood both in experimental and in actual fire the severest tests of high temperature and severe flame. No better example could have been presented than those given in an earlier supplement of the fire at Glasgow, when the entire contents of a very large drapery business were entirely burnt out and yet the whole of the construction practically remained intact—concrete floors and all—so that only a certain amount of making good, refurbishing and painting was necessary to put the building into working order again.

Recent experiments have also shown that

the due observance of small matters of detail is frequently most effective in results in fire-resistance. Allowance of space for expansion, careful selection of aggregates, and similar small matters are essentials in fire-resisting construction. A general condemnation of concrete by Professor Lewes was thus scarcely in place, though a general condemnation of unsuitable concrete would have been quite apropos. Thames ballast concrete is notoriously inefficient as a fire-resistant; clinker and several other forms of concrete eminently serviceable.

In dealing with the question of fire-prevention we are, however, pleased to see that Professor Lewes pointed out the necessity of discriminating between the fire-resistance necessary in a villa or residential property as distinct from that in a warehouse or factory building. It is this lack of discrimination that has been so unfortunate in the development of fire-preventive methods, and we trust the classifications under the universal standards of "temporary protection," "partial protection" and "full protection," which has now found favour amongst those best conversant with the subject in Great Britain and on the Continent, as also in the United States, will do much to put an end to some of the old misnomers.

Lastly, one word on "flameproof" or "non-inflammable" wood. Professor Lewes devoted quite half of his last lecture to that subject. We have from the outset been strong advocates of the usefulness of properly prepared "flameproof" wood if thoroughly impregnated with suitable chemicals. We have also frequently pointed out the expense of using treated wood, as compared with non-treated wood, may be heavy if the one material *versus* the other be compared, but the expense on the total outlay on a building is small. It would be well if Professor Lewes's strong advocacy of this important question of the usefulness of flameproof wood obtained a wide hearing.

RAILWAY FIRES.

MENTION has been made twice during the past few weeks at the London County Council of fires on the electrified railways, namely, on the District and Metropolitan Railways.

We do not know if the rules of the Board of Trade are retrospective, *i.e.*, whether these useful regulations which are applied to new tube railways, and which have been most efficiently applied to the Baker Street and Waterloo Railway which has just been opened, are also brought into force for existing lines like the Metropolitan and District Railways. If not, some special legislation is necessary, for we are afraid that both these lines do not quite come up to modern ideas as to fire-protection, and we understand that even in the carriages of the Metropolitan Railway there is still a very considerable amount of ordinary woodwork, which is, of course, *ipso facto*, a grave error and a serious responsibility for the management.

FIRE AT ROBINSON'S WAREHOUSE, BRISTOL.

THE RECENT BRISTOL FIRE.

LAST year we had several times occasion to refer to the fires at Bristol and to there being something radically wrong in the fire-protection of that city. As far as we can make out, the extent of the large fires of last year was mainly due to lack of proper separation between individual risks, a separation which could have been easily effected under the existing regulations if these regulations had been enforced and had not been merely on paper.

We now have another fire to record, namely, that of Messrs. Derham's boot factory, involving considerable loss of property, disorganization of business, and throwing (according to the local press) about 500 people out of work.

Need for Reform.

A succession of fires of this description points only too plainly to the need of urgent revision of the fire-preventive arrangements, a re-modelling of certain building regulations, and a strict enforcement of the rules already available. It is indeed regrettable that so much property should be wasted, so much business disorganized and so many made workless when preventive methods should have done much to minimize the loss and perhaps have prevented it entirely.

As to the fire-brigade aspect of the question, this is scarcely within our scope, but it would certainly seem that a stronger brigade and heavier equipment in up-to-date appliances would not be inappropriate. Bristol is getting quite a bad reputation on this question of fires in its industrial districts, and we are afraid the insurance companies will soon have to raise their rates if this state of affairs continues.

Description of the Fire.

The location of this fire is easily explained from the accompanying plan. The structure does not perhaps lend itself for illustration for technical purposes as much as some of the

other Bristol fires we have illustrated, but one of the remarkable features in this case was the manner in which the fire spread to adjoining premises. The plan indicates how the sparks spread, and had it not been for various favourable circumstances Bristol might very well have had a great conflagration.

Another Bristol Fire.

Whilst referring above to the recent fires at Bristol we think we should also reproduce an illustration of a notable fire that occurred a few years back at Messrs. Robinson's warehouse in Victoria Street, Bristol. This was one of the worst burn-outs on record in Bristol and district, and the photographs very clearly show to what extent the premises were gutted. An interesting feature of one of the photographs is the protection afforded by certain iron doors, which, although apparently buckled, kept their position well.

The Building Act Amendment Bill is now receiving the careful attention of the Building Act Committee of the London County Council, and a draft may be shortly expected to be laid before that body.

The Milan International Fire Congress has been timed to open on May 28th, and the second day of the meeting will be devoted to a discussion on the question of the fire-resistance of reinforced concrete.

Mr. James Sheppard, A.I.E.E., one of our contributors and a member of the Executive of the British Fire Prevention Committee, has been awarded the gold medal "For Zeal" with the ribbon of St. Stanislaus, by His Imperial Majesty the Czar, the King having granted permission for this distinction to be worn.

FIRE AT ROBINSON'S WAREHOUSE, BRISTOL.

FIRE TESTS.

Impending Tests.

THE arrangements of the British Fire-Prevention Committee for tests during the current month include the testing of a reinforced concrete floor and a steel roller shutter to a window opening.

Regarding the reinforced concrete floor, this will be one on the Coignet system, and the section under test will measure 15ft. by 22ft. We understand it was the intention of the designers to plan this floor under fire office rules, thus protecting the steelwork with concrete to a greater extent than has been common practice up to the present. The concrete to be used is, we understand, slag concrete with "Ferrocete" cement. The test applied for is that of the "full protection," class B, namely, a four hours' test, followed by the application of water from a steam fire-engine for five minutes, the temperature to range above 1,800 degs. Fahr. The same designers put forward a floor some little time back, which was under test for three hours.

Regarding the roller shutters for window openings, we understand it is the "Kinnear" pattern of shutter that will be under test, put forward by Messrs. Arthur L. Gibson & Co. It is intended to afford protection to ordinary deal windows glazed with ordinary 32oz. glazing, and to show to what extent such shutters will afford protection to ordinary windows.

Impending Reports.

Regarding reports on tests completed, we understand that two reports on tests will be issued in the course of a few days, on the experimental tests with concrete floors supported by broad-flange girders, the floors being respectively of Thames ballast concrete and of clinker concrete, the broad flange girders having been provided by Messrs H. J. Skelton & Co. These reports will be issued simultaneously and are an important contribution to experimental work on the question of fire-resistance undertaken by the Committee.

AN IRON DOOR THAT HAS WITHSTOOD A SEVERE FIRE.

Later in the month we understand the report will be issued regarding the test which was recently undertaken with a floor of the New Expanded Metal Co., in which broken-brick concrete was used.

In May these reports will be followed by two reports on reinforced concrete floors on the Coignet system, in which—as mentioned above—in one instance slag concrete will be used, whereas in the previous instance we believe clinker-concrete was used.

The series of reports on floor tests with the different concrete aggregates should form a useful collection, and their particular advantage is that they are full-sized tests, as distinct from laboratory tests—that is to say, the smallest section of any of this concrete work measured 10ft. by 22ft.

IRON DOORS.

OUR attention has been called to the fact that although iron doors have many serious disadvantages owing to their great weight, which very often prevents their being closed when they ought to be closed, and owing to the lack of suitable fastenings and tendency to buckle, iron doors when really well constructed, well hung and with fastenings at several points, and if constructed with an air space intervening, are of considerable efficiency. We are illustrating one of the double doors to which our attention has been called where in a serious fire the fire doors kept well in position, and it is well to observe the manner in which they are hung and fastened.

FIRE AT DERHAM BROTHERS' BOOT FACTORY, BRISTOL.

PLAN OF RECENT BRISTOL FIRE AT DERHAM BROTHERS' BOOT FACTORY.

AUTOMATIC SPRINKLERS.

The Fire Offices Rules.

IN continuation of our series of Fire Office Rules we are now publishing the first part of the sprinkler rules which are issued by the Fire Offices' Committee; and we have taken the rules dated March, 1905, which is the eleventh edition, i.e., the eleventh variation of the rules in question, we believe.

The automatic sprinkler is now being installed in innumerable fire-risks, and not limited, as in its early days, merely to factories and mills. It is a matter of importance to all architects to be thoroughly conversant with the requirements of the Fire Offices in respect to these rules.

The economical advantage of the introduction of sprinklers is the very material rebate accorded by the fire-insurance companies for sprinkler risks, but if the architect is going to apply a sprinkler installation it is well that we should know exactly what is required in the early stages, for even in certain directions his design will be governed by some of the sprinkler requirements: thus, for instance, the all-important requirement of the height of the tank above the topmost sprinkler, a dimension which frequently necessitates the erection of a tower or turret for containing the tank in question.

As to the actual sprinkler to be used, quite a dozen sprinklers meet the requirements of the insurance offices, so that there is quite a considerable field to choose from. Of these certain sprinklers are considered to be worked by a ring or tariff of sprinkler manufacturers, whilst the others are made by new-comers outside the ring who are competing in prices.

As to the relative efficiency of the different sprinklers, it would lead too far to enter into detail here, but, speaking generally, of course, any sprinkler passed by the Fire Offices will obtain for the client the rebate that he requires, and there are at present no independent public reports as to the relative efficiency and usefulness of different sprinklers on the market in this country.

In one point there has been a notable result of investigation by the British Fire Prevention Committee, and that is that the temperatures stamped upon the sprinklers as indicating the temperature at which they will act are not necessarily reliable, and that such marked temperatures apparently relate to a hot-water test, which is a very different matter from the actual test in practice where the question of the conductivity of the pipes and the atmospheric conditions have to be taken into consideration. The architect will be quite safe in assuming that in actual practice a higher temperature is required to set the sprinkler going than that marked on some of the makes.

The rules for automatic sprinkler installations are as follows:—

FIRE OFFICES' COMMITTEE'S RULES.

As regards tanneries these rules do not apply to risks in Bermondsey and elsewhere on the south side of the River Thames within a radius of three miles of the Leather Market, Bermondsey.

Buildings to be Protected.

1. All the non-fireproof portions of any building fitted with automatic sprinklers (except silos or grain bins in corn mills) must be protected by sprinklers in manner hereinafter described, and, except as hereinafter provided, all the non-fireproof portions of every building communicating therewith otherwise than by double fireproof doors, or adjoining and not having a party-wall carried up to and through the roof, must also be so protected.

Corn Mills.—Silos or grain bins inside buildings which are otherwise efficiently protected by sprinklers in accordance with these rules need not themselves be protected by sprinklers.

2.—(a) When a sprinklered building communicates by any opening not protected by a fireproof door with an adjoining shed having a fireproof floor, in which non-hazardous processes, i.e., any process after spinning but not including drying by artificial heat, only are carried on, it is not required that such shed should be protected by sprinklers in all its parts provided that every such opening be adequately protected by a sprinkler or sprinklers placed in the shed in close proximity to it.

N.B.—For the purpose of this rule the term "drying by artificial heat" is not to include the drying of yarn or cloth on steam-heated cylinders and/or ballooning.

(b) Corn Mills, Flax Warehouses (Scotland and Ireland).—In these risks this rule does not apply.

(c) Tanneries.—In these risks the shed does not require to have a fireproof floor, but it must be occupied solely as tan or lime pits, and/or for unhairing, fleshing or other wet process.

(d) Shipbuilders (England and Wales) and Metalworkers (Northern Counties, England, and Metalworkers and Woodworkers (Scotland).—In these risks the shed must be without galleries or lofts; it must be built of brick or stone and slated or tiled or glazed, or constructed of iron, on iron or wooden framework without wooden linings, and in any case having an incombustible floor or a wooden floor resting on an incombustible surface without cavities, and used only for metal-working or for the storage of incombustible material. Wooden louvres in the roof are not to be deemed timber construction.

Sprinkler Heads.

3. Sprinkler heads, which must be of a pattern approved by the fire-insurance companies, must be suitably arranged in distributing pipes supplied with water, as hereinafter provided. An adequate supply of spare sprinkler heads should always be kept on hand.

Spacing of Sprinklers.

4.—(a) Sprinkler heads must not be more than 10 ft. apart, nor more than 5 ft. from walls or the face of heavy ceiling beams, except as otherwise specially provided in the following table:—

In case of	Width of bays in feet from centre to centre of beam.	Number of rows required in each bay.	Maximum distance of heads.				Minimum number of heads required to floor area.
			Across the bays.	Down the bays.	From face of heavy beams or walls parallel with bays.	From walls at end of bays.	
Roofs or ceilings in bays underdrawn with plaster, wood or metal, or constructed of planks without joists.	Not over 10	1	10	11	5	6	1 to each 100 sq. ft. of bay, measuring from centre to centre of beam.
Do. do. -	Over 10, not over 11	1	11	10	6	6	do.
Roofs or ceilings in bays, but being open joisted or having common rafters of roof exposed.	Not over 10	1	10	10	5	5	do.
Do. do. -	Over 10, not over 11	1	11	8	5½	4	do.
Do. do. -	Over 11, not over 22	2	11	10	5½	5	do.
Fireproof roofs or ceilings	Not over 11	1	11	11	6	6	do.
Do. do. -	Over 11, not over 11½	1	11½	11½	5½	5	do.
Do. do. -	Over 11½, not over 23	2	11½	11½	5½	5	do.
Corn mills, except warehouses not communicating with mill otherwise than by double fireproof doors.	Not over 8½	1	8½	8	4½	4	1 to each 64 sq. ft. of total area.
Do. do. -	Over 8½, not over 9	1 and 2 alternately	8	8	4½	4	do.
Do. do. -	Over 9, not over 16	2	8	8	4	4	do.

NOTE.—When carrying out the requirements of this rule the bays in a roof are understood to be formed by the spaces between the principal rafters.

(b) Flax Warehouses (Scotland and Ireland).—In the case of these risks there must be a clear space of 18 ins. kept below roofs and ceilings. All racks and/or stock must therefore be kept this distance below. Where the ceiling is open-joisted the measurement to be taken from the bottom of the joists. In rooms where the external walls are of wood the sprinklers must not be a greater distance than 4 ft. from such walls.

(c) Shipbuilders (England and Wales) and Metalworkers (Northern Counties, England, and Metalworkers and Woodworkers (Scotland).—In rooms where the external walls are of wood, whether louvered or not, or of iron, wood-lined, the sprinklers must not be a greater distance than 4 ft. from such walls.

(d) Tanneries.—In rooms where the external walls are of wood, whether louvered or not, the sprinklers must not be a greater distance than 4 ft. from such walls.

N.B.—It is recommended that, where practicable, the level of the hides or skins hung in the hanging and/or drying-room be not within 12 ins. of the sprinkler heads.

Protection of Concealed Spaces.

5. The spaces between the ceilings and roofs, either at the apex or at the sides of buildings, must be efficiently protected. The maximum number of sprinklers need not exceed the number in the room below.

Hoists, Gearing Boxes, &c.

6.—(a) All hoists, elevators, shoots, rope or strap races, non-fireproof w.c.'s, gearing boxes and non-fireproof staircases (including the undersides) inside buildings must be protected by sprinklers.

(b) Corn Mills.—There must be at least one sprinkler head (1) in the box of every elevator so placed as to command the head and both the legs or shafts of the elevator; (2) at the head of every dust trunk or spout, and (3) inside the dust trunk or spout connected with every exhaust fan, either independent or forming part of any machine other than a middlings purifier collecting its own dust, the sprinkler in every instance to be fixed on the delivery side of the fan and close to it.

(c) Corn Mills.—All oblique dust trunks at an angle of less than 70 per cent. and all horizontal dust trunks must also be protected with sprinklers fixed inside the trunks at intervals of not more than 10 ft. from each other.

(d) Corn Mills.—When the centrifugals and similar machines are placed one above another in tiers, as in the

diagram below, and are less than 3 ft. from each other, sprinklers must be placed in the spaces as shown:—

(e) Tanneries.—All dust trunks must be protected by placing a sprinkler inside the trunk on each side of and close to the fan.

(f) Shipbuilders (England and Wales) and Metalworkers (Northern Counties, England, and Metalworkers and Woodworkers (Scotland).—All exhaust fans for collecting refuse must be protected by placing a sprinkler inside the trunk on each side of and close to the fan.

Water-supplies.

7.—(a) Every ordinary sprinkler installation must be provided with two separate and adequate sources of water-supply always available; one of such sources of supply must be practically unlimited.

(b) The following are accepted sources of supply:—
 (1) Town's mains.
 (2) Elevated tank or private reservoir.
 (3) Pressure tank.
 (4) Pumps.
 (5) Injector apparatus of approved pattern in connection with public hydraulic mains.

N.B.—An injector apparatus can in no case be regarded

as one of the "accepted sources of supply" unless and until full particulars of the installation have been submitted and specially approved by the fire-insurance companies.

(c) In special cases where only one water-supply is provided the installation will be specially considered by the fire-insurance companies, but the source of supply must be one of the following, viz.:—

(1) Town's mains;
 (2) Elevated private reservoir having a minimum capacity of 50,000 gallons;
 (3) Automatic pump; or
 (4) Injector apparatus of approved pattern in connection with public hydraulic mains.

N.B.—When the source for a one water-supply installation is town's mains there must be, in addition to the requirement of rule 8 (a) a pressure at the level of the highest sprinkler of at least 15 lbs. to the square inch when in the case of 1 in. installations, a 1 in. drip valve is fully open and, in the case of installations over 1 in., a 2 in. drip valve is fully open.

(d) The minimum size of the feed pipe from each source of supply must be in accordance with rule 16.

(e) The use of sea water is not allowed.
 N.B.—Water-supplies which have fibrous or other objectionable matter in suspension should not be used, as such matter is liable to cause accumulations in the pipes.

Town's Water.

8.—(a) Town's water can only be accepted if it gives, during both day and night, a pressure at the level of the highest sprinkler of at least 15 lbs. to the square inch.

(b) The water must be brought into the building direct from the street main by a supply pipe leading to the main stop valve and used only for fire services, except that one pipe not larger than 1½ in. in internal diameter or its equivalent sectional area in smaller pipes, may be taken off such supply pipe for ordinary service.

N.B.—To calculate the sectional area of a pipe multiply the square of its internal diameter by .7854.

(c) If the town's main be of insufficient size, according to the table appended to rule 16, it cannot be accepted as a source of supply, but connections from two mains which in the aggregate are the equivalent in sectional area to the pipe required will be accepted as one supply, provided the original supply to these mains is of adequate capacity.

(d) Connections to two separate public mains, supplied

from independent sources, will be accepted as a duplicate service.

Elevated Tanks and Reservoirs.

9.—(a) Elevated tanks or private reservoirs must have their capacity at least 15 ft. above the highest sprinkler, and must have the following capacity:—

When the sprinklers on any one floor or on the corresponding floors of buildings communicating otherwise than by fireproof doors or shutters do not exceed 150, 5,000 gallons; do not exceed 200, 6,500 gallons; exceed 200, 7,500 gallons.

N.B.—Private reservoirs which do not comply with these requirements will be specially considered by the fire-insurance companies.

(b) The tank must always be kept full of water, except where its capacity is in excess of the sprinkler requirements, in which case the excess may be drawn off for other purposes, provided that the outlet for that purpose be placed at such a height above the bottom of the tank that the quantity of water in the tank can in no case be so reduced through such outlet as to leave less than the specified quantity required for the sprinklers.

(c) The tank must be fitted with an indicator showing the depth of the water therein, and should be cleaned at least once in every half year.

(d) The tank must be covered in, and provision must be made to prevent the water in it from freezing.

Pressure Tanks.

10.—(a) Pressure tanks must be fixed inside a protected building and as high as possible, preferably in the top room.

(b) The capacity of the pressure tank to be not less than 5,000 gallons, of which two-thirds (say 3,333 gallons) must be water, and such an air-pressure must be pumped up and maintained as will give not less than 75 lbs. initial pressure on the highest sprinkler when the tank is on a level with it, but when the tank is on a lower level a further air-pressure of 1½ lbs. to the square inch must be maintained for every foot or part of such between the tank and the said highest sprinkler.

(c) As an alternative arrangement, and in order to reduce the air-pressure to be maintained, it is permissible to erect a tank or tanks containing in all at least 3,333 gallons of water, one-half of the contents of each tank being air and the other half water, and in such cases the initial pressure to be pumped up and maintained in the tank or tanks will be 45 lbs. to the square inch when the tank is on a level with the highest sprinkler, but when the tank is on a lower level a further air-pressure of 1 lb. to the square inch must be maintained for every foot or part of such between the tank and the said highest sprinkler.

(d) The tank must be fitted with an air-pressure gauge, as well as with gauge glasses to show the level of the water, and the stop taps on the latter should be kept shut. There must also be a stop valve and a back pressure valve on the pipe feeding the tank with water, also on the pipe through which air is pumped into the tank, and these valves should be fixed close to the tank.

Pumps.

11.—(a) Pumps must be fixed in an easily accessible position where they are not liable to be damaged by fire or other causes.

(b) Pumps must be quadruple acting and must have a capacity—

	Gals. per min.	Diam. of plungers.
do not exceed 100	250	6 ins.
do. 200	500	7 ins.
exceed 200	625	8 ins.

N.B.—The capacity of a pump must be calculated on a plunger speed not exceeding 150 ft. a minute for each plunger.

(c) Pumps must take water from a practically unlimited source.

(d) Pumps may be either automatic or non-automatic, except where the town's water or a hydraulic injector apparatus is one of the supplies, when they must be automatic and constantly moving under steam.

(e) A warranty must be inserted in policies that power sufficient to drive the pumps at an efficient pressure will be available at all times throughout the year.

Hydraulic Injector Apparatus.

12.—(a) The hydraulic injector apparatus must be fixed in an easily accessible position where it is not liable to be damaged by fire or other causes.

N.B.—See also the N.B. appended to rule 7 (b).

(b) The capacity of the apparatus must be the same as provided for pumps in rule 11 (b).

(c) The water in the hydraulic main must have a constant pressure of not less than 600 lbs. to the square inch.

(d) A pressure gauge must be fixed on the hydraulic connection.

(e) The hydraulic accumulator connected with the injector apparatus must be fitted with a small outlet so that it will be under constant slow motion, and there must be an indicator to show the number of strokes made.

(f) A constant supply of water, either from the town's main, or from some other practically unlimited source, must be provided, and if obtained by a direct connection with the town's main the sizes of the main and connection must be in accordance with the table appended to rule 16.

(g) If a direct connection with a town's main is not allowed, a suction tank having an automatic supply must be provided of not less than the following capacity:—

Apparatus	250 gallons per minute, 2,000 gallons.
delivering 500 "	3,000 "
delivering 625 "	4,000 "

The feed pipe to the suction tank must be in accordance with the table appended to rule 16, and must be supplied from a practically unlimited source. The necessary ball valve must be full way and equal to the size of the supply pipe.

If one of the water-supplies is the town's main the suction tank in connection with the hydraulic injector apparatus must be of the capacity as required by rule 9 for elevated tanks and reservoirs.

Dry Pipe System.

13. In buildings not artificially heated, in which there is any chance of the pipes freezing, the sprinkler installation must be erected upon an approved dry pipe system. When the dry pipe system is used it must be so arranged that not more than 700 sprinklers be controlled by one main stop and air valve.

Pressure Gauges.

14.—(a) To all installations there must be a pressure gauge fixed above the alarm valve, and another below the alarm and main stop valves, and in the case of installations which have the town's water as one of the supplies there must be a third gauge fixed on the branch from the main, and on the outside of the back-pressure valve in such branch so as to register the pressure in the main at all times.

(b) Also when a pump or hydraulic injector apparatus forms one of the supplies to an installation there must be a pressure gauge fixed on the delivery pipe from the pump or apparatus, and on the pump or apparatus side of the back pressure valve on such pipe.

Valves and Supply Connections.

15.—(a) A main stop valve must be provided which, when closed, will shut off all supply of water to the installation. All the water-supplies must be connected before passing through the main stop valve, with the exception that in installations not on the dry pipe system where one of the sources of supply is worked by a non-automatic pump, such pump may be connected with the installation at such point as may render it most readily available. Each supply pipe must be fitted with a back-pressure valve. The main stop valve must be placed at or near the ground level, and must be properly protected from the action of frost and from being tampered with, but readily accessible to authorized persons. It must be secured open by a riveted or padlocked strap.

N.B.—In installations having one water-supply back pressure valves are unnecessary.

(b) Subsidiary stop valves are not allowed on any supply pipes except on the supply pipes from town's mains, private reservoirs, non-automatic pumps and pressure tanks. The valve in the case of pressure tanks to be secured open by a padlocked chain.

(c) In special cases small shut-off cocks may be allowed on the supply pipes to sprinkler heads fixed inside wheel-boxes and gearing towers, or to sprinklers in exposed water-wheel places, cartways, loading places, outside hoists or gangways and outside closets where there is a risk of freezing. The cocks to be of the plug type with fixed handles.

Sizes of Pipes.

16. From the main stop valve a main pipe must be fixed to supply the distributing pipes in each room of the building. The minimum size of the main pipe must be determined by the greatest number of sprinklers in any one floor or corresponding floors of communicating buildings, according to the tables below. The size of each of the distributing pipes must be determined, according to the same tables, by the number of sprinklers which it is intended to serve:—

Sprinklers allowed.

Size of Pipe.	TABLE A. Applicable to all cases except as specified in Table B.	TABLE B. Applicable to drying stoves and drying rooms where the maximum temperature exceeds 100 degs. Fahr.
	Ins.	
1	1	1
1½	3	2
2	5	4
2½	9	6
3	18	12
3½	28	16
4	46	28
4½	78	
5	115	No pipe to exceed 3 ins. If more than 28 sprinklers are required, more than one feed pipe must be provided.
6	125	
	150	
	over 150	

N.B.—For the purpose of this rule buildings are considered to be communicating with each other unless the openings between them are protected by fireproof doors or shutters.

N.B.—Tanneries.—Where the floors are wholly or partially open-boarded or sparred, the sprinklers in the two or more floors so communicating which, together with corresponding floors of communicating buildings, have the largest number of heads must be taken cumulatively when carrying out the requirements of this rule and also rules 7, 8, 9, 11 and 12.

N.B.—Shipbuilders (England and Wales) and Metalworkers (Northern Counties, England), and Metalworkers and Woodworkers (Scotland).—Where the floors are wholly or partially open-boarded or sparred, or constructed of perforated or other open ironwork, the sprinklers in the two or more floors so communicating which, together with corresponding floors of communicating buildings, have the largest number of heads must be taken cumulatively when carrying out the requirements of this rule and also rules 7, 8, 9, 11 and 12.

The sprinklers under all galleries or stages must be taken cumulatively with the remainder of the building.

When individual sprinklers in concealed roof spaces, either in the ridge or at the sides thereof, are fed by ½ in. pipes from the room below, the sprinklers in such concealed spaces and in the room below must be taken cumulatively up to the number allowed off a ½ in. pipe.

Use of Pipes.

17. None of the pipes mentioned in rule 16 must be used for any other purpose than to feed the sprinkler installation or to test the alarm signal. The diameter of the testing cock should be ½ in.

Arrangement of Distributing Pipes and Sprinklers.

18.—(a) The distributing pipes for all installations must be so arranged that not more than twelve sprinklers shall be fed in one row, as shown in the diagrams below, and in any case not more than six sprinklers must be fixed on either side of the upright pipe directly feeding the row when the arrangement of pipes is in accordance with diagram 1, or on either side of the main distributing pipe when the arrangement of pipes is in accordance with diagram 2.

A, distributing pipe. B, Upright pipe. C, Main distributing pipe.

(b) It is to be understood that the sprinklers are not necessarily to be fixed pendent, but may be placed upright, and therefore above the distributing pipe, when required.

(c) In dry-pipe installations, however, it is imperative that all sprinklers be placed upright and above the pipe line.

N.B.—In the case of very large premises comprising distinct buildings it may be considered necessary that the sprinkler equipment be divided into two or more installations, although one set of water-supplies will suffice for all. It is strongly recommended that this sub-division be adopted whenever practicable.

Alarm.

19. Every installation must be fitted with an approved automatic alarm signal to give notice as soon as any sprinkler is opened. This must be properly protected and tested at frequent intervals.

Regulations as to Devices for Testing Dry-pipe Installations.

20. There must be a ½ in. pipe testing tap on the installation side of the air-valve; and where an ordinary alarm valve is fixed in addition to the air-valve, a ½ in. testing cock may be fixed between the two valves for the purpose of frequently testing the gong as required by rule 19. When the installation is under water the alarm must be tested by opening the ½ in. test cock above the air-valve.

Examination of Sprinklers.

21. Corn Mills.—Every sprinkler must be examined at least once a week and all dough and other accumulation removed therefrom.

Ordinary Appliances.

22. Automatic sprinklers are intended to be in addition to, not in substitution for, other fire-extinguishing appliances, which must also be provided in accordance with the requirements of the fire-insurance companies and maintained in thorough working order.

N.B.—For notice to be given to the fire-insurance companies before turning off the water in case of repairs, &c., see No. 1 of "Precautions" below.

Precautions to be taken

When an installation or its water supplies, or the tank only when the installation has for its sole water-supply a tank and non-automatic pump, are rendered inoperative from any cause.

1. Notice must be given to the fire-insurance companies having policies on the risk at least three days before the date of turning off the water, and written permission obtained from them for the purpose.

2. Alterations and/or additions to the installation or its water-supplies must be proceeded with with all possible speed, so that the sprinklers may remain inoperative as short a time as possible.

3. In manufacturing premises the installation must not in any case be rendered inoperative except during daylight. When the alterations or repairs are extensive, and whenever it is necessary to "break" a pipe exceeding 1½ ins. in internal diameter, or to take out a main stop valve, alarm or back-pressure valve from its position, all machinery must be stopped until the installation is again operative. The water must not be turned off at the main stop valve until one hour has elapsed from the time of the stoppage of the machinery, and then only after a thorough examination of every part of the premises has been made and no indication of fire perceived.

4. Before turning the water off, all the ordinary fire-extinguishing appliances must be brought out and put in readiness: the stand pipes must be laid down to the hydrants, and the hose nozzle and coupled up to the stand pipes and/or to the plugs or pump as the case may be, and a sufficient number of men qualified to make efficient use of the appliances, and under the control of a foreman, must be kept at their several posts, so that should occasion arise—the best possible service may be rendered. The number of men required will be in the proportion of 1 to every 150 or fraction of 150 sprinklers fitted up. In no case, however, must there be less than four men.

5. The water must be turned on again as soon as the alterations or repairs are completed, and always, if possible, before dark.

6. Smoking is to be strictly prohibited, and no intoxicants allowed on the premises during the progress of the work.

7. In the event of an installation becoming inoperative through accident the above precautions, so far as the same are applicable, must be observed with the least possible delay.

8. An adequate supply of spare sprinkler-heads should always be kept on hand.

FIRE-RESISTING CONSTRUCTION.*

By Alfred E. Corbett, A.R.I.B.A.

(Concluded from p. 23, No. 579.)

WE now turn to some British floors and to some results of the British Fire Prevention Committee's tests.†

No. 34 Red Book deals with the very usual type of floor in which the concrete is flush with the top and bottom flanges of the supporting steel joists, these flanges being unprotected. The bottom flange quickly gets red hot and expands, and as the top part remains cool a considerable deflection is bound to take place. In this case, during a moderate test of 1½ hours, the floor deflected 10½ ins. in a span of 10 ft., and then half of it collapsed. This was entirely owing to the unprotected soffits of the joists, the concrete standing the fire well, and clearly demonstrates the danger of this very common form of flooring.

No. 61 describes a gin. floor of 5 to 1 coke-breeze concrete in which the steel joists are protected underneath by zins. of concrete.

The test was severe—a fire rising to a temperature of 2,230 degs. Fahr. and lasting for 2½ hours—but no deflection occurred, and the concrete was quite sound except for a disintegration of ¾ in. where the water jet struck it, and for small cracks.

This test proves that a good coke-breeze concrete floor erected by the general contractor can be made thoroughly fire-resisting by the simple precaution of putting zins. thickness of concrete below the steel joists; and for it to be worth while to pay a greater price for some patent floor it is necessary to have some other advantage than mere fire-resisting properties, such, for instance, as less transmission of sound, less weight or thickness, less steelwork, &c.

A Porous Tile Floor.

Of the few patented floors that have been tested by the British Fire Preventive Committee the most severe test was resisted successfully by a hollow tile floor by the National Fireproofing Co. (of Pittsburg and London) described in Red Book No. 96.

* A paper read before the Manchester Society of Architects on February 8th, 1906.
† [The author's opinions must not be taken to represent our own.—Ed. B.J.]

In general principle this floor is curiously like the Baltimore floors which failed so disastrously; with the addition of a steel wire reinforcement on the principle of reinforced concrete construction, and with the vital difference that the material was semi-porous instead of hard-burnt terra-cotta. A complete temporary wooden centering is required for this floor.

The test lasted four hours, with a heat up to 1,880 degs. Fahr., and the blocks were intact at the end of the test. The maximum deflection during test, with a load of 2½ cwt. per sq. ft., was only ¾ in. in a span of 10 ft., and there was not permanent deflection.

The soffit was plastered with "Sirapite" plastering 1 in. thick, and this seems to have stood the test extremely well, although some small patches flaked off in fifty minutes, but at the end of the test it was washed off where struck by the water.

Possible Weakness.

Though it may seem hypercritical to suggest a defect after such a satisfactory test, I would draw attention to one possibility of weakness in this floor which may be found to a greater extent in nearly all floors.

The opinion of many experts is that for complete protection all steelwork should be enclosed by at least zins. of concrete or of porous terra-cotta. In this floor the joist was protected by 1½ ins. of terra-cotta and 1 in. of plaster, which proved sufficient for this test. We have seen that when the fire hose was turned on to the ceiling it washed the plaster off. Now in an actual fire it would be quite likely that a jet might be turned on the ceiling for a few minutes in the early stages of a fire, and the firemen then be driven back and the fire go on burning fiercely. The few minutes of wetting would have brought down the greater part of the plaster, and there would then be only 1½ ins. of terra-cotta between the flames and the steel instead of the zins. recommended. This might be just sufficient, but in many floors there would only be ¾ in. or ¾ in. of protection left when the plaster had been knocked off, and it is very probable that in such cases the joists would get very hot, causing serious deflection.

The Columbian Floor.

Red Book No. 23 describes a very satis-

factory test of the Columbian Fireproofing Co.'s floor, a patent floor somewhat resembling an ordinary joist and concrete floor. The soffits of joists are specially protected by zin. slabs of concrete cast separately, strengthened by wires, and fixed by metal anchors which are eventually completely embedded in concrete.

The test lasted for 2½ hours, rising to a temperature of 2,300 Fahr., but without having any effect on the floor beyond the falling of a few flakes of plaster. When the water jet was applied at the conclusion of test about one-third of the area of the ceiling fell.

My point as to danger when plaster is knocked off does not apply to the girders in this case, but it does apply to the small joists or bars, which would only have 1 in. of concrete under them if the plaster were removed.

Comparing this floor with No. 61, the ordinary coke-breeze and steel-joist floor, there is little to choose between them as regards fire-resisting qualities. The Columbian is thinner, and therefore lighter, but this may possibly imply more easy transmission of sound.

Saving of Centering.

These floors, and many others, require a temporary wooden centering. There is a large class of patent floors which avoid this drawback by providing a permanent centering, generally in the form of terra-cotta or fireclay lintels.

Unfortunately none of these has been tested by the British Fire Prevention Committee. It would be a good thing if architects would show patentees that they attach importance to these tests, as without independent tests it is impossible for them to appraise the real value of the claim of each inventor that his floor is the best.*

A ventilated floor that has been tested by the British Fire Prevention Committee (Red Book No. 64) is that of the Banks' Fireproof Construction Syndicate. The floor was of breeze-concrete and steel joists, with the joist soffits uncovered; but under the floor

* [Here the author gave particulars and criticisms of several other floors on the market which have not been officially tested, and we think it best to omit reference to these.—Ed. B.J.]

The Author's Summary of Partition Tests by the British Fire Prevention Committee.

The order given by the author was intended to indicate the order of merit of the results, based on the length of test and its severity, and on the amount of damage done. Neither THE BUILDERS' JOURNAL nor the British Fire Prevention Committee were responsible for this classification, which was only approximate, and we have had to make some omissions where it was erroneous.—Ed. B.J.

	Number of Red Book.	Partition tested by B.F.P.C.	Duration of test unbroken.	Maximum temperature on fire side.	Maximum temperature outside.	Weight in lbs. per sq. yd.	Finished thickness.	Comment.
			Hours.	Degs. Fahr.	Degs. Fahr.	Lbs. 378	Inches. —	
FULL PROTECTION.	84	Jabez Thompson's "Terrawode" brick-wood, not plastered, set in mortar of equal parts sand, fireclay and plaster-of-Paris.	4	2,130	230	215	4 $\frac{3}{8}$	Approximate weight of 4 $\frac{3}{8}$ in. common brickwork, unplastered; given for comparison only.
	99	Porous terra-cotta hollow tile by the National Freproofing Co., $\frac{3}{8}$ in. asbestic and lime plaster.	2 $\frac{1}{2}$	1,980	—	? 130	2 $\frac{1}{2}$	Buckled to a maximum in the centre of 2 $\frac{1}{2}$ ins. Five bricks flaked up to 1 $\frac{1}{2}$ ins. deep.
PARTIAL PROTECTION.	88	"Kulm" slabs, H. W. Cullum & Co. $\frac{3}{8}$ in. plaster on fire side.	2	2,010	210	150	3 $\frac{1}{2}$	Bulged 2 $\frac{1}{2}$ ins. Face of one tile split off.
TEMPORARY PROTECTION.	52	"Mack" slab. J. A. King & Co. 1in. plaster inside, $\frac{1}{2}$ in. outside.	1 $\frac{1}{2}$	2,050	125	—	3 $\frac{5}{8}$	No buckling.
	63	Banks' Fireproof Construction Syndicate, Ltd., helical lathing fixed to x standards 2ft. apart, 2 $\frac{1}{2}$ in. coarse stuff with 50 per cent. Portland cement.	1 $\frac{1}{2}$	2,100	128	—	2 $\frac{3}{4}$	Lathing and studs partly exposed.
	44	Mural and Decorations Co.'s partition terra-cotta lathing, plastered both sides.	1 $\frac{1}{4}$	2,130	Did not light a match.	—	2 $\frac{1}{2}$	
	83	Jabez Thompson's thin white partition slabs, not plastered.	1 $\frac{1}{4}$	1,800	100	150	21 $\frac{3}{16}$	
	74	Phoenix slabs. Van der Vijgh Brothers. $\frac{1}{2}$ in. plaster inside, $\frac{1}{2}$ in. outside.	1 $\frac{1}{4}$	1,940	125	—	3 $\frac{1}{2}$	
	22	Brick-nogged studded partition, brick-on-edge, 3in. by 2in. studs, plastered both sides.	1	2,000	—	215	4 $\frac{1}{2}$	Studs charred. Outside almost intact.
	37	Gypsine Brick Co.'s partition. Thin coat of fireclay on fire side.	1	1,950	Did not light a match.	—	3 $\frac{1}{2}$	
	57	"Non-flammable" deal matchboarding, 1in. boarding on 3in. by 2in. studs.	$\frac{3}{4}$	1,545	100	—	4	Inner boarding partly burning.

special metal ceiling bars supported helical metal lathing, which was plastered with coarse stuff and Portland cement $1\frac{1}{2}$ ins. thick. A ventilated space was left between floor and ceiling. The floor satisfactorily resisted a test of three hours, but the fact that it deflected $2\frac{1}{2}$ ins. in a span of 22 ft. suggests that the joist soffits need more protection than a mere ceiling, as the lower flanges evidently got hot. A concrete protection could easily be added without materially altering the design. This result is not quite as good as the Columbian floor test, on account of the deflection, but the Banks floor gains in its soundproof quality through its separation of floor and ceiling.

A test (No. 14) of a ventilated floor by the New Expanded Metal Co., in which naked joists under a concrete floor were only protected by a suspended ceiling, showed similar results to the Banks' floor test, a deflection of $1\frac{1}{2}$ ins. in a $1\frac{1}{2}$ hours' test proving the protection to be insufficient.*

Reinforced Concrete.

I must now refer to floors of reinforced concrete, a comparatively new material which is certain to be widely used in the future; one which presents great possibilities with regard to fire-resistance as well as in other ways. It is impossible in the short time available to discuss the principles of this construction, but I may remind you that it is a combination of steel and concrete arranged to utilize to the greatest advantage the tensile strength of the steel and the compressive strength of the concrete.

Reinforced concrete materially differs in its properties from either steel or concrete, and is virtually a new material. To-night we can only consider its value as a fire-resistant. I may say at once that I fully believe it to be one of the most valuable materials available for this purpose, provided that the ordinary principles of steel protection are observed. There is, however, a great tendency, owing to commercial competition, to cut down the protection to a dangerous degree.

Floor slabs or beams of this material consist of a slab of concrete with a small proportion of steel embedded in it, in the form of some kind of rods or network. In order to get the greatest strength these rods must be as near as possible to the bottom of the concrete, and in most systems we find that there is only from $\frac{1}{2}$ in. to 1 in. of concrete below the steel rods. This is perfectly correct when only strength is required, but for fire-resistance we must remember the principle that 2 ins. should be the minimum thickness of protection, and we should add sufficient concrete to ensure at least 2 ins. below every steel rod.

This is stipulated in the Metropolitan Building Act, which has just come into force. The Fire Offices Committee's rules for reinforced concrete construction stipulate that each steel rod shall be protected by at least twice its own thickness of concrete, provided that the thickness is at least 1 in., and it need not exceed 2 ins. This would be quite efficient for thick rods, as 1 in. rods would have 2 ins. of protection, but it seems illogical to allow $\frac{1}{2}$ in. rods to have only 1 in. of protection, as they might be just as vital to the strength of the floor.

This point has not yet been adequately tested by the British Fire Prevention Committee, and great caution is necessary in regard to reports published by the various patentees describing successful tests of their manufactures.†

I give a table (see previous page) sum-

* [This Company's test was superseded by them on February 27th by a four hours' test on a floor measuring 22 ft. by 10 ft., under the usual British Fire Prevention Committee's conditions, with less than 1 in. deflection.—Ed. B.J.]

† [Since this paper was written two floors on the Coignet system, two designed by Messrs. Skelton, and one by the New Expanded Metal Co. were under test, but are not yet reported upon.—Ed. B.J.]

marizing the British Fire Prevention Committee's tests of partitions, and in this I have attempted to classify the results in order of merit, and giving reference to the number of the Red Book describing such test. This classification is only my personal opinion, based on these tests, and I may mention that in every case the British Fire Prevention Committee's reports only state facts, not opinions.

I had hoped to consider columns, doors, sprinklers and various other branches of this very wide subject, but time fails me. Full information on the entire subject can be obtained from the many publications of the British Fire Prevention Committee, which may be seen in Manchester at the King Street reference library or at the School of Technology library.

I will conclude with a quotation from a paper by Mr. Blashill, late architect to the L.C.C.: "The architect will get no help from public opinion nor from private persons. One never meets with anyone who will seriously contemplate the chance of fire in any private house or public building in which he or his may be present . . . Life would be too dismal if we were always contemplating possibilities against which the odds are a thousand to one. But when a catastrophe has occurred the public feels it must make atonement for its neglect and looks out for a scapegoat—the scapegoat is the architect. It is the architect who may reasonably be supposed to know most about the danger of fire and the means of fire-prevention. It is to him, and not to his client, that the public will look in case of accident through neglect of precautions. It is to him, indeed, that the client himself will look if there is loss by fire, although he may have shut his eyes to risks and begrudged the cost of the structure as it stood. The architect must face the whole responsibility."

UNIFORM BY-LAWS.

Recommendations of the National Board of Fire Underwriters for the Construction of Fireproof Buildings.

EVERY building erected or altered to be used as a theatre, lodging-house, school, jail, public station, hospital, asylum, institution for the use, care or treatment of persons, the height of which exceeds three storeys and not more than 40 ft. in height, and every building erected or altered to be used as a hotel or an apartment house which exceeds four storeys and not more than 50 ft. in height, and every other building the height of which exceeds 55 ft. or more than four storeys in height, shall be built fireproof. Such is the recommendation of the National Board of Underwriters to all cities and towns to secure greater safety of life and property from the destructive effects of fire. The adoption of this recommendation would mean more uniform building laws throughout the country, which, if consistently enforced, would put an end to holocausts and conflagrations. How this result is to be accomplished is set forth as follows in sections 106 to 110 of the building code proposed by the National Board of Fire Underwriters for universal adoption:—

Fireproof Buildings.

They shall be constructed with walls of brick, stone, Portland-cement concrete, iron or steel in which wood beams or lintels shall not be placed, and in which the floors and roofs shall be constructed with rolled wrought-iron or steel floor-beams, spaced not more than 5 ft. on centres, for stores, warehouses and factory buildings, and for all other buildings not more than 8 ft. on centres, and otherwise so arranged as to spacing and length of beams that the load to be supported by them, together with the weights of the materials used in the construction of the said floors,

shall not cause a greater deflection of the said beams than $\frac{1}{80}$ th of an inch per foot of span under the total load. The beams shall be tied together at intervals of not more than eight times the depth of the beam with suitable tie-rods.

Between the floor and roof beams shall be placed brick arches springing from the lower flanges of the steel beams, or the spaces between the beams may be filled with hollow tile arches of hard-burnt clay of porous terracotta, or arches of Portland-cement concrete, plain or reinforced with metal, or such other fireproof composition may be used, provided that in each and all cases the strength and method of construction shall conform to the requirements of this code.

The stairs and staircase landings shall be constructed of brick, stone, Portland-cement concrete, iron or steel, or a combination of these materials.

No woodwork or other inflammable material shall be used in any of the partitions, furrings or ceilings in any such fireproof buildings, excepting, however, that when the height of the building does not exceed eight storeys nor more than roof, the doors and windows and their frames and trims, the casings, the interior finish when filled solidly at the back with fireproof material, and the floor boards and sleepers directly thereunder, may be of wood, but the space between the sleepers shall be solidly filled with fireproof materials extending up to the underside of the floor boards.

When the height of a fireproof building exceeds eight storeys or more than roof, the floor surfaces shall be of stone, cement, tiling or similar incombustible material. All outside window frames and sash shall be of metal.

The inside window frames and sashes, doors, trim and other interior finish may be of metal or of wood covered with metal, or of such other incombustible material that may be approved by the Commissioner of Buildings.

Hall and Permanent Partitions.

All hall partitions or permanent partitions between rooms in fireproof buildings shall be built of fireproof material, and shall not be started on wood sills nor on wood floor boards, but be built upon the fireproof construction of the floor and extend to the fireproof beam filling above.

But this shall not preclude the use of wood block under each iron upright or stud in partitions constructed of iron uprights and lathed with iron, or filled in solidly between the iron studs or uprights with approved fireproof material, provided said wood block or cushion which is to allow for the possible lengthwise expansion of the uprights by heat does not exceed in thickness $\frac{1}{16}$ th of an inch to the foot of the height of said uprights.

The tops of all door and window openings in such partitions shall be at least 12 ins. below the ceiling line.

In all fireproof partitions other than when made of solid brickwork, the openings for doors and windows in same shall be framed on both sides with iron studs or uprights secured at top and bottom to the floor beams, and with like iron horizontals between the said uprights for the window openings and door-heads.

In all fireproof buildings, other than stores, warehouses and factories, if exceeding three storeys or 40 ft. in height, the stair halls shall be enclosed on each storey with fireproof material, same as required for elevators, to so form an enclosure the floor area of which shall not be more than three times the united area of the floor openings for the elevators and stairs.

Fireproof Floor Fillings between Beams.

Between the wrought-iron or steel floor-beams shall be placed brick arches springing from the lower flanges of the steel beams.

Said brick arches shall be designed with a rise to safely carry the imposed load, but never less than $1\frac{1}{4}$ ins. for each foot of span between the beams, and they shall have a thickness of not less than 4 ins. for spans of 6 ft. or less and 8 ins. for spans over 6 ft., or such additional thickness as may be required by the Commissioner of Buildings. Said brick arches shall be composed of good, hard brick or hollow brick of ordinary dimensions laid to a line on the centres, properly and solidly bonded, each longitudinal line of brick breaking joints with the adjoining lines in the same ring and with the ring under it when more than a 4 in. arch is used. The said arches shall spring from protecting skew-backs of burnt clay resting on and covering the lower flanges of the beams, so as to afford a minimum protection of 2 ins. of solid burnt clay material underneath the flanges, or otherwise entirely incasing the said flanges as provided for in this section. The brick shall be well wet and the joints filled in solid with cement-mortar. The arches shall be well grouted and properly keyed.

Hollow Tile Arches of Burnt Clay or Terra-cotta.

Or the space between the beams may be filled in with hollow tile arches of hard-burnt clay, semi-porous or porous terra-cotta of uniform density and hardness of burn. The shells and webs of hollow tile arch blocks shall not be less than 1 in. in thickness.

Skew-backs shall be used with all forms of hollow tile arches and be of such form and section to properly receive the thrust of the arches. The shells and webs of the skew-backs shall be not less than $1\frac{1}{4}$ ins. in thickness, except that the portion extending under the lower flanges of the beams shall be not less than 2 ins. of solid material not interrupted by any interior cavities or spaces. The said arches shall be of a depth and sectional area to carry the load to be imposed thereon without straining the material beyond its safe working load, but the thickness of the shells and webs shall in no case be less than herein required, and the depth shall not be less than $1\frac{1}{4}$ ins. for each foot of span, not including any portion of the depth of the tile projecting below the underside of the beams a variable distance being allowed of not over 6 ins. in the span between the beams if the soffits of the tile are horizontal; but if said arches are segmental, having a rise of not less than $1\frac{1}{4}$ ins. for each foot of span, the depth of the tile shall be not less than 6 ins. The joints shall be solidly filled with cement-mortar as required for common brick arches and the arch so constructed that the key parts shall always fall in the central portion. The shells and webs of all end construction blocks shall abut, one against another.

Arches of Portland-cement Concrete Plain or Reinforced with Metal.

Or the space between the beams may be filled with arches of Portland-cement concrete, segmental in form, and which shall have a rise of not less than $1\frac{1}{4}$ ins. for each foot of span between the beams. The concrete shall be not less than 4 ins. in thickness at the crown of the arch and shall be mixed in the proportions required by this code. These segmental arches, if reinforced, shall in all cases be reinforced or protected with steel rods or bars, reticulated or meshed steel, or similar metal weighing not less than 1 lb. per square foot and having openings not larger than 3 ins. square. Such reinforcing metal if essential to secure the required strength of the arches shall be so embedded that the metal is covered by not less than 1 in. of the concrete; but if used partly or wholly as a centering for, and if not essential to secure the required strength of the arches, the metal centering need not be wholly embedded in the concrete.

No concrete work shall be installed in freezing weather nor allowed to freeze after being put in place.

Various Fillings between Floor Beams.

Or between the said beams may be placed solid or hollow burnt clay, brick or concrete slabs in flat or curved shapes, concrete or other fireproof composition, and any of said materials may be used plain or in combination with wire cloth, expanded metal, wire strands, or wrought-iron or steel bars; said metal if used to be in all cases so embedded in the fireproof composition or combination that the metal shall be covered by not less than 1 in. of the fireproof material; but in any such construction, and as a precedent condition to the same being used, tests shall be made as herein provided by the manufacturer thereof under the direction and to the satisfaction of the Commissioner of Buildings, and evidence of the same shall be kept on file in the Department of Buildings showing the nature and result of the test. Such tests shall be made by constructing within enclosure walls a platform consisting of four rolled steel beams 10 ins. deep, weighing each 25 lbs. per lineal foot, and placed 4 ft. between the centres and connected by transverse tie rods, and with a clear span of 14 ft. for the two interior beams, and with the two outer beams supported on the side wall throughout their length, and with both a filling between the said beams, and a fireproof protection of the exposed parts of the beams of the system to be tested, constructed as in actual practice, with the quality of material ordinarily used in that system and the ceiling plastered below, as in a finished job; such filling between the two interior beams being loaded with a distributed load of 150 lbs. per square foot of its area and all carried by such filling; and subjecting the platform so constructed to the continuous heat of a wood fire below, averaging not less than 1,700 degs. Fahr. for not less than four hours, during which time the platform shall have remained in such condition that no flame will have passed through the platform or any part of the same, and that no part of the load shall have fallen through, and that the beams shall have been protected from the heat to the extent that after applying to the underside of the platform at the end of the heat test a stream of water directed against the bottom of the platform and discharged through a $1\frac{1}{2}$ in. nozzle under 60 lbs. pressure for five minutes, and after flooding the top of the platform with water under low pressure and then again applying the stream of water through the nozzle under the 60 lbs. pressure to the bottom of the platform for five minutes, and after a total load of 600 lbs. per square foot uniformly distributed over the middle bay shall have been applied and removed, after the platform shall have cooled, the maximum deflection of the interior beams shall not exceed $2\frac{1}{2}$ ins. The Commissioner of Buildings may from time to time prescribe additional or different tests than the foregoing for systems of filling between iron or steel floor beams, and the protection of the exposed parts of the beams. Any system failing to meet the requirements of the test of heat, water and weight as herein prescribed shall be prohibited from use in any building hereafter erected. Duly authenticated records of the test heretofore made of any system of fireproof floor filling and protection of the exposed parts of the beams may be presented to the Commissioner of Buildings, and if the same be satisfactory to said Commissioner it shall be accepted as conclusive.

Protection against Injury by Freezing.

No filling of any kind which may be injured by frost shall be placed between said floor beams during freezing weather, and if the filling is placed during any winter month it shall be temporarily covered with suitable material for protection from being frozen.

Cinder-concrete Filling on Top.

On the top of any arch, lintel or other device which does not extend to the plane of the underside of the floor finish, cinder-concrete or other suitable fireproof material shall be placed to solidly fill up the space to a level with the top of the said floor beams, and shall be carried to the underside of the wood floor boards in case such be used.

Cinder-concrete shall be made with not less than 1 part of Portland cement by volume to 10 parts of other material, and the top flanges of all beams shall be entirely embedded in it to a depth of not less than 2 ins.

Temporary Centering.

Temporary centering when used in placing fireproof system between floor beams shall not be removed within twenty-four hours, or until such time as the material has set.

Strength for Fireproof Floor Fillings.

All fireproof floor systems shall be of sufficient strength to safely carry the load to be imposed thereon without straining the material beyond its safe working load.

Pipe Openings through Fireproof Floors.

Openings through fireproof floors for pipes, conduits and similar purposes shall be shown on plans filed in the Department of Buildings.

After the floors are constructed no opening greater than 8 ins. square shall be cut through said floors, unless properly boxed or framed around with iron. And such openings shall be filled in with fireproof material after the pipes or conduits are in place.

Roof Domes.

Nothing in this section contained shall be deemed to prohibit the construction of the roof domes provided that the materials used therefor are in accordance with those specified in this section, and that the unit stresses do not exceed those fixed in this code, and that the construction shall be satisfactory to the Commissioner of Buildings.

Encasing Interior Columns.

All cast-iron, wrought-iron or rolled steel columns, including the lugs and brackets on same, used for vertical supports in the interior of any fireproof building, or used to support any fireproof floor, shall be entirely protected with not less than 4 ins. of hard-burned brickwork, terra-cotta, concrete or other fireproof material, without any air space next to the metal, securely applied; but no plaster-of-Paris or lime-mortar shall be used for this purpose, nor shall any plaster, whether or not on metal lathing, be considered a part of the covering required.

No single block or unit of insulating material used for column covering shall have a greater vertical dimension than 6 ins. when placed in position, nor shall the shells and webs of hollow tile or terra-cotta blocks be less than 1 in. in thickness, and these blocks shall be laid up with Portland-cement mortar, and suitably tied or anchored together.

The extreme outer edges of lugs, brackets and similar supporting metal may project to within $\frac{1}{2}$ in. of the surface of the fireproofing.

The fireproof coverings shall start upon the fireproof floors and continuously extend to the fireproof ceilings or underside of girders above, and be entirely independent of any ornamental base or capital.

No pipes, wires or conduit of any kind shall be encased in the fireproofing surrounding any column, girder or beam of steel or iron.

Where the fireproof protection of columns is exposed to damage from the trucking or handling of merchandise, such fireproof protection shall be jacketed on the outside for a height not less than 4 ft. from the floor with sheet metal or with vertical strips of oak; and if the oak be used for such purpose the vertical strips shall be sufficiently separated from each other always to show that the woodwork of the guard has been placed entirely on the outside of the fireproof material which encases the metal column.

VIEW SHOWING FERRO-CONCRETE FLOOR SUSTAINING BURNT-OUT PORTION OF ADLER CYCLE COMPANY'S WAREHOUSE AT FRANKFORT-ON-MAIN.

THE FIRE-RESISTANCE OF FERRO-CONCRETE.

AN interesting pamphlet has just been published by Mr. L. G. Mouchel, of 38, Victoria Street, London, S.W., the licensee of the Hennebique Patents for this country, in which particulars and illustrations are given of the results of some actual fires that have taken place in buildings constructed in Hennebique ferro-concrete. Two of these illustrations are reprinted herewith.

Instructive as tests may prove, there always remains in one's mind the thought that all the constructions used for the tests may have been made with special care, or, at any rate, with much more care than would be exercised in the case of an ordinary building; therefore, one is apt to wonder how a construction erected in the ordinary course of business would have stood the ordeal of a violent fire. Such doubts are dispelled by the results of actual conflagrations in various buildings erected on the Hennebique system by the firm's licensed contractors in various parts of the world. The following are abstracts of accounts given in the pamphlet which demonstrate that these buildings erected by different contractors, and composed of materials of absolutely different origin, have shown in every case eminently satisfactory results:—

A fire at the electric power station of Chèvres which occurred in September, 1898, resulted in its destruction, the iron girders, beams, &c., being twisted into all kinds of fantastic shapes and the ground being actually covered with an indescribable mixture of molten metal, showing the intensity of the fire. The only part which the fire left intact at the western end, where the fire was fiercest, was the gallery in ferro-concrete, constructed on the Hennebique system. The roof and all the floors were consumed, the burning débris falling on the Hennebique floor which covered the pump-room, and it was this floor which stopped the fire. It remained perfectly intact. The pumps, being thus protected, escaped injury.

A fire occurred in October, 1900, at a six-storey warehouse of the

Adler Cycle Co. at Frankfort-on-Main, all the floors and pillars of which were in Hennebique ferro-concrete, the walls being of brick. The fire broke out on the fourth floor, where a large stock of celluloid was kept. A violent explosion followed, which completely blew outwards the brick walls of the upper floors, lifted the roof in the air several feet high, and caused the upper storeys to fall back with terrific force on the floor of the third storey. That floor withstood the impact without damage, and saved the lower storeys from destruction. The view published shows the floor sustaining the enormous load of débris.

A fire which raged for two hours in July, 1901, at Mr. Van Hoegarten's spinning mill at Court St. Etienne, Belgium, did no damage to the Hennebique ferro-concrete construction.

At the dye works of Mr. Paul Miray a fire occurred in the Hartmans' dryer, installed in a building constructed on the Hennebique system. This building remained intact, and

acted as a fire screen, preserving the upper and lower floors and surrounding buildings.

The casino of Trouville was partially destroyed by fire in 1900, the saving of a portion being due to a floor in Hennebique ferro-concrete.

The dye works of the Union Industrielle de Tarare (France) were completely destroyed by fire except for a floor constructed in Hennebique ferro-concrete, which remained intact, sustaining heavy débris of machinery.

A fire at a maltings at Furnes, Belgium, in November, 1905, destroyed the two floors of a storehouse constructed in concrete and steel joists, but the floor in Hennebique ferro-concrete resisted perfectly, although it had to carry the two floors which fell on it, with the goods stored upon them.

The second illustration here given is of a fire at Bilbao which occurred in September, 1902, in the stores of the "Bodegas Bilbaines." The Hennebique floor not only withstood the fire, but supported the shock produced by the fall of the roof and the walls.

A fire occurred in January, 1906, at Newcastle-on-Tyne in the seven-storeyed warehouse built entirely in ferro concrete in 1900, and belonging to the Co-operative Wholesale Society, Ltd., of West Blandford Street, Newcastle-on-Tyne. The fire broke out in the third floor of this building, where large quantities of bran were stored. The other floors were full of groceries of various kinds and other inflammable goods. When the alarm was given it took about two hours before the firemen could reach the seat of the fire, owing to the smoke and fumes. They brought to play two jets which were working at a pressure of about 100 lbs. per sq. in. As it was impossible to play the water direct on the burning materials, the jets were directed on the panel of the floor immediately above the worst part of the fire, and these jets were kept centred on the same spot for over an hour. Owing to the high pressure and the great force of the jets and the length of time they played on the intensely hot floor, a small portion of the ceiling rendering was disintegrated and the lower bars exposed for a small part of their length, but the floor itself was very little affected, and was repaired at a cost of a few pounds. The floor pillars and partitions were undamaged, and no water found its way to the floor below. The actual damage was absolutely confined to the goods of this floor.

HENNEBIQUE FERRO-CONCRETE FLOOR AFTER THE FIRE AT THE STORES OF THE BODEGAS BILBAINES BILBAO, SPAIN.

Modern Material at South Kensington. The Londoner wandering through the courts and galleries of South Kensington Museum rarely stops to consider its architectural features—a fact partly due to the long delays in its completion. The exterior indeed is now hidden by the great screen of scaffolding, behind which Sir Aston Webb's work, the Victoria and Albert Museum, is growing to completion. The court—or "courtyard" as popular parlance will have it—is remarkable for the combination of red brick and terra-cotta in deeply recessed loggias, triple arches, and small Venetian balustrades, while in the interior there is the court generally devoted to objects lent by private individuals, a court remarkable for an early and successful use of iron, glass and mosaic for the purposes of a museum. The court is divided by a gallery supported by coupled iron columns fluted in spirals, similar columns surrounding the entire area, with light arches of simple ironwork rising from them; they are painted in light brown and pale blue harmoniously combined, and touched with gold. The glass roof is supported by iron arches of similar style, the rivet heads emphasized by being gilt. The upper storey is a "blind" arcade, decorated with flat mosaic figures of architects and artists in colours on a gold ground; they are too numerous to mention, but William of Wykeham, Giotto, Cimabue, Ghiberti, Jean Gougon, Inigo Jones and Wren are exceptionally fine; while, at either end, in large lunettes on the walls, are Lord Leighton's great frescoes of industrial art applied to Peace and War. As another example of a different kind, but essentially a modern example, we may turn to the refreshment room. Here tiles are applied to the entire surface of the walls, mainly in cream white

or very light tones, the room being divided by an open arcade rising from coupled piers, all faced with tile, the piers having capitals of an Ionic character—a feature difficult to reproduce faithfully in that material: was it wise indeed to reproduce it at all, in the circumstances? The feature, however, which best deserves attention is the ceiling, painted in light arabesques on—iron! with thin sheets of that material fastened by rivets which are plainly seen. The chamber suffers somewhat from excess of decorative ornament, which covers every inch of available surface; the effect is rich, interesting and somewhat embarrassing, but after the Loan Court, flooded with light, the place is a little sombre and the transition too abrupt. There is an additional room adjoining it decorated in the low toned colours so much in vogue a few years ago—and here rendered even lower by a bad light. The galleries devoted to the exhibition of ceramic ware are also examples of tile decoration, and there is much in the interior of the building generally which speaks well for the artistic courage and freedom from convention of the men of "the day before yesterday."

The Nonchalant Planner.

THE haphazard way in which the English architect's planning of compartments seems to gather itself together has often been remarked upon and compared very unfavourably with the planning of French architects and those in America who have followed on the lines of the French school. The want of care is chiefly displayed in the design of domestic buildings. Of course, there is a good deal of excuse for this in respect of the smallest houses, because the question of cost stipulates that the building shall be squared-up, and thus the planning becomes a question of dovetailing rooms within the confines of the regular figure, but when we get beyond these into the large buildings there seems to us no excuse for irregular-shaped rooms and straggling plans. The method by which these are arrived at is evidently to start with a few general principles, and then to draw compartments of an approximate size and let the work in with each other as best they can. A corner is sheared off here and an unoccupied space of irregular shape thrown in there, with the result that nothing seems properly thought-out, yet it is apparent that by a little rearrangement a very much more logical solution of the problem could have been secured. All these little corners and irregular-shaped compartments are not only wasteful, but they often preclude the possibility of properly furnishing the rooms: furniture indeed is hardly ever considered. Architects seem to think that as there is so much variety in furniture their clients can just go and buy articles to fit the rooms, but in regard to almost all the most important

articles of furniture there are general sizes within which all the varieties come, and if there is no space for an article of furniture—and, indeed, if there is too much—the house is defective. Bedrooms, for instance, are often planned without any regard to the position of the bed, the placing of the chimney-breasts, or the positions of the doors and windows. The shape often means that a large room cannot be used for the purpose which its size warrants, and its appearance can never be made satisfactory. The same thing applies to other articles in the room besides the bed. There are wardrobes, chests of drawers, blinds and carpets to be considered, each in relation to the room and to each other. The other rooms in a house require just as much care. In the dining-room the table and sideboard need consideration, while in the drawing-room sofas, cabinets and pianos should be studied. One often finds the fire so placed that it is quite impossible to get a grand piano in a room of large dimensions without throwing everything else out of gear. Another very important room in any house is the kitchen. This compartment is most used of any in the house, and here space should be given for easy working. The furniture to be arranged for are tables, dresser, cupboards, &c. The scullery too has its special furniture. The question of furniture is important; therefore, because it is a necessary part of the lives of the occupants, and if the rooms are deficient in this respect they do not serve their function, and the planning must be held to be incompetent. Architects do not sufficiently enquire into the working of the buildings they design, and, what is of still greater importance, they do not take sufficient care. Not only is this want of thought too often visible in the planning of houses, but it applies in commercial buildings almost as much, although the fact that special requirements need special treatment seems more realized here, and, consequently, architects take the trouble to enquire about the more obvious things.

Line Drawings for Reproduction. WE are frequently asked by architects how line drawings for reproduction in our columns should be prepared. We would point out therefore that all plans should be in straightforward black and white, every line being clear; faint lines are useless, because, however effective they may look on the original drawing, they will come out in the reproduction just the same as the strong lines. Lettering should be large and bold—even rather coarse—and lines tending to thickness rather than to thinness. There must be no tinting, as this would come solid. With wash drawings or photographs the case is different, as they are reproduced by another process which renders all tones in proper gradation.

REINFORCED CONCRETE.

(All rights reserved.)

(Concluded from p. 177, No. 582.)

Double Reinforcement.

MOST beams are constructed with a single reinforcement only, this being placed in the tensile side. If we place a similar reinforcement in the compression side we have what is termed a double reinforcement.

Concrete in compression, when reinforced by longitudinal rods only, has, when under strain, no additional properties similar to those found by experiment when under tension. Thus the total strength of the portion in compression is the sum of that due to the concrete and to the reinforcement separately.

Assuming then, as before, that strain is proportional to the distance from the neutral axis, we may obtain fundamental equations similar to those of a single reinforcement, but more complicated, due to the additional reinforcement introduced. The following simpler method was proposed by Considère.

Suppose the beam in Fig. 11 to have at first a single lower reinforcement only, and that the position of the neutral axis has been found as in dotted line.

Let s = stress intensity on this lower reinforcement, and a = its area.

If now we add an upper reinforcement a_1 , and an additional lower reinforcement a_2 , so that $\frac{a_2}{a_1} = \frac{x}{y}$, the total stress above the neutral

axis will still equal that below, since additional areas are inversely as the stress intensities on them; and the additional moment due to the new couple introduced is $sa_2(x+y)$.

This method may be conveniently applied thus:—

To find, for example, the moment of resistance curve of a unit beam where the top reinforcement is one-half the lower. With the single reinforcement of 1 per cent. we find by the previous method $x = .625$ in. and $f = 30,000$ lbs. per sq. in. The reinforcement we will assume placed $\frac{a_2}{a_1} = \frac{275}{525}$ from the top of the beam. We have then

by principle above; and $a_1 = \frac{1}{5}(a + a_2)$, by condition that top reinforcement is one-half the lower; from these, since $a = 1$, we find $a_1 = .68$ per cent. and $a_2 = .36$ per cent., giving the total top reinforcement as .68 per cent. and the total lower as 1.36 per

cent. The additional moment is $f \times a_2 \times (.525 + .275) = 30,000 + \frac{36}{100} \times 0.8 = 86.8$ in.-lbs.

Adding that for a single 1 per cent. reinforcement 292.3 „

Total moment of resistance 379.1 in.-lbs.

Working out several cases, we get the full line curve on Fig. 12, the total percentage of reinforcement being plotted horizontally, and it is clear how similar curves can be obtained with a top reinforcement in any ratio to the lower. Comparing this curve with that on Fig. 3 (preceding article), we see how for high percentages of reinforcement we get a greater value of m with a double reinforcement but a less value with low percentages. This might have been anticipated, for looking at Figs. 3 and 5 we see that with high percentages the concrete is fully stressed while the steel is at a very low stress, and so inefficiently used. It is analogous to a steel girder with the lower flange much stronger than the top. So, clearly, it would be of advantage to remove some of the steel from the lower side and strengthen the weaker member—that is, the top side—with it, at the same time using the steel still remaining at a higher stress intensity, and thus more efficiently.

But at low percentages it is the lower side that is the weaker member (see Fig. 5); the steel is fully stressed and, of course, any removal to strengthen the top portion is only strengthening that which is already too strong and weakening that which is already too weak. If we do so we decrease the moment of resistance, as a comparison of Figs. 3 and 12 shows. At about 2 per cent. total reinforcement the bend in the curve shows we have the critical percentage; with a higher percentage the top portion, though reinforced, is still the weaker member, and thus beyond this value a double reinforcement of the same total percentage, but with a still greater proportion in the top, will give a still higher value of m .

Economic Percentage.

For cases of simple beams the following investigation gives an idea of the comparative economy of different percentages of reinforcement. We cannot perhaps state exactly the relative cost of the constituent materials in the beam, but, pricing the concrete at 24s. per cub. yd. and the steel at £7 per ton, and taking its weight at 450 lbs. per cub. ft., gives the relative cost of steel to concrete at 100 to 2.9 per equal volumes.

We may take also such proportion as 100 to 3.4 and 100 to 2.4, and we will have curves practically parallel to those to be deduced, showing that the principle holds for reasonable variations of cost. Adopting the ratio 100 to 2.9, we can easily compile Table IV. For the various percentages of reinforcement we have the values of m for the unit beam where $b = d$. Its area is 1 sq. in., which we have multiplied by 100 to avoid decimals—making clearly no difference for comparative results. The areas of each element are next given, and multiplying by 2.9 and by 100 gives the cost of each and the total cost. Then $\frac{\text{total cost}}{m}$ is the cost per in.-lb., and

is the cost number for comparison as to the most economic percentage of reinforcement. It is seen from the table and also from Fig. 13, plotted from these values, that the critical percentage is also the most economic but that the comparative cost rises very slowly for percentages higher than the critical and much more quickly for percentages lower than the critical. This table is for a beam proportioned with $b = d$; but the curve will be of the same type whatever ratio b is to d provided $b \times d = 1$. For instance, if $b = \frac{4}{5}$ in. and $d = \frac{5}{4}$ in. (whence b is almost

$\frac{2}{3}d$) the area remains constant and so the cost also. The value of the moment of resistance for this unit beam is now

$$m \times b d^2 \quad m \times \frac{4}{5} \times \left(\frac{5}{4}\right)^2 = 1.4m.$$

Hence $\frac{\text{cost}}{\text{moment of resistance}}$ is now $\frac{4}{5}$ ths of

its former value for each percentage, and so the curve will be flatter but will rise or fall in the same way.

As already stated, the critical percentage is also the most economic, which, it may be said, is quite to be expected, since at that point we are working both steel and concrete at their maximum allowable stress intensity. But if we increase the relative cost of steel and concrete to 700 to 2.9, the cost numbers so calculated are shown in the second lowest row of Table IV.; and if we increase to 1,000 to 2.9, they are as shown in the lowest row, in which case the cost rises continually with the percentage reinforcement. It is a question of whether the increased moment of resistance obtained by the higher percentage of reinforcement is proportional to the extra

cost of the steel relative to the concrete. It is clear that if the relative cost of the steel were such as to make that of the concrete negligible, the cost number would increase continually with the percentage unless a proportionately higher moment of resistance was obtained. Fig. 3 shows this is not so, hence the cost number would rise continually. So at about the actual relative costs the critical and economic percentages agree, but this is a coincidence only.

If now we calculate in a similar way the cost numbers for a double reinforcement, we shall find that the critical percentage is again the most economic, and that the cost number at this percentage (2 per cent. total) is 1·30—practically the same as that of a single reinforcement at its economic percentage. The curve so found is also shown on Fig 13. If we

compare the curves with $b = \frac{2}{3}$ in. and $d = \frac{3}{2}$ in.

in both types of reinforcement we shall obtain the same result; and this is so no matter what ratio b is to d , as is obvious from previous considerations of the effect of this ratio. If we calculate similar curves with $b = d = 1$, or b in any ratio to d , on a basis of a parabolic stress diagram above the neutral axis, taking also $c = 500$ and $f = 10,000$, we again find a similar result. This is contrary to the general idea of the relative economy of single and double reinforcements. This method of comparison has been proposed, but it hardly represents the practical side of the question, for we have compared the costs of beams of the same size but with different percentages of reinforcement, and so each develops a different moment of resistance. Percentage reinforcement being the same, the cost varies as bd , while the moment of resistance varies as bd^2 ; hence for a large beam the ratio $\frac{\text{cost}}{\text{moment of resistance}}$ is less than for a smaller one. Practically we want the most economic beam possible to develop a definite moment of resistance; as we increase the percentage of reinforcement, m increases, and so the size of the beam to develop this definite moment of resistance decreases; hence the cost of a high percentage relative to that of a lower percentage beam, if each develops the same moment of resistance, will be greater than that given in Table IV. and Fig. 13.

Working out a case for different percentage reinforcements of beams to develop a definite moment of resistance, we shall find this corroborated. We must adopt some ratio of b to d —say $b = \frac{2}{3}d$.

If M = moment of resistance, $M = mbd^2 = \frac{1}{2}md^3$.

α may have any value; different values will only alter the gradient of the curve and make no difference in the position of the minimum value of the cost number; and it will not effect the comparison of single and double reinforcement cost numbers as regards this minimum value.

Taking $M = 1,000,000$ ins.-lbs., to find the cost of a 1 per cent. single reinforcement beam we have $1,000,000 = \frac{2}{3} 292 \cdot 3 d^3$, whence $d = 17 \cdot 24$ ins. and $b = 11 \cdot 49$ ins. Hence area of

concrete = 196 sq. ins. and reinforcement
198 sq. ins.

Cost of concrete	$196 \times 2.9 = 569$
------------------	------------------------

Cost of reinforcement $1.98 \times 100 = 198$

Total - - 767

For a 2 per cent. total reinforcement of which the upper is one-half the lower, $d = 15.8$ ins. and the cost comes out 818—higher than that of the single reinforcement, and both are taken at their critical percentages. Curves so found for different percentages are shown on Fig. 14. It is seen that in this figure also the critical percentage is in both cases the economic, but that the most economic beam of all is that with a single reinforcement. If, however, for any reason we adopt a higher percentage of reinforcement, the double reinforcement becomes the less costly, and more so the greater the percentage. Hence, if owing to limitation of constructional depth we adopt a beam of small depth it may be necessary to use a high percentage of reinforcement, and in this case from either method the double reinforcement will be the more economic.

Comparing the cost at high with that at low percentages, it is seen that it is much higher proportionately in the curves of Fig. 14 than in those of Fig. 13.

This comparative cost result cannot, of course, be rigidly applied in practice, as it is deduced from the consideration of a single isolated beam, while in actual structures other factors of influence come in. But it can be taken into account and be given its due weight in the actual circumstances just as is done in other types of construction.

The curves deduced here are only for this method of calculation and for the unit stresses adopted. But whatever unit stresses are adopted it is evident that similar curves may be obtained; and that of Fig. 3 enables the necessary size of a beam to develop any moment of resistance to be found with very little labour. And whether we adopt in calculation Considère's method as described here, Professor Hatt's method as described in the "Engineering Record" (1902), that given in Marsh's "Reinforced Concrete," or any of the other proposals put forward, similar curves may be obtained.

T-Shaped Beams.

So far we have dealt with beams rectangular in cross-section in order to show the method of calculation. But in most practical cases the beams are T-shaped—a portion of the floor forming the table of the T and adding to the moment of resistance of the beam. Having shown the principles of calculation by consideration of rectangular beams the investigation of T-shaped beams is a simple step. In our calculations we will, as is recommended by most investigators, neglect the tension of the concrete, knowing now that it gives a greater factor of safety below the critical percentage and makes little difference above that percentage; it greatly simplifies calculations of T-beams however, as will be seen from the investigation to follow.

Fig. 15 shows a section of a floor; the

slabs between the girder-beams are calculated as rectangular beams; but since the whole of the concrete of the slab is not at the maximum allowable stress, it is customary to include part of the slab in the cross-sectional area of the girder-beams also. To take length a_1 as the table of the T seems excessive, considering it is already under stress as a floor slab; we will take length a_2 as forming the table, where $a_2 = \frac{1}{2}a_1 = \frac{1}{2}$ distance between the girder-beams—that is, the table extends on each side one quarter the distance apart of the girder-beams. Suppose the dimensions of the T beam are as on Fig. 16, and let $b = 24\text{ins.}$, $d = 16\text{ins.}$, $b = 8\text{ins.}$, $d = 4\text{ins.}$

Consider the beam at present as of solid section $b \times d$ and that $p = \frac{3}{8}$ per cent. of $b \times d$. By former methods we find $x = .778T$. The neutral axis then lies $.778 \times 16\text{ins.} = 12.45\text{ins.}$ from the bottom of the beam, or 0.45in. above the lower edge of the T, as shown by a_1, a_1 . Since we have neglected the tension of the concrete, clearly the fact that the beam is not of solid rectangular section below a_1, a_1 makes no difference to the calculated strength, and hence the moment of resistance of the T-beam is $m b d^2$, where m is the value of the moment of resistance of the unit beam with $\frac{3}{8}$ per cent. reinforcement calculated with $t = 0$.

Take next a case when $p = 1\frac{1}{2}$ per cent. of $b \times d$, and consider again that beam is of solid section $b \times d$. We find that in this case $x = .61$, and the neutral axis now lies $.61 \times 16$ ins. = 9.76 ins., that is, 2.24 ins. below the lower edge of the table, as shown by a_3, a_2 . It again does not matter for the section of the concrete in tension, as it is neglected, but in these calculations the concrete is supposed of complete rectangular section above the neutral axis. This is not so now, and with this value of x it is clear that, owing to the lessening of the concrete area, c will be less than r .

We must establish new equations for a case where the neutral axis falls below the lower edge of the table. Taking dimensions as on Fig. 16, let p = ratio of reinforcement to $b \times d$; k and u as before; and also let $b = m b_0$, and $d = n d_0$, where m and n are less than unity. We have under assumptions as in the former case of rectangular beams,

$$\frac{c}{kf} = \frac{1-x}{x-u} \quad . \quad . \quad . \quad (4)$$

This is exactly as equation (1) before ; and for the second equation we have

$$\frac{c}{2} \text{BD} (1-x) - \frac{c_1}{2} (B-b) \{D(1-x) - d\} = f p \text{BD},$$

where c_1 = stress on the concrete at the underside of the table—that is,

$$\frac{c}{2}(I - x) - \frac{c_1}{2}(I - m)(I - x - n) = fp.$$

But $\frac{c_1}{c} = \frac{D(1-x) - d}{D(1-x)} = \frac{1-x-n}{1-x}$.

Hence $\frac{c}{2}(1-x) - \frac{c(1-x-n)^2(1-m)}{2(1-x)} = fp$,

which becomes

$$\frac{c}{2(1-x)} \{ (1-x)^2 - (1-m)(1-x-n)^2 \} = fp.$$

If $b = B$, then $m = 1$, and we have the former equation (2). Putting value of f from (4), this becomes on cancelling

$$\{(1-x)^2 - (1-m)(1-x-n)^2\} = \frac{2p(x-u)}{k} \quad (5)$$

This equation enables us to find the neutral axis when we know that it must fall below the lower edge of the table. Applying it to the above case—

$$(1-x)^2 - (1-\frac{1}{3})(1-x-\frac{1}{4})^2 = \frac{2 \cdot \frac{1.5}{100} (x-\frac{1}{10})}{\frac{1}{10}}$$

This becomes $x^2 - 3.9 \times 1.965 = 0$.

A root must be between 0 and 1, and drawing the graph for this portion gives $x = .592$.

The neutral axis is now lowered to .592 × 16 ins. = 9.47 ins. from the bottom of the beam, or 2.53 below the underside of the table.

Taking moments of c and F about the neutral axis, we have

$$M = \frac{c}{2} D (1-x) B \frac{2}{3} D (1-x) - \frac{c_1}{2} (B-b) \left\{ D (1-x) - d \right\} \frac{2}{3} \left\{ D (1-x) - d \right\} + f p B D \cdot D (x-u),$$

which becomes

$$\frac{M}{B D^2} = \frac{c}{3} \left\{ (1-x)^2 - \frac{1-m}{1-x} (1-x-n)^2 \right\} + f p (x-u) \quad (6)$$

From the position of the neutral axis it is clear that $c = 2,140$ lbs. and $f = 25,750$ lbs.

per sq. in. Calculating $\frac{M}{B D^2}$ from equation

(6), we get, with $p = 1\frac{1}{2}$ per cent. of $B D$,

$$\frac{M}{B D^2} = 115 + 190 = 305 \text{ ins.-lbs.}$$

If now, to avoid the lengthy equation (5), we use equation (2), thus finding $x = .61$ as before, but adopt equation (6) to determine the moment of resistance, we obtain

$$\frac{M}{B D^2} = 105 + 214 = 319 \text{ ins.-lbs.}$$

In this case $c = 2,140$ and $f = 27,950$ lbs. per sq. in. In each case the first portion of

$\frac{M}{B D^2}$ is that due to the concrete and the second that due to the reinforcement; of course, taking $x = .61$, the total compression and tension over the section cannot balance.

If, as a second approximate calculation, we assume the beam to be of solid section $B \times D$, we can find the moment of resistance by equation (3); $f = 27,950$ lbs. per sq. in.

again, $x = .61$, and $\frac{M}{B D^2} = 323$ ins.-lbs.

Comparing these approximate calculations with the correct calculation, the first is 4.6 per cent. and the second 5.9 per cent. in excess.

In this example the neutral axis is well below the lower edge of the table, and, finding a difference of only about 6 per cent. between the correct calculation and the approximate calculation by assuming the beam of solid rectangular section, it is doubtful if it is worth while to use the more tedious equations (4), (5) and (6), especially when we consider that the breadth B is fixed by the very arbitrary assumption that it is half the distance between the girder-beams. It would seem that by calculating the moment of resistance on the assumption of a solid section $B \times D$, and deducting a percentage depending on the position of the neutral axis, we would obtain a result accurate enough for practice with much less work than by adopting the correct equations (4), (5) and (6). The percentage to be deducted for T-beams of various proportion and with different positions of the neutral axis could be determined by working out a few examples by the correct and approximate methods, and tabulating them. Then the curves of Figs. 3 and 4 with this correction would be applicable to T-beams also. To draw curves of $\frac{M}{B D^2}$ for T-beams calculated by the correct equations would involve a large number of curves in order to give the value for any proportion of beam—that is, for any value of m and n and with all possible and practical combinations of these values.

Had we left out the projecting portions of the floor slab in the calculation of the girder-beams we would have had a solid rectangular beam $b \text{ in.} \times d \text{ in.} = \frac{1}{3} B \times D$ in section. The reinforcement of $1\frac{1}{2}$ per cent. of $B D$ is now $4\frac{1}{2}$ per cent. of $b d$, and the moment of resistance is $m b d^2$. From curves of Fig. 3 $m = 432$, for $p = 4\frac{1}{2}$ per cent.

Hence moment of resistance is $M = 432 b d^2 =$

$432 \frac{1}{3} B D^2 = 144 B D^2$, or $\frac{M}{B D^2}$ is now 144. The gain in strength due to the monolithic character of this construction is therefore $305 - 144 = 161$ ins.-lbs. This is in the ratio of $\frac{161}{144}$, or 111 per cent. Comparing similarly the case where $p = \frac{3}{8}$ per cent. of $B D$, or $1\frac{1}{2}$ per cent. of $b d$, the gain is 72 per cent., the less increase being due to the fact that from $\frac{3}{8}$ per cent. to $1\frac{1}{2}$ per cent. the increase of m is much greater proportionately than from $1\frac{1}{2}$ per cent. to $4\frac{1}{2}$ per cent. reinforcement.

Double Reinforcement T-Beams.

In a T-beam with double reinforcement—the top being one-half the lower reinforcement—the curve of Fig. 12 gives the value of

$\frac{M}{B D^2}$ provided the neutral axis lies within the table section. If not, we would have to establish equations similar to (4), (5) and (6), including also the top reinforcement stresses, since Considère's method for double reinforcement, previously described, is suitable to get curves of m only and not to get the moment of resistance of a definite section. For the same reasons as with single reinforcement, the curves of Fig. 12 with a correction depending on the position of the neutral axis would seem to give sufficiently accurate values of $\frac{M}{B D^2}$ —this varying correction to be determined as before.

In adopting the results of calculations carried out as described here it is necessary in all types of beams to be sure that the beam is of sufficient strength to resist the shearing stresses induced. Especially is this so in the case of T-beams; it is this consideration, in fact, that is an important factor in determining the limiting proportion of such beams. For, considering the tendency to shear along the horizontal plane at the lower edge of the table, the total shearing stress along this plane for half the length of the girder produces the total stress in the table at mid-span, if the maximum bending moment occurs there. The ratio of b to B to effect this without exceeding the maximum allowable stress intensity in shear depends then on the relative ratios of this allowable shearing stress intensity to that of compression, and of D , d , and b to the span. A general rule is that if b is not greater than $6b$ ample allowance is made for this stress.

Calculations for the reinforcement necessary for shearing stresses were not, however, taken up in the paper, as it would have caused it to be of undue length.

LOUTH, LINCOLNSHIRE.

By W. H. Watts.

LINCOLNSHIRE is one of the richest in architectural interest. Despite the small number of important towns and the comparatively sparse population, its architectural monuments are surprisingly numerous. The cathedral city of Lincoln—one of the most ancient towns in the country, Stamford with its many churches and fine old houses, and Crowland Abbey—are instances familiar to every architectural student.

The town of Louth, though not so famous as any of the places mentioned, has an interest all its own. It contains many buildings quite worthy of careful study.

First attention has been given to the church, which is undoubtedly the finest in the county, but the Renaissance work in the town seems to have been ignored by students; yet several houses date from about 1600 and are good examples of the Early English Renaissance period, though the greater quantity of work belongs to the Later English Renaissance period, and the continuous decay through the Georgian and Early Victorian classic is recorded in many of the houses. The character given by the better work, however, has preserved the town from many of the banalities. The Gothic Revival and later manners have had little opportunity of leaving their impress, as there has been little call for extensive building, and so to-day Louth remains a fine Renaissance town surrounding a noble Gothic church. Its quiet streets carry one back to the provincial life of the eighteenth and early nineteenth century—it typifies for us the life of our great-grandfathers. Nothing is known of the early architects who so dominantly stamped their individuality on the houses, but it is evident they were men of no mean ability, and it is very possible that some of the earlier work, if not the later, might be traced to well-known men of the period. Apart from this, however, the history of the town can be followed fairly easily. Louth is of course small compared with modern manufacturing towns, but it was of considerable importance in the days when England was chiefly engaged in agriculture, for towns then were merely centres for the district.

Louth is situated in the centre of a rich grazing and agricultural area, and about ten miles as the crow flies from the sea. It derives its name from the Lud—the small river on the banks of which it is built. It

CHURCH OF ST. JAMES LOUTH.

was known in ancient times as Ludes or Luda, and natives call themselves by the resounding title Ludensians. Evidence of its occupation by the Romans has been discovered, several Roman coins having been found in various parts of the town. It is thought that a branch road from the Foss way reached here. In 1822 some ancient oak coffins supposed to date from Saxon times were discovered in the Market Place, and the town is also mentioned in the Domesday Book. Louth Abbey, situated about a mile from the town, was founded about 1140.

The inhabitants have on several occasions taken a more or less prominent part in the many religious risings which have occurred in Lincolnshire. There is some record of these disturbances as far back as the reign of King John, but the principal one was the Lincolnshire Rebellion during the reign of Henry VIII. After the suppression of this rising the vicar of Louth, together with a number of other men, was executed at Tyburn. Some small part was also taken in the civil war between Charles I. and Cromwell. The latter passed through the town after the battle of Winceby.

The period of Louth's greatest prosperity, when the majority of its Renaissance work was erected, was after the construction of the canal which runs from here to Hull. The fever for constructing canals which occurred before the railway boom brought prosperous times in many cases to agricultural districts, and built up industries that had been forced to remove to more convenient centres or had decayed by competition from those more favourably situated. The railway came to Louth later, but has done little for it. The canal at Louth was completed about 1765. A few vessels still trade with Hull, Grimsby and London, but its prosperous days are over: hence we see on the banks of the canal many disused mills and factories.

Without doubt the town enjoyed its greatest prosperity in the latter part of the eighteenth and early part of the nineteenth century. This was the time during which the canal flourished, and there are also several other facts which bear out this conclusion. One of the largest factories bears the date 1818 and the pump in the Market Square 1820. There are also several houses which date from about a century ago to 1830, and but a few years later than this the Town Hall and new Corn Exchange were built.

The first thing one notices on approaching the town from any direction is the church. Lincolnshire churches are as famous as they are numerous, and of them all the finest is St. James's, Louth. The graceful outline of the tower and spire can be seen for miles around. The nave and aisles are, without doubt, the oldest portions of the building. They were commenced some time in the thirteenth century and completed about the year 1380. The nave is very lofty, although viewed from outside the great height of the spire gives it a long low appearance. It is built on the site of a much narrower one, the foundations of the piers of which were discovered during comparatively recent excavations. The chancel, built about 1480, consists of four bays of lofty pointed arches. The east end of the church contains a very fine window flanked by two canopied buttresses and surmounted by a parapet, termi-

CHURCH OF ST. JAMES, LOUTH.

From "Gothic Architecture in England" (Batsford).

nating in a cross. Pinnacles surmount the buttresses on each side of the church.

The most interesting portions of the church are the north and south doorways, and some of the pillars and arches of the nave, which are the only remains of the older church. These are fine specimens of early thirteenth-century work.

The tower and spire, together nearly 300 ft. high, are of very beautiful design. The tower is extremely massive, the walls of some portions being 7 ft. thick, and it is thought at one time to have stood detached. The lower portion contains the western doorway, and a five-light Perpendicular window, with coupled windows over the aisles on the north and south sides, and a lofty arch opening into the church on the east. Above this on all four sides are coupled two-light windows deeply recessed, and above this again similar windows and with richly ornamented canopies. The finials, pinnacles and the flying buttresses to the spire complete a tower than which for beauty of design and graceful proportion no superior can be found.

Restoration of various portions of the church have been frequent, but, on the whole, have been marked by extreme care and taste, a feature too often lacking in church restoration of modern times. The church is in an excellent state of preservation and, with due care, no drastic renovation will be necessary for a great many years.

The tower in its present form was completed in the year 1844 under the supervision of Mr. L. N. Cottingham. In 1861 the chancel and east window were restored, and at the same time the church was repaved and reseated, and again in 1869. A reredos has been added and both the porches rebuilt, the south being from the designs of a Mr. Withers. The restorations were carried out under the supervision of a local architect, Mr. James Fowler. The sedilia have been restored and two new stained-glass windows inserted in the north aisle and two in the south aisle.

The church was considerably damaged during the time of Cromwell by the Puritans, and quite a number of images and figures were taken from niches in the outside walls,

DOORWAY IN WESTGATE.

as they were considered to be symbols of Popery. A spot on the London Road is still shown where Cromwell is said to have placed cannon in position to demolish the church, but at the last moment the beauty of the structure overcame even his inartistic soul, and he countermanded the order for its destruction.

As a whole it is a spacious and elegant building in the Perpendicular style, lacking however much of the elaborate and stiff decoration common to this style, doubtless owing to the fact that it is a comparatively early specimen.

The original parish church, St. Mary's, stood on the north-west side of the town somewhat back from the road. It is known to have been in a dilapidated condition during the reign of Henry VII., and in 1552 the portions then standing were used as the grammar school. No portion, however, is now existing, and, in fact, the exact site is not known.

The earliest Renaissance work in the town is to be found in Westgate. In this delightful old street almost every house is of interest and many are of early date, namely about 1600. This evidently was the chief residential street in the earlier part of the town's history. Several views of houses in this street are given in the centre plates of the present issue, but one is compelled to omit some which are of interest because of the impossibility of obtaining photographs owing to the narrowness of the street. There

are hardly two houses alike, although they are very similar in character. On this page are given a photograph of a doorway and an interior view of one of the houses in Westgate, the list of the occupiers of which is

in existence, the names dating from 1610. Another house in this street, illustrated in the plates, had a doorway in place of the centre window which gave relief to the front, but the present occupier recently had the entrance transferred to the side. The other house in this street of which two illustrations are given in the centre plates is evidently of later date.

The work of the later period is to be found in a good many streets in the town; illustrations are here given of the houses in Uppgate (the London road) and in the Corn Market and Bridge Street. Respecting the buildings in the Corn Market, that shown on the left of the view in the centre plates has typical old shops below and a meeting-hall above. The other view shows early shop fronts of different date, together with a heavy pilastered front in stucco of the late debased kind, but still preserving some sedateness. In the corner of this square is the Corn Exchange itself, an atrocious example of later "Italian Renaissance" work, profusely decorated. This dates from about 1867, and is constructed of an exceedingly soft stone which is rapidly decaying.

The largest building in the town next to the parish church, and excepting a factory or two, which have been built within the last few years, is the town hall. This was built in Italian Renaissance style in 1854. Although a large and pretentious building, it has been erected in the narrowest part of the street, and, fortunately, by reason of its position, does not obtrude. It also is weathering badly.

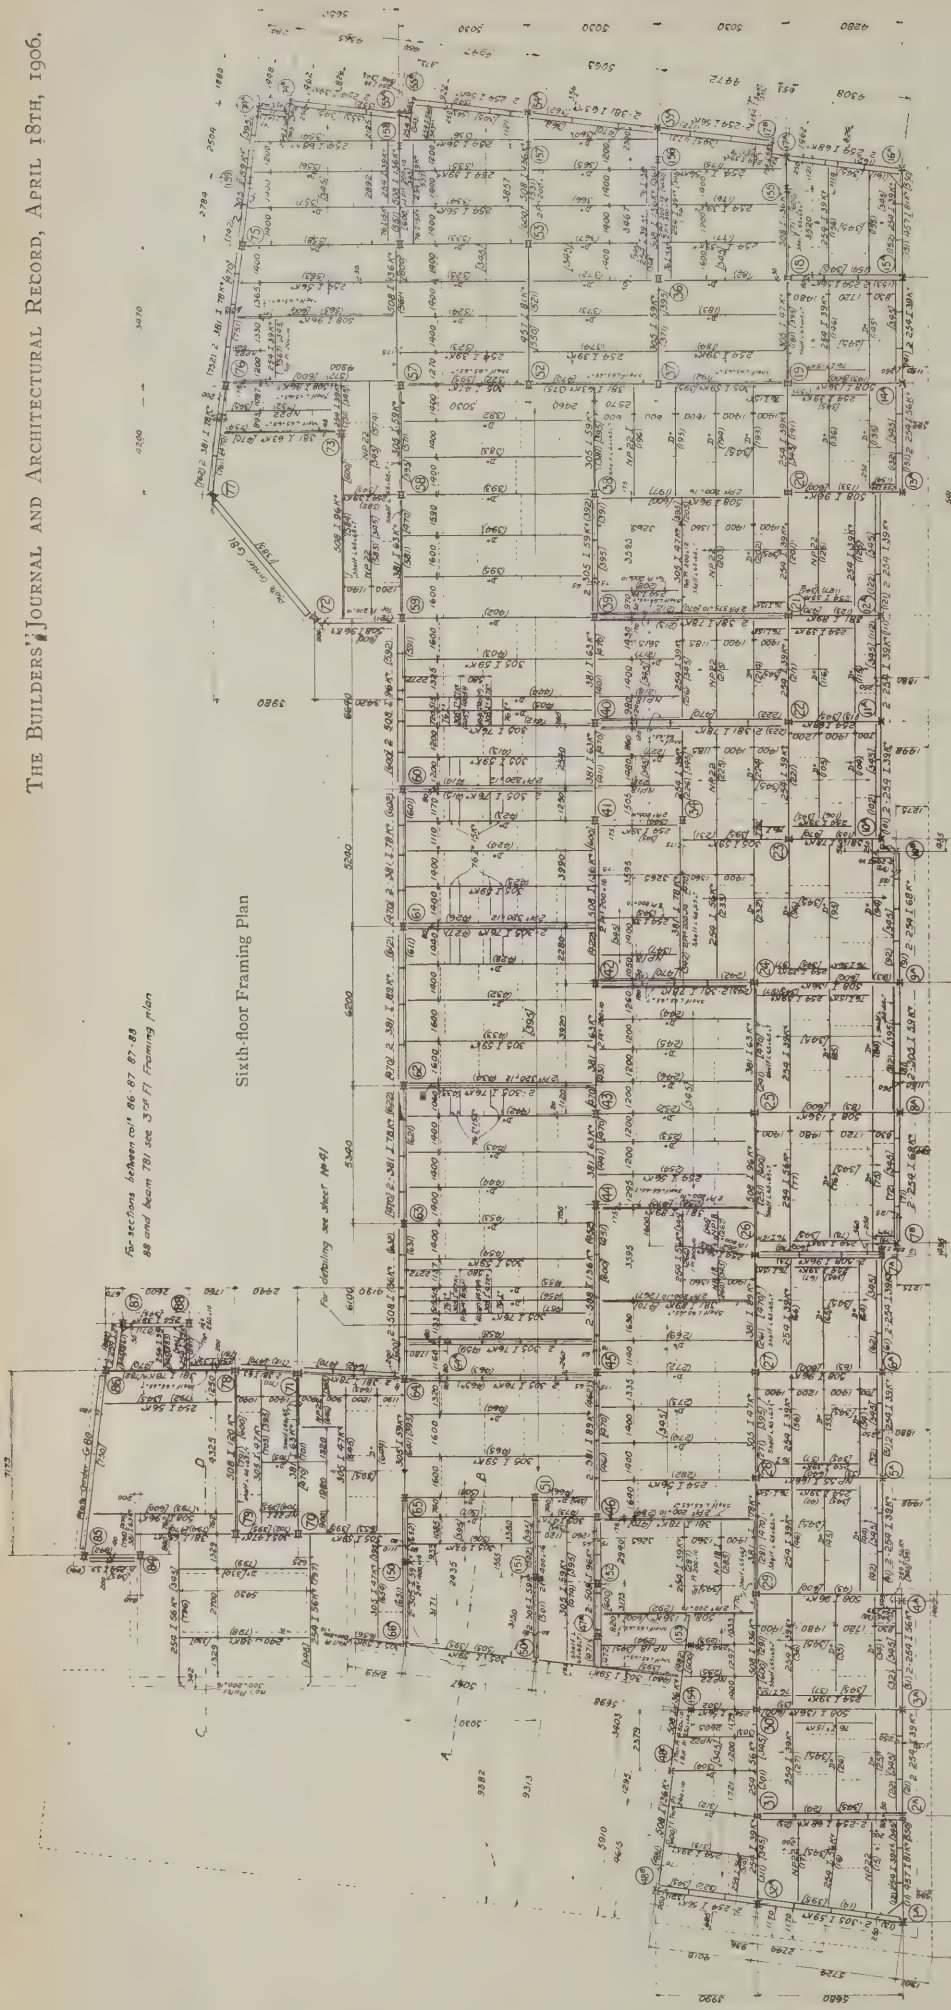

There are several Nonconformist churches in the town which date from about 1820 to 1850. Some of these are quiet and reserved, and others more pretentious, but all conform to the Renaissance character of the town. Several of the mills and granaries at the river head and on the banks of the canal and the River Lud are of some architectural interest, although of a plain character.

As regards modern work in the town, t only other buildings of particular interest are the grammar school and the hospital, both which are in the Elizabethan style. The grammar school, which has educated several well-known men as Sir John Franklin and Tennyson, stands in Schoolhouse Lane, and was erected from the designs of Mr. Jam Fowler. The original school was founded by Edward VI., together with a hospital to accommodate "twelve poor people." The hospital now takes the form of twelve almshouses, the occupants of which have a weekly allowance.

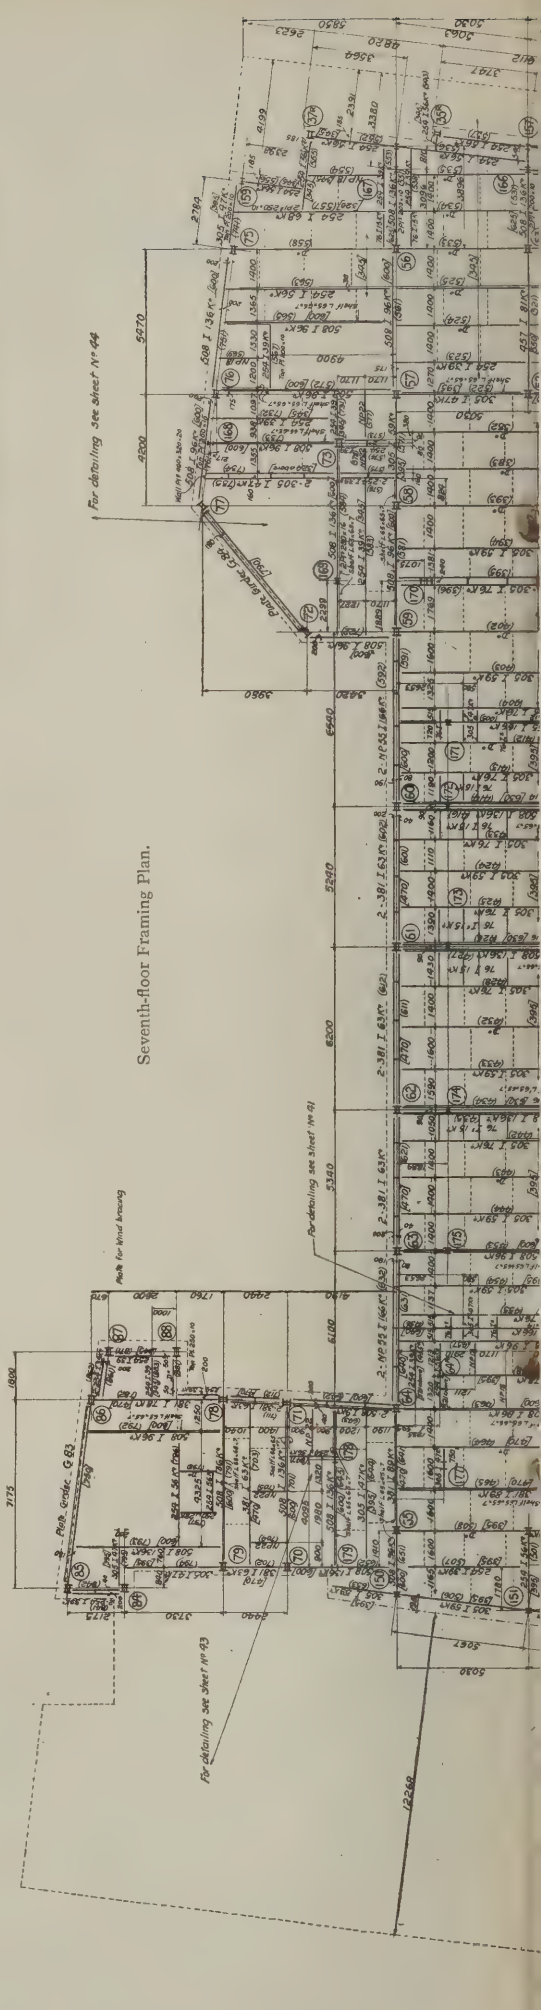

HALL AND STAIRCASE TO HOUSE IN WESTGATE.

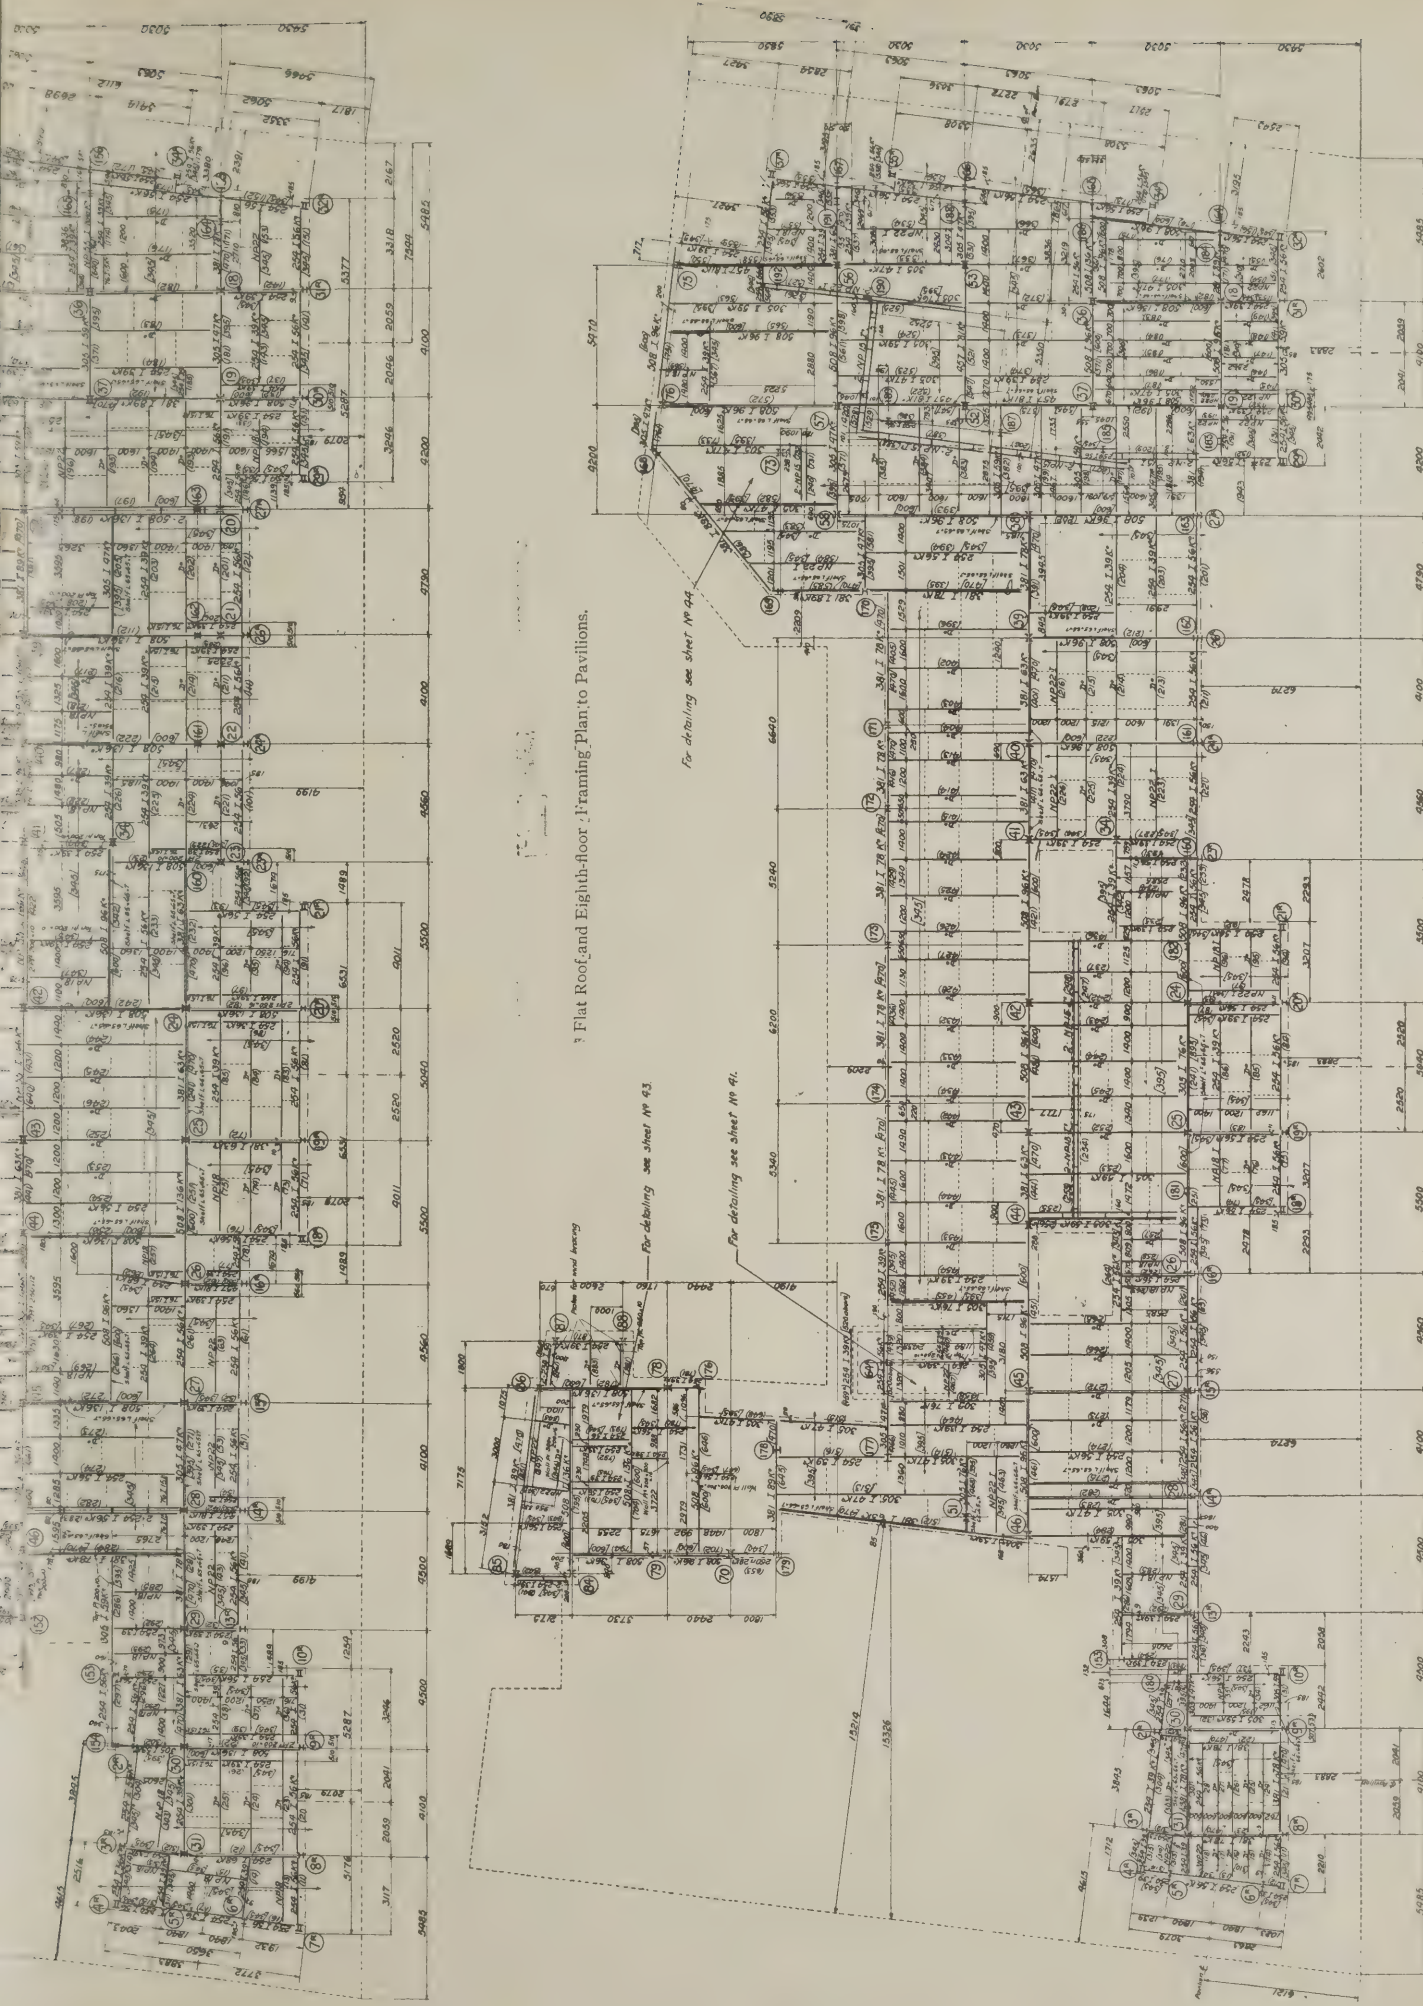

Sixth-floor Framing Plan

Seventh-floor Framing Plan

Figures in brackets thus [] denote the distance from finished floor level to bottom flange of beam. Figures in circles thus () denote numbers of columns. Figures in circles thus O denote numbers of columns.

THE RITZ HOTEL.

IN continuation of the series of steelwork plans of the Ritz Hotel (now approaching completion in Piccadilly, London) which we have published in previous issues, we now give the fifth, sixth, seventh and eighth-floor framing plans. The steelwork framing plan for the fourth floor was published in our issue for January 10th last, while that of the third floor was published in our issue for September 13th, 1905. The general principles and indications on the drawings have been explained in connection with other framing plans of the hotel published in our pages (see our issue for March 22nd, 1905).

The Fifth-floor Plan.

As regards the fifth-floor framing plan on p. 207 of this issue, the connections and dimensions are the same as on the lower floors. The exterior walls are set back at the fifth-floor level to Piccadilly, Arlington Street and Hyde Park, necessitating heavy cross girders at this floor, particularly at the corners. The problem of carrying the set-back wall was rather difficult, as no girders were allowed to project below the ceiling, and beams not more than 10 in. deep could be used, except beams which were placed in walls; for instance, the girder between columns 2 and 31 consists of three 10 in. beams with plates on top and bottom. The portion of the building next to Arlington Street is set back more than for the Piccadilly side. The girder between columns 32 and 48A has previously been described, and the arrangement for bracing the said girders laterally and forming the connection between the column and the girder was then described. It should be noticed that the strut 48B carrying the pavilion above rests on two 22 in. beams with two plates on top and bottom. These two plates are connected with the side connection angles to the plate girder G75, and there is also provided an angle with stiffeners. The setting-back of the wall is illustrated on the spandrel section on the upper left-hand corner marked "section between columns 5 and 6."

The Sixth-floor Plan.

On the sixth floor two beams are provided all around the front in order to carry the sloping roof. All the exterior struts stop at this level.

The Seventh-floor Plan.

The seventh floor starts at intersections of the sloping roof of the seventh-floor plan, and the different dimensions on this plan are given to the intersection points at the seventh-floors level. At the corner of each pavilion sloping hip rafters were used; for the centre pavilion they are marked 18R and 21R. The loads of the seventh, eighth and ninth floors are partly carried on these hip struts or hip rafters; and in order to take up the horizontal component, diagonal bracing was introduced between the columns and the rafters. At the back of the building, to the area, the roof starts at the seventh-floor level, and struts are placed on the cross-girders to carry the eighth floor and part of the roof.

The Eighth-floor Plan.

Portion of the eighth floor constitutes a flat roof. In the pavilion between Arlington Street and Piccadilly a water tank is placed; the beams in this floor served to carry that water tank. The same is the case with the pavilion between Green Park and Piccadilly.

Obituary.

Mr. W. H. Hopkinson, A.M.I.C.E., engineer, surveyor of highways, and inspector of buildings to the Keighley Corporation, died last week. He was about 50 years of age. His principal works under the Keighley Corporation were the construction

of the Marley sewage-disposal works at a cost of about £30,000; filter-beds in connection with the waterworks at Oldfield at a cost of about £20,000; and latterly the laying of the permanent way for the electric tramways.

Mr. John Caton, builder and joiner, of Blackburn, died recently, aged 66.

Mr. John Hammond, senior partner in the firm of J. Hammond & Sons, joiners, builders and contractors, of Bradford, died last week, aged 67.

Mr. V. D. de Michele, died at Rochester recently, in his fifty-eighth year. He was a well-known authority on cement.

Notes and News.

A Big Job.—The work of erecting a new station at Pontypridd has been commenced by the Taff Vale Railway Co. It is estimated that the new buildings and extensions will cost about £150,000.

Change of Address.—Mr. William F. May, architect and surveyor, has changed his address from 4, Featherstone Buildings, High Holborn, to 20, Newington Green, London, N. His new telephone number will be 2,279 Dalston.

Cardiff Town Hall.—At a recent meeting of the Cardiff Town Hall Committee it was stated that up to date the following payments had been made:—Contractors, £230,000; architects' commission, £11,438, and out-of-pocket expenses, £404; salary of clerk of works, £2,255.

Another Cottage Exhibition.—Newcastle is to have a model cottage exhibition in 1907, somewhat on the lines of the one at Letchworth (Garden City); but "freak" cottages and those which are not suitable for the Northern district will be strictly excluded.

The French Chamber of Deputies is to be altered under the direction of M. Nenot. According to his design the whole of the present Chamber will be demolished, and in two years a new and much larger Chamber will be built. The cost will be about £420,000, including the expense of a temporary chamber. Although the existing Corinthian columns will have to be taken down, it appears that they will be re-erected and will form part of a front not unlike that of the Grand Palais.

The new Vauxhall Bridge.—A model of a span of the new Vauxhall Bridge was exhibited at the London County Council meeting last week. The Improvements Committee recommended that granite pylons should be erected at both approaches to the bridge, and that an agreement should be made with Mr. Alfred Drury, A.R.A., for the modelling and casting, at a total cost of £2,800, of four groups of statuary, to be placed on the pylons, and that Mr. Bertram Pegram be associated with Mr. Drury in the case of two of the groups. The matter was postponed.

The Teak Trade.—Messrs. Denny, Mott & Dickson, Ltd., report that the landings of teak in the London docks during March consisted of 203 loads of logs and 279 loads of planks and scantlings, or a total of 482 loads, as against 474 loads for the corresponding month of last year. The deliveries into consumption were 480 loads of logs and 505 loads of planks and scantlings, together 985 loads, as against 1,140 loads for March, 1905. The figures sufficiently indicate the "dragging" condition of the market. In face of the difficulties in securing sufficient supplies holders have no reason to force sales, whilst consumers hold on tenaciously to the last moment before paying prices which they reasonably deem to be unnaturally high.

Glasgow Technical College Architectural Craftsmen's Society.—Mr. George Herbertson has been elected president for the current year, Mr. A. L. Currie and Mr. J. C. Reid vice-presidents, Mr. John Wilson and Mr. James Flett secretaries, Mr. A. Scott treasurer, and a committee of fifteen members.

Building Trade Bad in South Africa.—The April circular of the Emigrants' Information Office, 31, Broadway, Westminster, states that there is no improvement in the building trade in Cape Colony. Building trade employees are specially warned not to go to the Cape at the present time in search of work; and the same warning applies to Natal, the Transvaal and the Orange River Colony.

A Deputation from the Further Strand Improvement Committee in support of their memorial is to be received by the Improvements Committee of the London County Council on May 2nd. Until its presentation on that date the memorial may be signed at the Royal Academy of Arts, Burlington House; the Surveyors' Institution, 12, Great George Street; the Society of Architects, Staple Inn Buildings; or at the office of the honorary secretary, 7, Pall Mall. The Surveyors' Institution have subscribed £5 5s. towards the expenses of the committee.

York Architectural Society.—At the last meeting of this Society, held on April 5th, a paper on "English Architecture in Later Stuart Times" was read by Mr. C. F. Innocent, A.R.I.B.A., of Sheffield. The period under consideration was from the restoration of the monarchy in 1660 to the death of Queen Anne in 1714, a period lasting little more than half a century, but one of the greatest interest to the student of English architecture, for not only was an immense amount of building done but during this time the designers emancipated architecture from the crudity of Jacobean design. The architecture was marked by great restraint in design, a restraint which remained in the smaller buildings throughout the eighteenth century, but in the larger buildings was swept away by the exaggerated Palladianism of the Earl of Burlington and his followers. The sanity and practical common-sense which mark so many of the designs of the time was largely due to the influence of Wren, who continued in the practice of his art until the eighty-eighth year of his age.

Fatal Crane Accident at the Piccadilly Hotel.—Mr. John Troutbeck recently held an inquest at Westminster on the body of a ganger named William Smith, who died as the result of injuries received while working on the Piccadilly Hotel, on the site of St. James's Hall. It appeared that in the course of excavation on the site on November 3rd last a loaded skip was being lifted by a crane when, owing to the wet state of the leather on the brake, it failed to grip, and the skip caught the deceased man on the shoulder, knocking him on to a strut and pinning him there. He was removed to hospital, where it was found that he had received an injury to the spine. Paralysis and other complications set in, and he died on April 4th. The foreman said it was left to the discretion of crane-drivers to place a covering over their brakes. The Coroner: What material is supplied to them for covering?—Witness: None, sir; they can find a bit of sacking.—The Coroner: Do you suggest sacking is waterproof?—Witness: Well, rain won't go through it in five minutes.—The Coroner: We have not yet got to a five minutes' working day.—Answering a Home Office inspector, the foreman said he had full control over the crane-driver, but did not instruct him previous to the accident to place a covering over the brake.—A verdict of "Accidental death" was returned, and the jury added a rider expressing the opinion that the contractors had shown gross neglect in the management of their cranes.

Enquiries Answered.

The querist's name and address must always be given, not necessarily for publication.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Correspondents are particularly requested to be as brief as possible.

Concrete Piers and Arches in Foundations.

KENSINGTON.—D. M. C. writes: "One wall of a proposed building is to come at the back of a tidal river wall. The subsoil is silt on gravel. It is proposed to carry the wall on concrete piers resting on the gravel, the piers getting practically no lateral support. The concrete would be composed of 1 part of Portland cement to 6 parts of ballast. Kindly give a convenient working formula for determining the section of a pier; the ratio of height to width being not more than 12 to 1. What would be a safe load to put on the gravel? To connect such piers a certain text-book on foundations mentions concrete arches. Are such 'arches' used in modern work? Is there any method of determining the necessary depth of such 'arches' in relation to the span? Which is the best way to connect such concrete piers?"

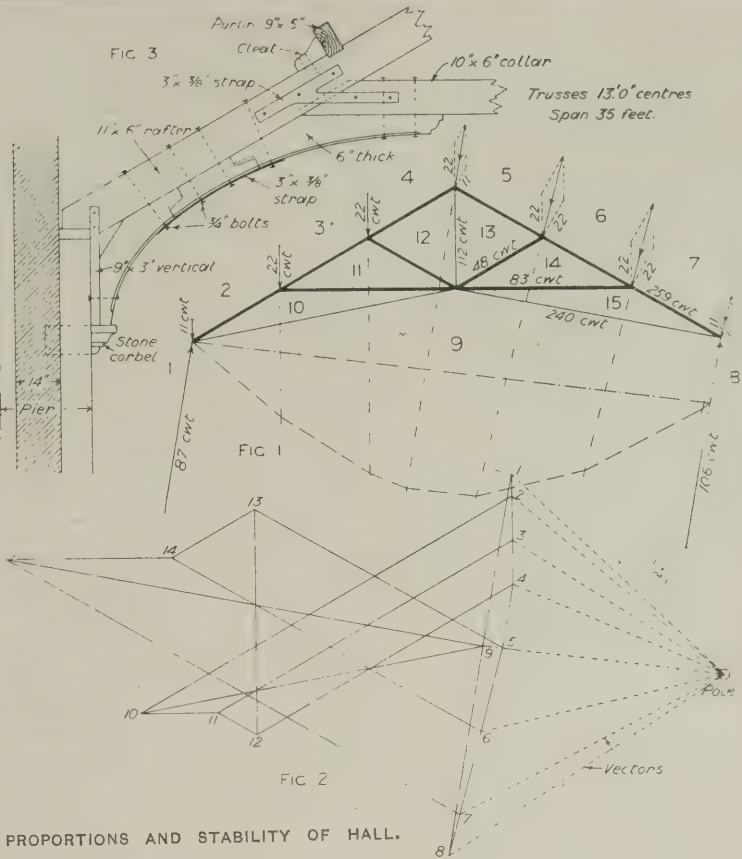

The crushing load on 6 to 1 concrete twelve months' old may be taken at 67 tons per sq. ft., and the safe working load at, say, 5 tons per sq. ft., as a maximum on a pier 12 diameters high, including its own weight. The safe load upon deep gravel is somewhat difficult to estimate without a knowledge of the site, but it is possible that it may withstand as much as the concrete above described. Concrete "arches" are a comparatively modern method of bridging from pier to pier in foundations. Although they do not act strictly as arches, the thickness at crown may be calculated as for an arch $T = \frac{WL}{8r}$,

where T = thrust in tons at crown of arch, W = total load in tons on foundations from pier to pier, L = span from pier to pier in feet, r = rise of arch in feet. The thickness of the arch at the crown must be such that the maximum intensity of stress does not exceed the safe load, say 6 tons per sq. ft. The so-called "arches" connect the concrete piers together, and the whole weight of the building, including the concrete, must be divided up over the piers in ascertaining the load upon them. HENRY ADAMS.

Building Lines.

MANCHESTER.—CONSTANT READER writes: "A building abuts on a street and is old property. B, next to it, is set back 6ft. and is modern property, being about seven years old. C, next to B, but divided from it by a street (cul-de-sac), is 18ft. back from the main street, and is old property. D, next to C, is set back 2½ft. from C, and is also old property. The owner of C desires to bring his building forward to the front main wall of B, and is willing to give a narrow strip at the front to the authorities free of cost. Have the authorities any power to prevent C from coming forward as proposed? Does not the modern building B constitute a new building line?"

The building line must have regard both to B's property and also that of D, and C cannot legally bring forward his building in advance of that of D. The Act says "on either side." F. S. I.

PROPORTIONS AND STABILITY OF HALL.

Proportions and Stability of Hall.

BIRMINGHAM.—SOUND writes: "Enclosed is a rough tracing (not reproduced) of proposed building. I should be greatly obliged if you would express your opinion upon the following three points:—(1) Acoustic properties of hall—is it sufficiently lofty? (2) Stability of piers 1, 2, 3 and A—could these be reduced? (3) Would it be safe to put angle blocks in roof trusses B, and remove the tie rods which will be unsightly?"

Without particulars of the materials to be used for the bounding surfaces of the hall we cannot determine the acoustical properties exactly. The height of the hall appears to be rather small for the length and width, especially as the girders carrying the floor above project nearly a foot below the ceiling. It would probably improve both the acoustic properties of the hall and the appearance if the height were increased to 20ft. The girders carrying the weight of floors over hall and having spans of 35ft appear from the rough sketch to be either 17ins. or 18ins. deep; they should be British Standard Beam No. 30 (B.S.B. 30) 24in. by 7½in. by 100 lb. rolled joist section. The piers as shown will each have a sectional area of about 6 sq. ft., and as the load on each at level of hall floor will be about 30 tons, or say 5 tons per sq. ft., they will be sufficient to carry the load, but not sufficient to withstand the bending moment due to the wind and the spreading of roof at foot of principal rafters, and at least another gin. projection on each would be desirable. This addition would be essential if the tie rods in roof were dispensed with. The roof truss shown by querist is incomplete, and should be arranged with struts as in accompanying frame diagram Fig. 1. Fig. 2 shows the corresponding stress diagram allowing a vertical dead load of 28 lbs. per ft. super, and a wind-pressure on one side normal to the slope of roof of 28 lbs. per ft. super. The maximum stresses have been scaled and are marked on frame diagram. The proposed 17ins. by 4½ins. principal rafters will not be sufficient. If the sloping tie rods are put in the principal rafter should not be less than 11ins. by 6ins.,

and the whole truss should then be made 6ins. thick. An angle block as suggested would not be sufficient, but curved ribs as in Fig. 3 may be put in instead of the tie rods. HENRY ADAMS.

Red Ants in Basement.

TUNBRIDGE WELLS.—ADON writes: "A house in this town is infested with red ants in the basement. How can they be destroyed; or, if this is not possible, what is the best way to protect food and stores from them?" See p. 183 of our issue for October 25th, 1899.

Books.

MANCHESTER.—ANXIOUS writes: "I am preparing for the City and Guilds brickwork examination and the Board of Education building construction examination. Kindly name two good books on the above subjects to assist me a little. Also, is it possible to obtain last year's examination papers on these subjects, and from whom?" "Bricklaying and Brickcutting," by H. W. Richards (price 3s. 6d.) and Professor Adams's and Mitchell's books on "Building Construction" (price 8s. and 8s. 6d. respectively). The prices stated are post free from our offices. The City and Guilds Examination papers are given in the report on the work of the Department of Technology published each year by Mr. John Murray, of Albemarle Street, W., price 9s. nett. The South Kensington examination papers are published by Messrs. Eyre and Spottiswoode, East Harding Street, E.C.

COLWYN BAY.—SEASIDE writes: "Is there any book that deals with the planning and internal accommodation of a biscuit factory? Also, please name a book upon salt-water swimming-baths (with details if possible)." We do not know of a book dealing with biscuit factories. As regards books, we can only suggest R. O. Allsop's "Public Baths and Washhouses" (price 6s. post free from our offices).

Warehouses and Rights of Light.

TRISKELE writes: "The accompanying drawing (not reproduced) shows two old warehouses adjacent to each other, one a building of several floors and the other of one-storey with a roof light on the side facing the tall building; also a new one-storey building adjoining the old one-storey building, with a similar roof light. (1) Will the roof light of the new building be considered an ancient light in twenty years' time, and so prevent my client from building his smaller warehouse higher? (2) In regard to my client's two old buildings only, if the smaller building were sold without any agreement being made about light, how high could the new owner build the smaller warehouse in relation to the larger (both being more than twenty years' old)?"

(1) Yes; the fact that it is in a sloping and not in an upright position makes no difference (save, of course, in degree). (2) I do not think the smaller building could be raised at all. Would not even a slight rise cause a considerable diminution of light to the lowest windows of the larger building? Your drawing has no measurements given, nor any scale marked upon it. F. S. I.

Chimney Construction.

BRADFORD.—J. B. writes: I am contemplating building a circular brick chimney between 60ft. and 80ft. high, to take the smoke from a foundry cupola. The flue will be about 2ft. 6ins. in diameter, and will enter the chimney about 20ft. from the ground-level. The foundation is on good level rock. Kindly give me a sketch of this. I should also be glad to have your advice in regard to making a flue-opening so high from the base of the chimney. Is a square base necessary for this?"

See an article on "Chimney Construction," by Mr. J. Kennedy, in "Specification No. 9," price 2s. 6d. (or 3s. 3d. post free from our offices). There is nothing against one flue entering higher up in the shaft. A square base is not at all necessary. See the working drawing of the chimneys at the Chelsea Generating Station, published in our issue for February 15th, 1905.

White Patches on Wallpaper.

LIVERPOOL.—H. writes: "Which is the best way to prevent white patches appearing on wallpaper? They are on inner walls, and cannot be through any damp. The house is comparatively new, having only been built about two years. When I entered I had all the papering stripped off the walls, and where I noticed white patches I had pitch paper put on the walls, but this has in most cases been ineffectual. Is there anything the walls could be coated with before re-papering?"

The trouble is evidently due to the lime in the new plaster affecting the colours in the paper. We suggest painting the walls before papering with "Rubberose," a damp-resisting paint supplied by Messrs. John Line & Sons, of Alfred Place, Tottenham Court Road, London.

Architectural Draughtsmen at the War Office and Admiralty.

EALING.—ENQUIRER writes: "Kindly inform me as to vacancies for architectural draughtsmen at the Admiralty or War Office. I have an uncle who is an admiral in the Navy. Would his recommendation give me an entrance as draughtsman? The Office of Works is, I believe, also difficult to enter. I suppose I should have to compete with others, in the usual way, for an entry into the Admiralty?"

Examinations are held for posts on the regular staff. Applications for positions on the temporary staff should be made to the Director of Works, H.M. Admiralty,

Northumberland Avenue, London, W.C. Recommendations from relatives are useless; competency is the only essential.

Fee for Valuation.

LIVERPOOL.—DILAPIDATIONS writes: "A client let some property on lease, with power to make structural alterations conditional upon restoring to original condition upon the expiry of the said lease. The same has now expired, a question of cost has arisen, and I have been called in to make a valuation, which I set at about £600. What is a reasonable fee for this?"

This entirely depends on circumstances. The usual fee for a complete survey of dilapidations—when made by a properly-qualified person—is 5 per cent. upon the first £500 and 2½ per cent. on the remainder. This includes the survey of premises, measuring work, making estimate of cost, preparing schedule, negotiating for the settlement, and final settlement for lump sum. For merely measuring and estimating, including full bill of particulars, 2½ per cent. will be ample. (See "Specification" No. 6, p. 14.)

F. S. I.

Radius of Gyration.

EASTBOURNE.—C. D. H. writes: "What is the meaning of 'radius of gyration' as to strength of steel columns and stanchions? In a table I find the following: Steel column: 6in. diameter, 98 lbs.-ft., sectional area 28.27 sq. ins., will carry a safe dead load of 85 tons 10ft. high (flat ends) and giving 'radius of gyration' at 1.5ins. Would 'radius of gyration' also apply to cast-iron columns?"

See p. 331 of our issue for July 15th, 1903.

Casement Windows.

KINGSBRIDGE.—LOTUS writes: "Kindly give a satisfactory section for the sill and jamb of a casement window opening out-

addition of a beading as for No. 1 and No. 3 be of use to stop this? No. 3 is an imaginary section with metal tongue fitting close into the lower rail of the casement sash and with a high beading on top of the sill. Would this section be in any way preferable to the others?"

It is extremely difficult to ensure that a casement window shall be watertight in an exposed position, but the cross-section with which I have been most successful is shown in the sections below. The difficulty in all

such cases is to prevent the ingress of water by suction when a high wind blows rain-water closely against the joints. The beading you show would not prove successful in this respect. F. S. I.

Diversion of Sewer.

BURNHAM.—W. J. P. writes: "My client has purchased a piece of land situated in the centre of a town and recently used as a builder's yard. He proposes to build on the cleared site, plans for which have been submitted to the urban district council, who have approved and passed them subject to the diversion of a main public sewer which passes through the property in a diagonal line. My client is anxious to know if he is legally liable to comply with the Council's requirements, which are to be carried out at his expense.

Under the Public Health Act, 1875, s. 26, it is forbidden to build over any sewer of the urban authority. You do not state on what terms the Council obtained their right of easement across this land, or if the site was acquired by the owner with this easement existing. Take legal advice.

Wooden Houses in Gardens.

B. S. J. writes: "I have to erect a wood building on some leasehold property, and propose bolting the sill down to a new dwarf brick wall. Can the lessees (my clients) legally remove this building on the expiration of their tenancy, or would the fact of the woodwork being secured to the brickwork, which will be started on concrete below the ground-level, prevent them doing so?"

You will be perfectly safe in bolting down your wooden building, as you suggest, and before the termination of their lease your clients may remove the building as an ordinary fixture. You should, however, enquire whether the lease allows of the erection of such a building as you propose—there may be some prohibitive clause in that document. F. S. I.

wards on a very exposed position. I have not come across a really satisfactory one. Section No. 2 on the accompanying drawing has proved leaky in actual work, water bubbling up in a high wind. Would the

Tenders.

Barnard Castle.—Accepted for the erection of new business premises, for the Co-operative Society. Mr. T. Farrow, architect, 7, Market Place, Barnard Castle. Quantities by architect:—

Excavator, bricklayer and mason—R. Wilson.
Carpenter and joiner—G. P. Robinson.
Slater—J. Lancaster.
Plumber and glazier—C. E. Raine.
Plasterer—F. Welford.
Painter—G. P. Robinson.
[Twenty-five tenders received.] [All of Barnard Castle.] Contract about £1,100, which does not include shop fronts or interior fittings.

Bexley.—For the erection of a new Council school at Bexley, East Wickham, for the Kent Education Committee. Mr. Wilfrid H. Robinson, surveyor to the committee:—

F. Spencer & Sons	£4,223	10	0
H. Kent	4,145	0	0
Enness Brothers	4,090	0	0
J. Ellingham & Sons	3,963	2	10

London, N.E.—For the erection of new timber sheds at Kingsland, for Messrs. Kennedy Brothers. Mr. W. Stone, architect:—

J. McManus	£3,631
Turner & Hudson	3,613
J. Haydon & Son	3,440
Jarvis & Son	3,438
Hill & Smith	3,355
W. Shurmur & Sons	3,339

(Continued on p. xv.)

£100

IN PRIZES.

The great want of the Architectural and Decorating professions is a Color Standard. The work of both Architects and Decorators would be vastly simplified by universal adherence to an agreed upon Color Card—the Painter could order with the certain knowledge of getting exactly the shade of color required—the Architect could specify colors with complete assurance that his ideas would be carried out to the letter—and Decorators' Customers could give their orders in a definite and unmistakable manner.

There is, however, no set of colors upon which all can agree—and the obvious remedy is to construct a Color Card upon the votes of the majority—such Color Card whilst satisfying the individual idea would also represent the opinion of the body of Architects and Decorators.

We, therefore, ask your assistance in getting the opinion of the majority, and as an inducement offer the above prizes. All you have to do is to select one shade from 4 variations of the same color name (which we supply) and so build up a Shade Card of 60 Colors.

Fill up this Coupon with all particulars and post to:—

HALL'S SANITARY WASHABLE DISTEMPER

The Refinement of Good Taste in Wall Decoration

is shewn in the choice of Hall's Sanitary Washable Distemper. This is a wall covering that is at once artistic, practical, and economical.

Its practical advantages are simplicity, durability, and cheapness. Only water is required to be added to make Hall's Distemper ready for use. It is unaffected by light, heat, or damp, does not crack or peel off, and is washable.

It is made in 73 colours, including rich dark as well as light shades; in actual cost it is cheaper than wall paper or flatted paint, and being applied with a whitewash brush represents a further great saving in labour.

"Sisco" White Japan is the correct material for painting Doors, Picture Rails, and all woodwork of rooms decorated with Hall's Distemper. "Sisco" Japan is a pure white decorator's enamel, which dries with a hard, smooth, lustrous surface. It lasts for many years with beauty unimpaired.

"Modern Development in House Decoration," a beautiful booklet with coloured views of Drawing, Dining, Bedroom, and Library, sent post free on application (with samples and shade-card of Hall's Distemper if specially requested), from the sole manufacturers,

NOTES ON COMPETITIONS.

Bolton Council School.

A somewhat similar state of affairs has transpired at Bolton to that which befell Colchester a few weeks ago as commented upon in *THE BUILDERS' JOURNAL* of March 23rd. In this instance, as in the former, the services of a professional assessor were dispensed with and letters were received from unsuccessful competitors protesting that the selected design did not comply with the conditions and that all the plans should be submitted to a professional assessor. The Town Council had advertised a competition for a school at a cost of £10 per scholar, and had stipulated in clause 3 of the conditions as follows: "The cost of the building will be an important element in determining the competition, and if, after the working drawings and specification are prepared for the selected designs, no tender can be obtained from a responsible builder to complete the work within 5 per cent. of £10 per head—the committee shall be at liberty to discard any such design, and return it to the author, to employ any other architect that they may think proper, and they shall not be bound to remunerate the author of the discarded design in any way. The committee reserve to themselves the right, before deciding on the designs, to require any architect to obtain a provisional tender from some respectable firm of builders in support of the estimated cost submitted by such architect." This is a most unsatisfactory condition, especially as regards the last clause, but one, unfortunately, which too often finds a place in particulars of competitions. The only way to obtain a reliable estimate from a builder is to supply him with complete bills of quantities; to expect him to prepare an estimate in any other way is to expect something which could be better done by the architect alone or in consultation with his quantity surveyor. If the committee have availed themselves of this clause the fallacy of the proceeding has been proved by the result, for the lowest tender has come out at £11,418, or about 50 per cent. in excess of the stipulated sum. Had an assessor, one skilled in designing and erecting schools, been employed, the dilemma which the Town Council now finds itself in would have been avoided, for it has been decided in council to rescind the confirmation of the minutes of a previous meeting in so far as they refer to the acceptance of the tender and to the adoption of the selected design. It was admitted by the mayor, who, by the bye, supported the minutes, that the Council were "liable for something," and the inference is that that something is fees for the work entailed before tenders could be obtained. On the usual basis the amount of such fees would have paid an assessor and left a considerable sum over, so the ratepayers, as usual, will have to bear the brunt of the shortsightedness of their representatives. As regards the proposed cost of the schools, £10 per head is little enough, although that sum has sufficed in instances on record: £15 per head is most excessive unless the requirements were extraordinary, in which case the assistance of an assessor upon the conditions before they were issued would have been invaluable, as it always should be at this stage in any case. What the Council now propose to do is not clear. Their best course would be to submit all the plans received in competition to an expert, in order that he might select the best scheme which complies nearest with the conditions and advise how the cost might be reduced if he considers that the requirements as stated in the conditions are in excess of the value of £10 per scholar. Should the assessor's selection ratify the Council's action in throwing over the scheme chosen by their

Education Committee, then the authors of that scheme must be adequately compensated for the trouble they have been put to. It is nearly always inadvisable to take part in a competition where the estimated cost is inadequate, but having decided to do so it would surely be as well if competitors frankly stated the fact in their reports and offered such suggestions as might be expedient towards the simplifying of the requirements.

Elementary School, Barnsley.

In the competition for a new elementary school to be erected in Racecommon Road, Barnsley, the assessor, Mr. Braithwaite, of Leeds, has awarded first place to the design of Mr. E. W. Dyson, C.E., of Barnsley, whose design has been accepted. The building will cost from £10,000 to £11,000.

An American Competition.

The designs of Messrs. Barnett, Haynes & Barnett, of St. Louis, have been selected, in competition, for the new Roman Catholic cathedral to be built at St. Louis, Miss.

A South African Competition.

The town council of Krugersdorp have under consideration the erection of a town hall and municipal offices, and the Works Committee suggest that local architects be asked to submit designs for a building costing £10,000, premiums of £50 and £25 being offered.

The following is a list of competitions open:—

DATE OF DELIVERY.		COMPETITION.
May	5	BRANCH LIBRARY AT SUNDERLAND.—Limited to local architects. Premiums of £20 and £10. Particulars from Mr. John W. Moncur Borough Engineer, Town Hall, Sunderland.
"	31	NATIONAL CONGRESS HALL FOR BRAZIL.—Premiums of 15,000, 10,000 and 5,000 milreis (equivalent to about £1,685, £1,125 and £562 respectively). 5,000 milreis also for designs not premiated but desirable to be acquired. The conditions of the competition can be seen at the offices of the Commercial Intelligence Branch of the Board of Trade at 73, Basinghall Street, E.C.
No date		DETACHED AND SEMI-DETACHED HOUSES AT CLIFTONVILLE, BELFAST.—Premiums £700. Particulars from R. J. McCunnell & Co., 51, Royal Avenue, Belfast.

Views and Reviews.

Modern Sewage-disposal.

The publication of a handbook on sewage-disposal for the use of the layman is a matter of congratulation. If the aspiring councillor can be made to realize the limitations of his intelligence in questions like these, which exercise even the trained intellects whose duty it is to deal with them, municipal engineers will have reason to bless Mr. Lemmoin-Cannon many times a day. The author sets forth the various modern methods and processes of dealing with sewage, without bias in favour of any particular system, and the book should have a wide sale.

"Modern Sewage-disposal." A popular handbook. By H. Lemmoin-Cannon. London: Henry J. Drane, Salisbury House, Salisbury Square, E.C., price 1s. nett.

Modern School Buildings.

The value of Mr. Clay's great work is more than borne out by the speedy appearance of a second edition. The first part of the book, dealing with secondary schools, has been little altered beyond the excision of a certain amount of "somewhat irrelevant matter" and the insertion in its place of a chapter on fire-protection and rather fuller treatment of training colleges, pupil teachers' centres, cost of school buildings, &c. The second part, on elementary schools, has been practically re-written, particular attention being given to the subject of planning small and medium-sized country schools. Special

chapters have also been added upon infant schools, manual training and cooking centres, temporary buildings, the alteration and adaptation of old buildings, as well as a comparative survey, fully illustrated, of the systems of school planning on the Continent and in America. There is also an addition to the plans, &c., of recently-erected schools. The question of school architecture is a very pressing one, and the preparation of such an exhaustive work must have been trying in the extreme. Mr. Clay's book remains the text book on this important subject.

"Modern School Buildings," by Felix Clay, B.A., 2nd edition, revised and enlarged. London: B. T. Batsford, 94, High Holborn, W.C., price 25s. nett.

THE PRACTICAL EXEMPLAR OF ARCHITECTURE.

UNDER this title a new permanent feature commences in the current issue of "The Architectural Review" which should prove of great interest and utility to architects who desire to study fine examples of architectural detail. Each month a number of details will be illustrated by photographs and measured drawings, so that all the essential features can be readily grasped. The series will embrace details of every description—doors, windows, ceilings, chimney-pieces, gates, railings, roofs, staircases, balustrades, chimney stacks, cornices, dormers, gable ends, &c. Each instalment will deal with one kind of detail only. The first article is devoted to gate piers, the celebrated piers at Hampstead Marshall being the examples given. The details will be of both old and new work, and are selected by the Editor, Mr. Mervyn E. Macartney, F.R.I.B.A. Architects who have photographs or measured drawings of good details might communicate, to their advantage, with the Editorial Secretary. The details must be of buildings in the United Kingdom.

Trade and Craft.

A Useful Prize Competition.

We are glad to note that another attempt is being made to solve the great difficulty of a fixed standard of colour. Every practising architect must at some time or other have experienced the difficulty of describing the precise shades of colour required in a scheme of decoration. Attempts have been made before, but not on such practical lines as the present. Messrs. Pinchin, Johnson & Co., of Billiter Street, the well-known manufacturers of "Satinette Enamel," have determined to seek the assistance of the general body of architects, surveyors, &c., to fix a standard of colour which shall be at the disposal of the whole trade. In order to encourage everyone to assist in this work, Messrs. Pinchin, Johnson have instituted a competition in which they are offering £100 in prizes to the competitors who succeed in making the nearest forecast of the standard fixed upon by the majority. This competition is open to practically all our readers, and all that intending competitors have to do is to cut out the coupon which appears on the advertisement page xi and send it to Messrs. Pinchin, Johnson, who will then forward the necessary colour slips and general instructions for this competition, which deserves to be a success, for the scheme shows much enterprise and public spirit on the part of the firm in question.

The Devon and Exeter Architectural Society held its nineteenth annual meeting at Tiverton on April 7th, when the retiring president, Mr. B. Priestley Shires, F.R.I.B.A., delivered an address. The new president is Mr. Harbottle Reed, while Mr. M. A. Bazeley is vice-president, and Mr. Allan J. Pinn, A.R.I.B.A., hon. secretary.

Complete List of Contracts Open.

With a few exceptions, news of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issue of other contracts that still remain open.

Unless expressly stated to the contrary all deposits required for bills of quantities, &c., are returned on receipt of bona-fide tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair-wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

April 18. London, S.E.—Supply of Fletton bricks for the year ending Mar. 31, 1907, the estimated quantity being 80,000. Forms of tender and other particulars can be obtained on application to the Town Clerk. Tenders, addressed to the Town Clerk and endorsed "Tender for Bricks," must be delivered to the Town Hall, Spa Road, not later than 4 p.m. on April 18.

April 19. Marlow.—Alterations and additions to the music-room, for the Marlow Public Hall, Ltd. Plans and specification may be seen at the office of R. Wellcome, 5, High Street, Marlow. Tenders (endorsed) to be delivered at the office of the Company, 5, High Street, Marlow, not later than 5 p.m. on April 19.

April 19. Blaydon.—Enlargement of the Galvanized Iron Isolation Hospital at Normans Riding, comprising the erection of administrative, laundry and discharging blocks and two pavilions, for the Blaydon, Ryton and Whickham Joint Hospital Committee. Plans and specifications may be seen and form of tender obtained on application to J. B. Renton, Council Offices, Whickham, R.S.O. (who will attend at the Council Offices, Whickham, by appointment, to supply all particulars) upon payment of £1. Sealed tenders, endorsed "Tender for Hospital," must be delivered to Henry Dalton, clerk, Blaydon-on-Tyne, by noon on April 19.

April 20. Cross Keys.—Twenty-five (more or less) houses near Nine Mile Point Collieries, Sirhowy Valley. Plans and specifications may be seen with T. Thomas, Nine Mile Point Collieries, near Cross Keys, Mon., or at the office of R. L. Roberts, M.S.A., Abercarn. Sealed tenders, endorsed "Tenders for Houses," by April 20.

April 20. Drogheda.—Erection of an hospital, for the Drogheda Cottage Hospital Committee. Drawings and specifications may be inspected with the Hon. Secretaries, Greenhills, Drogheda, and copies obtained from Frederick Shaw, M.R.I.A.I., architect, St. Laurence Street, Drogheda. Sealed tenders to be sent to Sidney Smith, Rosa Smith, hon. secs., Greenhills, Drogheda, not later than April 20.

April 20. Swansea.—New administrative block at the Isolation Hospital, Garragech, near Forestfach, for the R.D.C. Plans, specifications and conditions of contract may be inspected on application to T. Trevor Williams, surveyor, at the Council Offices, Alexandra Road, Swansea. Bills of quantities and forms of tender may be obtained from the surveyor on payment of the sum of £3 3s. Tenders, sealed and endorsed "Administrative Block," to be sent to Edward Harris, clerk, the Council Offices, Alexandra Road, Swansea, on or before April 20.

April 20. Swansea.—Laying and construction of foundations for intended Small Pox Hospital at Garragech, near Forestfach, for the R.D.C. Plans, specifications and conditions of contract may be inspected on application to T. Trevor Williams, surveyor, at the Council Offices, Alexandra Road, Swansea. Tenders, endorsed "Foundations for Small Pox Hospital," to be sent to Edward Harris, clerk, the Council Offices, Alexandra Road, Swansea, on or before April 20.

April 20. Cothal.—Mason, carpenter, slater, and plasterer works of new dwelling-house and shop to be erected at Cothal; also for the mason and carpenter works of repairs and concrete floor at the old mill, Cothal. Plans and specifications may be seen in the hands of Alexander Stronach, junr., & Son, advocates, 29, Belmont Street, Aberdeen. Contractors will meet at Cothal on April 14 current, at 2 p.m., when the works will be pointed out by Mr. Stewart, architect, and offers must be lodged with A. Stronach, junr., & Son on or before April 20.

April 20. Wells-next-Sea.—Enlargement of school for the Norfolk Education Committee. Builders desirous of tendering can inspect plans and specification and obtain copies of quantities at the office of A. F. Scott, architect, Castle Meadow, Norwich, on and after April 5. A deposit of £1 is. will be required. Tenders must be delivered by noon on April 20, addressed to "The Secretary, Norfolk Education Committee, 57, London Street, Norwich," and endorsed "Tender for Wells-next-Sea School."

April 20. Tonbridge.—New Council school, to accommodate 420 children, at Tonbridge, Kent. The drawings and specification may be inspected at the office of the architect, C. H. Strange, A.R.I.B.A., 20, Dudley Road, Tunbridge Wells. Any person desiring to tender must send in his name to the architect, accompanied with a deposit of £1, not later than noon on April 5. The tenders, on the form supplied, to be delivered to N. R. Stone, 23, Church Road, Tunbridge Wells, not later than noon on April 20.

April 20. Hawkinge.—Enlargement to the Council school, at Hawkinge, near Folkestone, Kent. Drawings and specification may be inspected at the office of the architect, Andrew Brimley, Radnor Chambers, Folkestone. Any person desiring to tender, must send in his name to the architect, accompanied by a deposit of £1, not later than noon on April 5. Tenders, on the form supplied, to be delivered to W. Thomas, 66, Broadmead Road, Folkestone, not later than noon on April 20.

April 21. Kimbolton.—Erection of a laboratory at the Grammar School, at Kimbolton, St. Neots. For particulars apply to Wade, Gery & Brackenbury, St. Neots. Tenders to be in by April 21.

April 21. Hayle.—Erection and completion of house, for W. J. Easterbrook, according to plans and specification which may be seen at the residence of the Proprietor, Foundry Hill, Hayle, or at the office of Sampson Hill, architect, Green Lane, Redruth, from whom all particulars relating to the work may be obtained. Sealed endorsed tenders are to be sent to the Proprietor, on or before April 21.

April 21. Truro.—Erection and completion of farm buildings at Polmennor Farm, near Gwinear Road Station, according to plans and specification, copies of which may be seen at the Farm; also at the office of Sampson Hill, architect, Green Lane, Redruth, from whom all particulars relating to the work may be obtained. Sealed endorsed tenders are to be sent to F. E. Hamilton, the Estate Office, 53, Lemon Street, Truro, on or before April 21.

April 21. Llwynypia.—Alterations to Salem Chapel. Plans and specification to be seen with Jacob Rees, architect, Pentre, and tenders to be addressed to D. Jones, assistant overseer, Llwynypia, on or before noon, on April 21.

April 21. Forres.—Erection of a residence at Trafalgar Park. For the mason, carpenter, slater, plaster, plumber, painter and glazier, bell-hanger and blacksmith work. Plans and specifications may be seen with R. & R. Urquhart, solicitors, Forres, till April 20. Schedules of quantities may be obtained from Ross & Macbeth, architects, Inverness. Tenders to be lodged with R. & R. Urquhart on or before April 21.

April 21. Manchester.—Supply of terra-cotta for the Queen Street Municipal School. Plans may be seen and a copy of the bill of quantities (including specification) may be obtained at the Education Offices in Deansgate, Manchester, on a deposit of £1 is. Tenders, on the forms and in the envelopes provided, must be delivered at the Deansgate offices of the Education Committee not later than April 21.

April 21. Mold.—Alterations and extensions to the County School, Mold, Flintshire, North Wales. Plans and specifications may be seen at the offices of the architect, Samuel Evans, N. & S.W. Bank Buildings, High Street, Mold, from whom bills of quantities may be obtained on payment of a sum of £2 2s. Tenders to be made out on forms to be supplied, and sent in to W. R. Howard Evans, solicitor, Mold, clerk to the Governors, by April 21.

April 21. Swindon.—Alterations and additions to Sanford Street Council School, according to plans prepared by R. J. Beswick, 10, Victoria Road, Swindon, where the plans, general conditions and specification may be inspected. A copy of the bill of quantities and form of tender can be obtained from the Architect on payment of £1 is. Fair wages clause. Sealed tenders, on the prescribed form, endorsed "Alterations, Sanford Street Council School," and accompanied by priced (detail) bill of quantities under separate cover, to be delivered to Robert Hilton, town clerk, Town Hall, Swindon, by April 21.

April 22. Cork.—Extension of the chancel of the Church of the Holy Trinity, Father Matthew quay, in accordance with plans and specifications, which have been prepared by Ashlin & Coleman, architects, Dawson Street, Dublin, and which may be inspected at the office of James F. M. Mullen, M.R.I.A.I., architect, 30, South Mall, Cork. Sealed tenders to be lodged with the hon. secretaries, the Convent, Father Matthew quay, Cork, on or before April 22. Bills of quantities for the work are being issued by S. W. Morris, 68, Harcourt Street, Dublin, from whom they may be had, and intending contractors are requested to examine same before sending in their tenders, as the committee will not be responsible for their accuracy.

April 23. Coventry.—Nurses' home, for the Coventry and Warwickshire Hospital Committee, in accordance with plans and specifications prepared by the architects, A. Hessel Tiltman, F.R.I.B.A., 1, Raymond Buildings, Gray's Inn, London, W.C., and Herbert W. Chattaway, Trinity Churchyard, Coventry. Plans and specifications may be seen at the Architect's Office, Trinity Churchyard, Coventry, and bills of quantities and forms of tender can be obtained upon depositing the sum of £3 3s. Tenders, sealed and endorsed "Nurses' Home," to be sent to Ellis E. Crisp, secy., Coventry and Warwickshire Hospital, Stoney Stanton Road, Coventry, not later than 10 a.m. on April 23.

April 23. Eastbourne.—Additions to the Motor Omnibus House at Roselands. Plans and general conditions may be seen, and specification, bill of quantities, and form of tender obtained at the Borough Surveyor's Office, Town Hall, on payment of a deposit of £1 is. Tenders endorsed "Motor Omnibus House" to be sent to A. Ernest Prescott, borough surveyor, Town Hall, Eastbourne, not later than noon on April 23.

April 23. Truro.—Detached residence at Short Lanes End, Truro, for Thomas Powell, according to plans and specification which may be seen at the office of A. J. Cornelius, architect, Truro. Sealed tenders, endorsed, to be sent to Thomas Powell, Treyew Road, Truro, on or before April 23.

April 23. Truro.—Alterations and additions to "Trevaunance." Truro (now known as Comprigney House), for E. L. Carlyon, according to plans and specification, which may be seen at the office of A. J. Cornelius, architect, Truro. Sealed endorsed tenders to be sent to E. L. Carlyon, Truro, on or before April 23.

April 23. Sheffield.—Erection of a new sorting office at Attercliffe, Sheffield. Drawings, specifications and a copy of the conditions and form of contract may be seen on application to the Postmaster, at the Head Post Office, Sheffield, between the hours of 10 and 4. Bills of quantities and forms of tender may be obtained at H.M. Office of Works, Storey's Gate, London, S.W., on payment of £1 is. Tenders must be delivered before noon on April 23, addressed to the Secretary, H.M. Office of Works, &c., Storey's Gate, London, S.W., and endorsed "Tender for Sorting Office, Attercliffe, Sheffield."

April 23. Abertillery.—Erection of new Wesleyan church and alterations to present chapel. Plans and specifications may be inspected at 1, Commercial Street, Abertillery, and at the offices of the Architects, 41, High Street, Newport, from whom also copies of the quantities may be obtained on application. Tenders are to be sent to the secretary, Mr. G. D. Cattee, 1, Commercial Street, Abertillery, on or before April 23.

April 23. Cork.—Building and completing a gentleman's residence on the College Road, in accordance with plans and specification prepared by W. H. Hill & Son, architects, 28, South Mall, Cork, with whom tenders are to be lodged on or before April 23.

April 24. Dovercourt.—Two blocks of semi-detached residences. For particulars apply to H. S. Watling, architect, Kingsway House. Tenders to be in by April 24.

April 24. Manchester.—Excavation, &c., for marshalling sidings between Newton Heath and Moston, for the Lancashire and Yorkshire Railway. Plans can be seen and form of tender and specification obtained on application at the Engineer's Office, Hunt's Bank, Manchester. Tenders, endorsed "Tender for Excavation, &c., for marshalling sidings between Newton Heath and Moston," to be in the hands of R. C. Irwin, secy., Hunt's Bank, Manchester, by 10 a.m. on April 24.

April 24. Newton Abbot.—Erection of a drying closet adjoining the laundry at the workhouse, in accordance with plans and specifications, which may be seen at the office of Samuel Segar, F.I.A.S., Newton Abbot. Tenders to be marked "Tender," and sent to F. Horner, clerk to the Guardians, Newton Abbot, not later than April 24.

April 24. Ilford.—Erection of a junior mixed and infants' school for 630 children, together with latrines, playsheds, fencing, &c., on the Water Lane site, Ilford, Essex. Plans and specifications can be seen, and bills of quantities and forms of tender can be obtained at the office of the architect, Charles J. Dawson, 11, Cranbrook Road, Ilford, between the hours of 10 a.m. and 5 p.m., upon depositing £5 5s. Fair wages clause. Sealed tenders, endorsed "Tender for Water Lane Schools," are to be addressed and delivered to John W. Benton, Clerk to the Council, Town Hall, Ilford, Essex, by noon on April 24.

April 24. Boston.—New post office at Boston. Drawings, specifications and a copy of the conditions and form of contract may be seen on application to the Postmaster between 11 and 4. Bills of quantities and forms of tender may be obtained at H.M. Office of Works, Storey's Gate, S.W., on payment of £1 is. Tenders must be delivered before noon on April 24, addressed to the Secretary, H.M. Office of Works, &c., Storey's Gate, London, S.W., and endorsed "Tender for Boston Post Office."

April 25. Brimington.—Alterations and additions to the Central Schools, Brimington, near Chesterfield. Plans, &c., can be seen and bills of quantities and all information obtained at the offices of W. C. Jackson, M.S.A., architect and surveyor, 29, Knifesmith Gate, Chesterfield, upon payment of £1 is. Sealed tenders, endorsed "Brimington Schools," to be sent to C. J. Kerslake, clerk, Education Offices, Foljambe Road, Chesterfield, not later than April 25.

April 25. Abbeyleix.—Additions to the Brigidine Convent, Abbeyleix. The plans and specification relating thereto can be seen at the Convent, Abbeyleix, or at the office of William H. Byrne & Son, architects 20, Suffolk Street, Dublin, to whom tenders must be sent by April 25.

April 27. Nelson.—Erection of twenty (more or less) houses. Plans and specifications may be seen at the office of Osborne & Rees, Nelson. Sealed tenders, endorsed "Tender for Houses," to be sent to T. H. Dowdeswell, Fairfield, Nelson, on or before April 27.

April 27. Chelmsford.—Widening a small brick bridge in the parish of Waltham Holy Cross, known as Broomstick Hall Bridge, for the County Council. Plans and specifications may be seen at the Surveyor's Offices at Chelmsford on any day. Tenders must be delivered to the County Offices, Chelmsford, not later than April 27.

April 27. Chelmsford.—Brick and concrete abutments, &c., for a small bridge at Radwinter, near Saffron Walden, for the County Council. Plans and specifications may be seen at the Surveyor's Offices at Chelmsford. Tenders must be delivered to the County Offices, Chelmsford, not later than April 27.

April 27. Waterloo.—Erection of public library and museum buildings adjoining the Town Hall, Waterloo, near Liverpool, for the U.D.C. Bills of quantities may be obtained from the clerk, upon payment of a deposit of £2 2s. Drawings and specifications may be seen at the office of O. D. Black & A. F. Milligan, architects, Central Chambers, South Castle Street, Liverpool. Sealed tenders, endorsed "Tender for Public Library and Museum," must be delivered to John I. Thompson, clerk to the

Council, Town Hall, Waterloo, near Liverpool, not later than noon on April 27.

April 30. Tywardreath.—*Renovation and alteration of the Wesleyan Church, Tywardreath, Par Station.* Plans and specifications may be seen at the residence of Caleb Thomas, Tywardreath, Par Station, to whom tenders, sealed and endorsed "Church Tenders," must be sent on or before April 30. All further particulars may be obtained at the office of the architect, F. C. Jury, No. 1, Alma Villas, Tregonissey Road, St. Austell.

May 1. North Walsham.—*Erection of a classroom, art-room and offices at Paston Grammar School.* Builders desirous of tendering are requested to send in their names on or before April 19 to the architects, Olley & Hayward, Queen Street, Great Yarmouth, together with a postal order for £1 for a copy of the bill of quantities, which will be forwarded in due course. Endorsed tenders to be delivered at the office of Fairfax Davies, clerk to the Governors, North Walsham, by noon on May 1.

May 1. Leek.—*Extensions to the rectory-house at the Gasworks, Newcastle Road, Leek.* Plans, sections, stipulations and specification may be seen, and bill of quantities and form of tender obtained, at the office of the Surveyor, upon payment of the sum of £1 rs. Fair wages clause. Sealed tenders (upon the form supplied only) and priced quantities and schedule to be forwarded under separate covers, endorsed "Rectory-house Extension," and addressed to the Chairman of the Gas Committee, to be delivered to W. E. Beacham, C.E., surveyor to the Council, Town Hall, Leek, before noon on May 1.

May 2. London, N.—*Erection of a public library at the corner of High Road and Station Road, Wood Green, for the U.D.C.* Builders desirous of tendering should forward their names and addresses to C. J. Gunyon, A.M.I.C.E., the architect, at the Town Hall, Wood Green, not later than 5 p.m. on April 18, accompanied by a deposit of £2 2s. Form of tender and bills of quantities will then be forwarded. Tenders, upon the form supplied only, to be delivered to W. P. Harding, clerk of the Council, Town Hall, Wood Green, N., not later than 5 p.m. on May 2.

May 3. Glasgow.—*Works to be executed in the construction of a potato shed and warehouse on the site of the old City Poor-house to the east of Buchanan Street Goods Station, and of a portion of a bridge to carry Dobbie's Loan for the Caledonian Railway Co.* Drawings may be seen at the office of the Company's Engineer, Buchanan Street Station, Glasgow, where copies of the specification and schedule may be obtained on payment of £2 2s. Sealed tenders, endorsed "Tender for Buchanan Street Station Potatoe Shed, Warehouse and Relative Works," to be lodged with J. Blackburn, secy., Caledonian Railway Co.'s Offices, 302, Buchanan Street, Glasgow, by May 3.

May 3. Sunderland.—*Erection of caretaker's house in connection with Harrison Buildings, in Silver Street.* Drawings and conditions of contract may be seen, and specification, schedule of quantities and form of tender obtained at the Borough Surveyor's Office, Town Hall. Sealed tenders, addressed "To the Chairman of the Health Committee," and endorsed "Tender for Caretaker's House, Harrison Buildings," must be delivered at the Town Clerk's Office, Town Hall, before noon on May 3.

May 5. Rainham.—*Erection of a new Council school to accommodate 250 children at Rainham, Kent.* The drawings and specifications may be inspected at the office of the architect, G. E. Bond, High Street, Rochester. Any person desiring to tender must send in his name to the Architect, accompanied by a deposit of £1, not later than noon on April 20. Tenders, on the form supplied, to be delivered to Ernest C. Harris, 76, High Street, Sittingbourne, not later than noon on May 5.

No date. Anderton.—*Erection of a farmhouse and buildings in Anderton.* Drawings may be seen and quantities obtained at the office of Jolly & Buckley, architects, High Street, Chorley, to whom sealed and endorsed tenders must be sent.

No date. Salisbury.—*Erection of a house.* For particulars apply to J. Harding & Son, architects, 58, High Street, Salisbury.

No date. Southend-on-Sea.—*Erection of a new school for 820 children in Bournemouth Park Road.* Bills of quantities may be obtained and the plans inspected at the offices of the Architects, Greenhalgh & Brockbank, Bank Chambers, Southend-on-Sea, on payment of a deposit of £2 2s.

ENGINEERING.

April 19. Blairgowrie.—*Excavator, mason and plumber work of a new water supply for Persie House, Blairgowrie.* Schedules of quantities can be obtained from Lake Falconer, architect, Blairgowrie, with whom estimates are to be lodged on or before April 19.

April 19. Ystradlyfodwg.—*Driving a tunnel (mining only) 2,100 yds. or thereabouts in length through the Blaenrhondia Mountain, sinking shafts and constructing works in connection therewith, in the parish of Ystradlyfodwg, in the county of Glamorgan, for the U.D.C.* Drawings may be inspected and copies of the specification, schedule of prices and forms of tender obtained upon application to J. E. Hughes, M.I.C.E., engineer, Tynwydd, Treherbert, Glamorgan, upon depositing the sum of £5. Fair wages clause. An assistant engineer will accompany intending contractors along the site of the works on Wednesdays, April 4 and 11, starting from the Engineer's Office at Tynwydd at 11 a.m. Sealed tenders, enclosed in the printed envelopes provided, and addressed to the Chairman of the Gas and Water Committee, endorsed "Tender for Tunnel," must be delivered at the Council Offices, Pentre, Glam., not later than 10 a.m. on April 19.

April 20. Halifax.—*Construction and completion of a single line of railway, about 4½ miles in length, from Holmfild Station to Southowram, in the borough of Halifax, in the West Riding of the county of York, together with certain station works connected therewith,*

according to plans, specifications and conditions prepared by Myers-Beswick & Partners, of Leeds, engineers. Specification and bill of quantities can be obtained on application to Land & Foster, solicitors, 13, Ward's End, Halifax, to whom tenders must be delivered not later than April 20.

April 21. Bandon.—*Laying of additional water mains in the town of Bandon, in accordance with plan and specification, which may be seen and inspected at the R.D.C. room at the workhouse.* Intending contractors should have experience in laying and jointing water pipes, and a detailed estimate and schedule of prices must accompany each tender. The works must be completed within three months from the date of acceptance of tender under a penalty of £2 per week, or portion of a week beyond the time allowed. Tenders, containing the names of two solvent sureties willing to become bound with the contractor in a bond for double the amount of the contract, for the due performance of the contract, to be lodged with A. Haynes, clerk of District Council, Council Room, Workhouse, Bandon, before noon on April 21.

April 23. Littlehampton.—*Steel bridge over the River Arun at Littlehampton, to consist of a swing span and a fixed span, for the U.D.C.* Tenders are also invited for the construction of the approaches and abutments in connection with the bridge. Tenders must be sealed and endorsed either "Tender for Bridge" or "Tender for Approaches," and must be delivered to A. Shelley, clerk, not later than 9 a.m. on April 23. For the bridge only those tenders from firms who have erected similar bridges will be considered, and the tenderers must give the names of the swingbridges they have erected. On a deposit of £5 5s. drawings may be seen and copies of the specification, general conditions, bill of quantities and forms of tender obtained on application to the engineer, Major Hector Tulloch, C.B., R.E. (retired), 28, Victoria Street, Westminster, London, S.W., or to Arthur Shelley, clerk, Town Offices, Littlehampton.

April 23. Southampton.—*For the reconstruction of the tramway in the Avenue.* Specification, conditions and form of tender can be obtained upon application to the general manager and engineer, H. F. Street, at the Tramway Office, Above Bar Street. Sealed tenders, endorsed "Tender, Tramways Avenue," must be delivered at the Town Clerk's Office, before 2 p.m. on April 23.

April 23. Bamford.—*Construction of the Bamford filters and the Derwent to Grindleford section of the Derwent aqueduct, in the county of Derby, for the Derwent Valley Water Board.* The work will comprise:—Roughing filters, 3,500 sq. yds.; sand filters, 21,000 sq. yds.; cut and cover, ½ mile; 45 in. pipelaying, 7½ miles; with valve-houses, stream crossings, &c. The specification and schedule of prices and copies of the drawings may be obtained on application to Edward Sandeman, M.I.C.E., engineer to the Board, on payment of £5 5s. Sealed tenders, enclosed in the printed envelope supplied with the documents, to be delivered to O. B. Steward, clerk to the Board, Bamford, near Sheffield, not later than 9 a.m. on April 23.

April 24. London, S.W.—*Reconstruction of Victory Bridge over the Regent's Canal, in the borough of Stepney and the administrative county of London, for the County Council.* Persons desiring to submit tenders may obtain the drawings, specification, bills of quantities, form of tender and other particulars, upon application to the chief engineer, Maurice Fitzmaurice, C.M.G., at the County Hall, Spring Gardens, S.W., upon payment to the cashier of the Council of the sum of £3. Tenders must be upon the official forms, and the printed instructions contained therein must be strictly complied with. Fair wages clause. Each tender is to be delivered at the County Hall, in a sealed cover, addressed to the Clerk of the London County Council, Spring Gardens, S.W., and marked "Tender for the Reconstruction of Victory Bridge." No tender will be received after 10 a.m. on April 24.

April 24. Basford.—*Providing and laying about two miles of 3 in. and 2 in. cast-iron water mains, with all necessary valves, &c., in the parish of Strelley, near Nottingham, for the R.D.C.* Plans and specifications may be seen by appointment, and bills of quantities and tender forms obtained from S. Maylan, surveyor, Public Offices, Basford, Nottingham, on deposit of £2 2s. Sealed tenders, endorsed "Tender for Strelley Water," addressed to the Clerk to the R.D.C., must be delivered free at the Public Offices, Basford, Nottingham, not later than 9 a.m. on April 24.

April 24. Manchester.—*Reconstruction of Dawson Street Bridge over the River Medlock, and Carruthers Street Bridge over the Ashton Canal.* Drawings may be seen, and specification, bill of quantities and form of tender obtained on application at the City Surveyor's Office, Town Hall, Manchester, on payment to the City Treasurer of £2 2s. All cheques or postal orders are to be made payable to the order of "The Corporation of Manchester." Tenders, enclosed in the official envelope and addressed to the Chairman of the Improvement, &c., Committee, to be delivered at the City Surveyor's Office not later than 10 a.m. on April 24.

April 25. London, E.C.—*Deck spans (from 6 ft. to 33 ft. in the clear), as per specification, for the East Indian Railway Co.* Specification, for which £1 rs. (not returnable) will be charged, can be obtained at the Company's Offices. Tenders to be marked "Tender for Deck Spans," and sent in to C. W. Young, secretary, Nicholas Lane, London, E.C., by noon on April 25.

April 25. Brussels.—*Railway plant.* For the construction of the Erezée to Hottot section of the local railway from Comblain la Tour to Manhay and Melreux. Estimated cost 168,000 fr. (£6,720). A deposit of 16,000 fr. (£640) will be required. A copy of the specification may be obtained, price 1 fr., from M. l'Hoir, rue Edouard-Wacken, 10, Liège. Tenders in sealed envelopes should be addressed to the General Manager, Société Nationale des Chemins de Fer Vicinaux, 14, rue de la Science, Brussels, by April 25.

April 27. Sofia.—*Bridge-work.* For the construction of a bridge over the Wladajuss, at an estimated cost of 50,000 frs. (£2,000), for the Town Council, Sofia, by whom tenders will be received up to April 27.

April 30. Darlington.—*Supply, delivery and erection of a counter current jet condensing plant complete with piping and cooling tower.* Plans, specification and form of tender may be obtained from the Borough Electrical Engineer, Electricity Works, Haughton Road, Darlington, on payment of a deposit of £1 rs. Sealed tenders, endorsed "Condensing Plant," to be delivered at the office of H. G. Stevenson, town clerk, Houndgate, Darlington, on or before April 30.

May 1. London, N.—*Hot-water heating apparatus for Pavilion No. 1 at the Northern (Convalescent) Fever Hospital, Winchmore Hill, N., for the Metropolitan Asylums Board, in accordance with drawings and specification prepared by W. T. Hatch, M.I.C.E., M.I.M.E., engineer-in-chief.* Drawings, specification, conditions of contract and form of tender may be inspected at the Office of the Board, Embankment, London, E.C., and obtained upon payment of a deposit of £1. Tenders, addressed as noted on the form, must be delivered at the Office of the Board not later than 10 a.m. on May 1.

May 2. London, E.C.—*Extension of Parkeston Quay and construction of a shed and sidings in connection therewith, for the Great Eastern Railway Co.* Persons desirous of tendering can, on application to the Engineer, obtain copies of the specifications and quantities, and the drawings can be inspected at his office at Liverpool Street on and after April 17 between 10 and 4. Sealed tenders, endorsed, "Tender for Extension of Parkeston Quay," Contract No. 1, should be addressed to W. H. Pepper, come, and must be delivered at the Secretary's Office, Liverpool Street Station, not later than 10 a.m. on May 2. Tenders to be sent through the "General Post Office." Any sent otherwise will not be considered. The sum of £10 rs. will be charged to each applicant for the specification and quantities, schedules and form of tender.

May 5. Guernsey.—*Quay wall, with low-level landing, on the southern side of St. Julian's Emplacement, Harbour of St. Peter-Port, Guernsey.* Drawings of the proposed works may be inspected, and the general conditions, specifications and forms of tender and other particulars obtained, upon application at the States Offices, Guernsey, on payment of £5. Tenders, enclosed in sealed envelopes, endorsed "Tender for Quay, St. Julian's," and addressed to John N. Brouard, supervisor of the harbour, &c. &c., must be delivered so as to reach the States Office, Guernsey, on or before 3 p.m. on May 5.

May 8. Deptford.—*Construction of a footbridge for the Borough Council, according to the drawings and specification which may be seen at the Borough Surveyor's Office at the Town Hall after April 23, during the ordinary office hours.* It will be a condition of the contract that the steelwork must not be sublet. Fair wages clause. Bills of quantities prepared by W. T. Farthing & Son, together with the conditions of contract, may be obtained from the Town Clerk, Town Hall, Deptford, upon payment of a deposit of £1 rs. Persons desirous of tendering must send their names to the Town Clerk on or before April 27, to whom sealed tenders, in accordance with the Council's regulations printed on the form of tender, must be sent not later than 4 p.m. on May 8.

May 11. Flamborough.—*For the construction of waterworks at Flamborough, Yorkshire, including supplying and laying 2½ miles of 3 in. cast-iron pipes with all appurtenances, the construction of brick reservoir (capacity 50,000 gallons), and the erection of an engine-room.* Plans can be seen at the offices of the engineers, Elliott & Brown, Burton Buildings, Parliament Street, Nottingham, from whom copies of the specification and bills of quantities and form of tender can be obtained on deposit of £2 2s. Sealed and endorsed tenders to be delivered to George Hankinson, clerk to the Bridlington R.D.C., Long Lane, Bridlington, on or before May 11.

May 12. Brussels.—*Railway plant.* For the construction of the section from S. Cécile to the French frontier, of the railway from Bertrix to the frontier via Munro. Estimated cost, 3,500,000 francs (£140,000); deposit, 190,000 francs (£7,600). Specifications ("cahier des charges," special No. 27) may be obtained at the Bourse, Brussels (price 4 francs 70 cents), where tenders will be received up to May 12.

May 12. King's Lynn.—*Waterworks extension.* Contract No. 1: Supplying and fixing slow-speed steam engine (surface condensing, differential, or cross-compound horizontal), pumps, condensers and the necessary alterations to existing steam pipes, delivery mains, &c. Contract No. 2: Sinking and lining an 8 ft. diameter well. Contract No. 3: Supplying and fixing one 24 ft. by 6 ft. 6 in. Lancashire boiler, and a 48-tube economizer, with all the necessary sealings, chambers and alterations to existing flues. Contract No. 4: Supplying and fixing a cast-iron tank 13 ft. by 6 ft. 6 in. Contract No. 5: Extensions to engine-house and mechanics' shop. General conditions, stipulations, specifications, bills of quantities and forms of tender may be obtained from and drawings inspected on application to J. H. Webb, waterworks engineer, Town Hall, King's Lynn, on and after April 17, upon receipt of a deposit of £3 3s. for contract No. 1 and £1 rs. each for contracts Nos. 2, 3, 4 and 5. Sealed tenders, endorsed "Tender for Waterworks," to be delivered to J. W. Woolstencroft, town clerk, Town Hall King's Lynn, by May 12.

May 16. Brussels.—*Railway plant.* For the construction of the Jodoigne to Esmel section of the local railway from Jodoigne to Tirlemont and St. Trond, and of buildings and roads in connection therewith. The estimated cost is 401,000 fr. (£16,040), and a deposit of 40,000 fr. (£1,600) is required. A copy of the specification may be obtained on payment of 1 fr. from M. Darteville, rue de Turquie, No. 18, Saint Gilles, Brussels. Tenders, in sealed envelopes, should be addressed to the General Manager, Société Nationale des Chemins de Fer Vicinaux, 14, rue de la Science, Brussels.

May 23. Brussels.—*Railway plant.* For the construction of the Gembe to Graide section of the local railway from Rochefort to Wellin and Graide. The estimated cost is 205,000 frs. (£8,200), and a deposit of 20,000 frs. (£800) will be required. A copy of the specifications may be obtained for 1 fr. from M. Rigot, rue Lucien-Nameche, 39, Namur. Tenders, in sealed envelopes, should be addressed to the General Manager of the Société Nationale des Chemins de Fer Vicinaux, 14, rue de la Science, Brussels.

May 23. Bristol.—Electrically-driven hydraulic pressure pumps. Erecting in the existing engine-house, Under fall Yard, testing and maintenance for twelve months after completion, of three sets of electrically-driven hydraulic pressure pumps. Each set is to be capable of delivering 150 gallons of water per minute against an accumulator pressure of 750 lbs. per sq. in. The contract includes the pumping machinery, and also the electro motors and accessories, and gearing for driving the pumps. On and after Thursday, April 12, copies of the specification, form of tender, form of contract and copies of contract drawings can be obtained from W. W. Squire, Engineer's Office, Cumberland Road, Bristol, on production of a receipt from the secretary of the Docks Committee showing that £5 has been paid as deposit. Tenders must be enclosed in a sealed envelope, endorsed "Tender for Electrically-driven Hydraulic Pressure Pumps," and addressed to the Secretary of the Docks Committee, 19, Queen Square, Bristol, and must be delivered to him, accompanied by the prescribed documents, before 10 a.m. on May 23.

June 2. London, N.—Supply and erection of a refuse destructor complete in all respects, for the Southgate U.D.C. Copies of the specification and full particulars may be obtained from C. G. Lawson, C.E., surveyor to the Council, on depositing a Bank of England note for £5 with him. Sealed tenders, endorsed "Tenders for Refuse Destructor," must reach W. M. Ellenor, clerk to the Council, Council Offices, Palmer's Green, London, N., not later than June 2.

IRON AND STEEL.

April 23. Sofia.—Steel nails, switching apparatus, bolts, &c., for the State Railway Directorate, Sofia, by whom tenders will be received up till April 23.

April 24. London, S.W.—Supply bearing springs, for the Secretary of State for India. The conditions of contract may be obtained on application to the Director-General of Stores, India Office, Whitehall, S.W., and tenders are to be delivered at that office by 2 p.m. on April 24.

May 3. London, E.C.—Wrought-iron hinges for the Great Indian Peninsular Railway Co. Specifications and forms of tender may be obtained at the office on payment of the fee for the specification, which payment will not be returned. Tenders must be delivered in sealed envelopes, marked "Tender for Wrought-iron Hinges," and delivered to J. I. Berry, secy., Company's Offices, 48, Cophall Avenue, E.C., not later than 11 a.m. on May 3.

PAINTING AND PLUMBING.

April 19. London, N.—Whitewashing, &c., at the infirmary, Highgate Hill, N., in accordance with specification and conditions of contract, copies of which may be obtained on application to the Steward there between 8.30 a.m. and 5 p.m., up to April 15. Tenders must be sealed up, addressed to the Guardians, and delivered at the Guardians' Offices, St. John's Road, Upper Holloway, N., not later than 4 p.m. on April 19, endorsed "Whitewashing."

April 21. Blaydon.—Painting and colouring the following schools during the Midsummer recess:—Dunston Council, Swolwell Council, Martey Hill Colliery Council, Blaydon Council (Boys' and Girls' Department) High Spen Council. Specifications and forms of tender, to be returned not later than April 21, may be obtained from I. George Maguire, 7, Wallace Terrace, Ryton-on-Tyne.

April 21. York.—Painting, &c., of the schools in various districts. Apply to the Secretary, Education Offices, Clifford Street, York. Tenders to be in by April 21.

April 23. Preston.—Painting fifteen iron outside staircases at Whittingham Asylum, near Preston. Particulars and specification may be obtained at the Asylum. Tenders to be in before 10 a.m. on April 23.

April 24. Conway.—Cleaning, scraping and painting Conway suspension bridge, according to the specification, &c., of the engineer and surveyor, F. A. Delamotte, Town Hall, Conway, at whose office form of tender and all information may be obtained on payment of £1. Tenders, endorsed "Bridge Painting," to be forwarded to T. E. Parry, town clerk, Conway, on or before April 24.

April 30. London, W.—Painting, colouring, cleaning, repairs and alterations at the schools at Southall, 9 miles from London, on the Great Western Railway, for the St. Marylebone Guardians. Persons desiring to tender may obtain specifications and forms of tender upon application to the Superintendent of the Schools, any day from April 18 to April 27, between 10 and 12. Tenders to be sealed and endorsed, "Tender for Painting, &c., Schools," and delivered at the Guardians' Offices, at Northumberland Street, W., at or before 10 a.m. on April 30.

ROADS AND CARTAGE.

April 20. Tulchan Moors.—Surface drains, and make footpaths through the Tulchan Moors. Offers will be received by John Cruickshank, Tulchan Lodge, who will show intending offerers over the ground, upon receiving two clear days' notice (except Saturdays), up to and including April 20.

April 21. Peabworth.—Hauling materials from the respective railway stations, quarries and pits to the highways, for the R.D.C. Printed forms of tender and specification of the quantities to be hauled to the respective roads, and full particulars can be obtained on application to Edward Wadams, clerk to the Council, Union Offices, Evesham, to whom tenders must be sent not later than April 21.

April 21. Jersey.—Laying about 2,300 yds. of creosote deal wood paving and granite setts in Halkett Place and York Street. Plans and specification can be obtained from the Town Surveyor, Town Hall, Jersey, on payment of £1 1s. Tenders, sealed and enclosed in

envelopes, are to be delivered at the Town Hall before 5 p.m. on April 21.

April 23. Chorley.—Moss Lane widening, Whittle-woods, for the R.D.C., plans and specifications of which may be seen by appointment with Edward Lawrence, highway surveyor, Shaw Green, Euxton. Sealed tenders, endorsed "Tender for Moss Lane Improvement," to be delivered to John Whitfield, clerk, 10, High Street, Chorley, not later than April 23.

April 23. London, N.W.—For the following works, for the Hendon U.D.C.:—About 400 yds. lineal 12-in. pipe sewer and surface-water drain in Finchley Road Golders Hill, &c.; about 925 yds. lineal gin. pipe sewer, together with man-holes, flushing-chamber, ventilators and other works in connection therewith; also for sewerage, levelling, kerbing, channelling and paving and other works in connection with the making-up of Ebenezer Road and Mews, Child's Hill. The drawings and specifications may be seen and form of tender obtained of S. Slater Grimley (engineer to the Council), at the Council Offices, Hendon, on deposit of £10. Sealed tenders, endorsed "Finchley Road Sewerage, &c.," addressed to the Chairman of the Council, to be sent to Henry Humphris, clerk to the Council, Council Offices, The Burroughs, Hendon, N.W., not later than 5 p.m. on April 23.

April 24. West Hartlepool.—Construction of Baltic Street footpath, west side (between Oxford Street and Casebourne Road), and 12-in. pipe sewer at Stranton Green (between Burbank Street and Back Green Street). Plans, sections and specifications can be seen, and approximate quantities obtained, upon application at the Borough Engineer's Office. Tenders, endorsed "Construction of Streets," addressed to the Chairman of the Works Committee, are to be delivered at the office of the Town Clerk, 78, Church Street, not later than 4 p.m. on April 24.

April 26. Newport (Salop).—Hauling of materials on to the district roads for the R.D.C. Forms of tender can be obtained from the Clerk to the Council, to whom tenders marked "Tender for Hauling" must be forwarded not later than April 26.

April 26. London, S.E.—Tar-paving work at the Infirmary, East Dulwich Grove, S.E., for the Guardians. The specification and conditions can be seen and all information obtained at the offices of the Steward, at the Infirmary, between 10 a.m. and 4 p.m. Tenders, endorsed "Tar-paving Work," should be addressed to the Guardians and delivered to Howard C. Jones, clerk, Union Offices, John Street West, Blackfriars Road, S.E., by 4 p.m. on April 26. Fair wages clause.

SANITARY.

April 23. Blackburn.—Erection of a sewage pumping station at Witton Eyes, within the borough of Blackburn. Specification, bill of quantities and form of tender may be obtained at the Engineer's Office. Sealed tenders, properly endorsed, to be delivered to William Stubbs, A.M.I.C.E., borough and water engineer, Municipal Offices, Blackburn, not later than noon on April 23.

April 23. Macroom.—Construction of sewerage works in accordance with plans and specification prepared by A. W. Barnard, C.E., to be seen at the Clerk's Office. Sealed tenders, addressed to the presiding chairman, and containing the names of two solvent sureties willing to enter into a bond with the contractor for double the amount, of the contract for the due and faithful fulfilment of same, to be lodged in the tender box in the Council Office up to 4 p.m. on April 23. A sum of £10 in cash to be lodged with each tender, which will be returned on completion of the bond.

April 23. London.—Destroying and filling-in disused sewer in Finsbury Pavement (between London Wall and West Street) according to specification and plan to be seen at the office of the Engineer to the Corporation, Guildhall, where forms of tender may be obtained. Tenders must be on the before-mentioned forms, and must be addressed Town Clerk, Public Health Department, and delivered at the office of the Hallkeeper, Guildhall, between 12.30 and 1.30 on April 23.

April 23. Lye.—Construction of a brick barrel sewer for the Upper Stour Valley Main Sewerage Board. Plans, sections and detail drawings may be seen and specifications and bills of quantities obtained at the offices of the engineers to the Board, E. B. Marten, M.I.C.E., and W. Fiddian, F.S.I., Stourbridge, on payment of £1 1s. Sealed tenders, endorsed "Tender for Sewer at Lye," are to be delivered to George Green, clerk to the Board, Cradley Heath, by noon on April 23.

April 24. Bristol.—Construction of five public conveniences in various parts of the city. Drawings and specifications can be seen at Engineer's Office, and bills of quantities obtained, on deposit of a cheque value £2. Tenders must be made out on the form provided, and all blanks must be filled in, otherwise the tender will not be considered. Sealed tenders, enclosed in the envelope provided, to be delivered before 5 p.m. on April 24, addressed to T. M. Yabbicom, M.I.C.E., city engineer, 63, Queen Square, Bristol.

April 24. West Hartlepool.—Construction of wooden outlet extension at the Stell, south of Carr House, on the foreshore, in accordance with the plans and specifications to be seen upon application at the Borough Engineer's Office. Tenders, endorsed "Outlet at Stell," and addressed to the Chairman of the Works Committee, are to be delivered at the office of the Town Clerk, 78, Church Street, not later than 4 p.m. on April 24.

April 25. St. Columb Minor.—Construction of sewers, from 7 ins. to 6 ins. in diameter, with manholes, lamp-holes and other appurtenances, and for certain works in connection with the preparation of lands for sewage irrigation, for the R.D.C. The total length of sewer is intended to be about 2,500 yds. General and detail drawings may be seen, the specification examined, and bills of quantities obtained at the office of the engineer, R. Hansford Worth, 42, George Street, Plymouth. All tenders must be delivered in sealed envelopes, endorsed

"Tenders for St. Columb Minor Sewerage," accompanied by fully priced out and totalled bills of quantities, and addressed to Charles E. Whitford, clerk, Fore Street, St. Columb Major, Cornwall, by April 25.

April 30. Carlisle.—Sewage-disposal works, Contract No. 1: The erection and construction of pumping station, sedimentation tanks, filters, &c. Contract No. 2: Centrifugal pumps, motors, switchboards, &c. Contract No. 3: Sewage screens, elevators with motors. Parties desiring to submit tenders may inspect the drawings and conditions of contract and obtain specification, bills of quantities and forms of tender and other particulars upon application to H. C. Marks, city engineer, on deposit of the sum of £5 in the case of Contract No. 1 and £2 2s. in the case of each of the Contracts Nos. 2 and 3. Tenders must be on the official forms, and the printed instructions contained therein must be strictly complied with. Each tender, in a sealed envelope, together with the filled-up bill of quantities, must be endorsed "Tender for Sewage Works," and delivered to Henry C. Marks, M.I.C.E., city engineer and surveyor, 36, Fisher Street, Carlisle, not later than 10 a.m. on April 30.

April 30. Middleton.—Construction of three circular tanks, catchpits, conduits, &c., at the Sewage Outfall Works at Rhodes. Plans may be seen and specifications, quantities and form of tender (which includes a fair wages clause) obtained on and after April 5 by applying to W. Welburn, borough surveyor, Town Hall, between 9.30 and 10.30 a.m., on depositing £1 1s. Tenders, endorsed "Tender for Tanks," are to be addressed to the Chairman of the Surveyor's Committee, and delivered at the Town Clerk's Office on or before April 30.

April 30. Havant.—Constructing and maintaining stoneware and iron pipe sewers, manholes, ventilating shafts, pump wells, pumps and machinery, septic tanks, filter beds, outfall sewer, and other work, in accordance with plans, specifications and general conditions of contract prepared by A. E. Stallard, F.S.I., Havant, Hants (engineer to the Council), and Lemon & Blizard, M.M.I.C.E., Lansdowne House, Castle Lane, Southampton, and 11, Victoria Street, Westminster (consulting engineers). Contractors may inspect the plans and specifications at the offices of the District Council, West Street, Havant, and obtain copies of bills of quantities, specification of works, and form of tender, on payment of the sum of £5. The successful contractor will be required to enter into a bond with two sureties in the sum of £1,000 for the due performance of the contract. Sealed tenders, on printed forms supplied, are to be delivered to E. R. Longcroft, clerk to the Council, West Street, Havant, on or before noon on April 30.

May 4. Penrith.—Construction of about 2,500 yds. of 21-in. stoneware main outfall sewer and contingent works, for the U.D.C. General conditions, specifications, bills of quantities and forms of tender may be obtained, and drawings inspected, at the Town Hall, Penrith, upon receipt of a deposit of £2 2s. Full information may be obtained from the engineers, Brierley, Holt & Co., of Blackburn and Blackpool, or from the resident engineer, J. J. Knewstubb, Town Hall, Penrith. Sealed tenders, endorsed "Penrith Sewerage—Contract No. 1," must be delivered to George Wainwright, clerk of the Council, Town Hall, Penrith, not later than May 4.

MISCELLANEOUS.

April 21. Perth.—Supply of the following materials, for the Town Council:—Whinstone causeway, kerb, channel, &c.; freelay drain pipes, traps, &c.; cast-iron street gulleys, manway covers; sand and gravel; cement; carting; lime and bricks. Specifications and forms of tender may be had at the Burgh Surveyor's Office, 16, Tay Street, Perth. Tenders, endorsed "Supplies for Burgh Surveyor's Department," to be lodged with John Begg, town clerk, on or before April 21.

April 23. Dublin.—Supply of the following stores, for the Dublin, Wicklow and Wexford Railway, for twelve months from 1st May. Specifications, with form of tender, price 6d. each, can be had on application to the Secretary:—Iron; tin; iron castings; varnishes; steel files; paints, oils, &c.; brushes; carriage bolts; ironmongery; glass; native timber; foreign timber; slates, tiles, &c.; cement; permanent way fastenings; plumbing and gasfitting. Tenders, sealed, marked "Tender for Stores," and addressed to the Secretary, Dublin, Wicklow and Wexford Railway, Westland Row Station, Dublin, to be sent in so as to reach him not later than 10 a.m. on April 23.

April 24. Wallasey.—Supply of the following stores, for the Gas and Water Department of the U.D.C.:—Wrought-iron tube; stop cocks and main taps; lead pipe, &c.; wrought-iron bars and steel plates; cast-iron main pipes; valves and hydrants; oils, paints, brushes; gas and water meters; retorts and firebricks; block and sheet tin, &c. Further particulars, with form of tender, may be had, and samples inspected, on application to the Gas and Water Engineer's Office, Dock Road, Seacombe. Sealed tenders, which must be on the printed form, endorsed "Tenders for Gas and Water Stores," to be addressed and delivered (per post) to H. W. Cook, clerk and solicitor, Public Offices, Egremont, Cheshire, not later than the morning of April 24.

April 23. Teddington.—Supply of the following materials, for the U.D.C.:—1,000 yds. of broken granite and 2,000 yds. of flints, to be delivered as required, either by barge alongside the Teddington public landing wharf on the River Thames, or by rail at the London and South-Western Railway Station, Teddington. Also for the execution of all smith's work and team labour, the supply of tools and implements, pipes, gulleys, &c. Specifications and forms of tender, together with particulars, may be obtained on application to Marshall Hainsworth, surveyor, Council Offices, Teddington. Sealed tenders, endorsed "Tenders for Granite, Flints, Smith's Work, Team Labour, Tools and implements, Pipes, Gulleys, &c.," as the case may be, to be delivered to G. H. Salmon, clerk, Council Offices, Teddington, not later than April 28.

TENDERS cont. from p. xi.

London.—For heating apparatus for Senrab Street School, Stepney, for the London County Council Education Committee:—

Burghill Parish Church, Hereford.—An oak reredos with panelling round the chancel walls has been erected in this church. The central opening of the reredos forms a niche for the altar cross, with a projecting canopy above and two recessed niches on either side, finished with octagonal-shaped buttresses at the ends, on which buttresses will be placed figures of angels holding trumpets; the side niches will also have carved figures introduced at a later date. The work has been carried out in character with the old rood screen by Mr. F. Dredge, from designs by Mr. H. Skyrme, architect, of Hereford.

Buildings and Earthquakes. THE appalling disaster at San Francisco has drawn attention to the design of buildings in districts liable to earthquake shocks. The reports which have appeared in the daily press are not quite definite enough to enable us to criticize the construction adopted for many of the important buildings in the wrecked city, but it would appear from a telegram dated April 22nd through Reuter's agency, which is usually well informed, that the modern steel-frame buildings have stood remarkably well, and that the solid masonry construction of the older kind, although employed for buildings of much less height than the modern office structures, has proved unsound. It is said that while the interiors of the tall buildings were ruined the walls stood steady and true, a notable example being the "Call" building, twenty storeys

high, the tallest building in San Francisco, which still has every floor intact. It has always been admitted, from experience, that the only way to guard against earthquake shocks is to tie a building in every way possible, and to secure a strong foundation. We published in our issue for September 19th, 1900, a report of the Japanese Earthquake Investigation Committee, together with illustrations showing a type of timber construction advocated. Here the system of tying the structure together was employed in every direction. The principles which apply to timber structures are also those of a steel frame, and where timber is not possible of adoption for very large buildings steel naturally and adequately serves the necessary function. The structure needs to be calculated vertically to resist flexure when inclined and subjected to the vibration of earth tremour. Independent foundations are inadvisable for such situations, but naturally on a site of large area it would be impossible to calculate the foundation to float as a raft on top of the earth waves that occur in an earthquake. We think that the better way would be to frame the base of the building with steel in the form of a sill braced at the corners. With a frame structure there is usually not very much bond between the brick facing and the steel, and when a building is inclined and vibrating the walls would have a tendency to peel away; this, in fact, is stated to have been the case in some of the buildings at San Francisco. In America they erect a frame first and then apply the walls at different heights, supporting each floor independently on flanges riveted to the steel. With this system, however, there is not, as a rule, sufficient bond between the brickwork and the steel, and we are of opinion that where earthquake shocks have to be met the walls should be tied in at every point by hangers riveted to the steel. Better still would be to employ reinforced concrete. There is some nonsensical talk about the desirability of framing these buildings so as to give a certain amount of "play." Anyone, however, acquainted with the science of construction knows that this would be disastrous.

The Works at Winchester Cathedral.

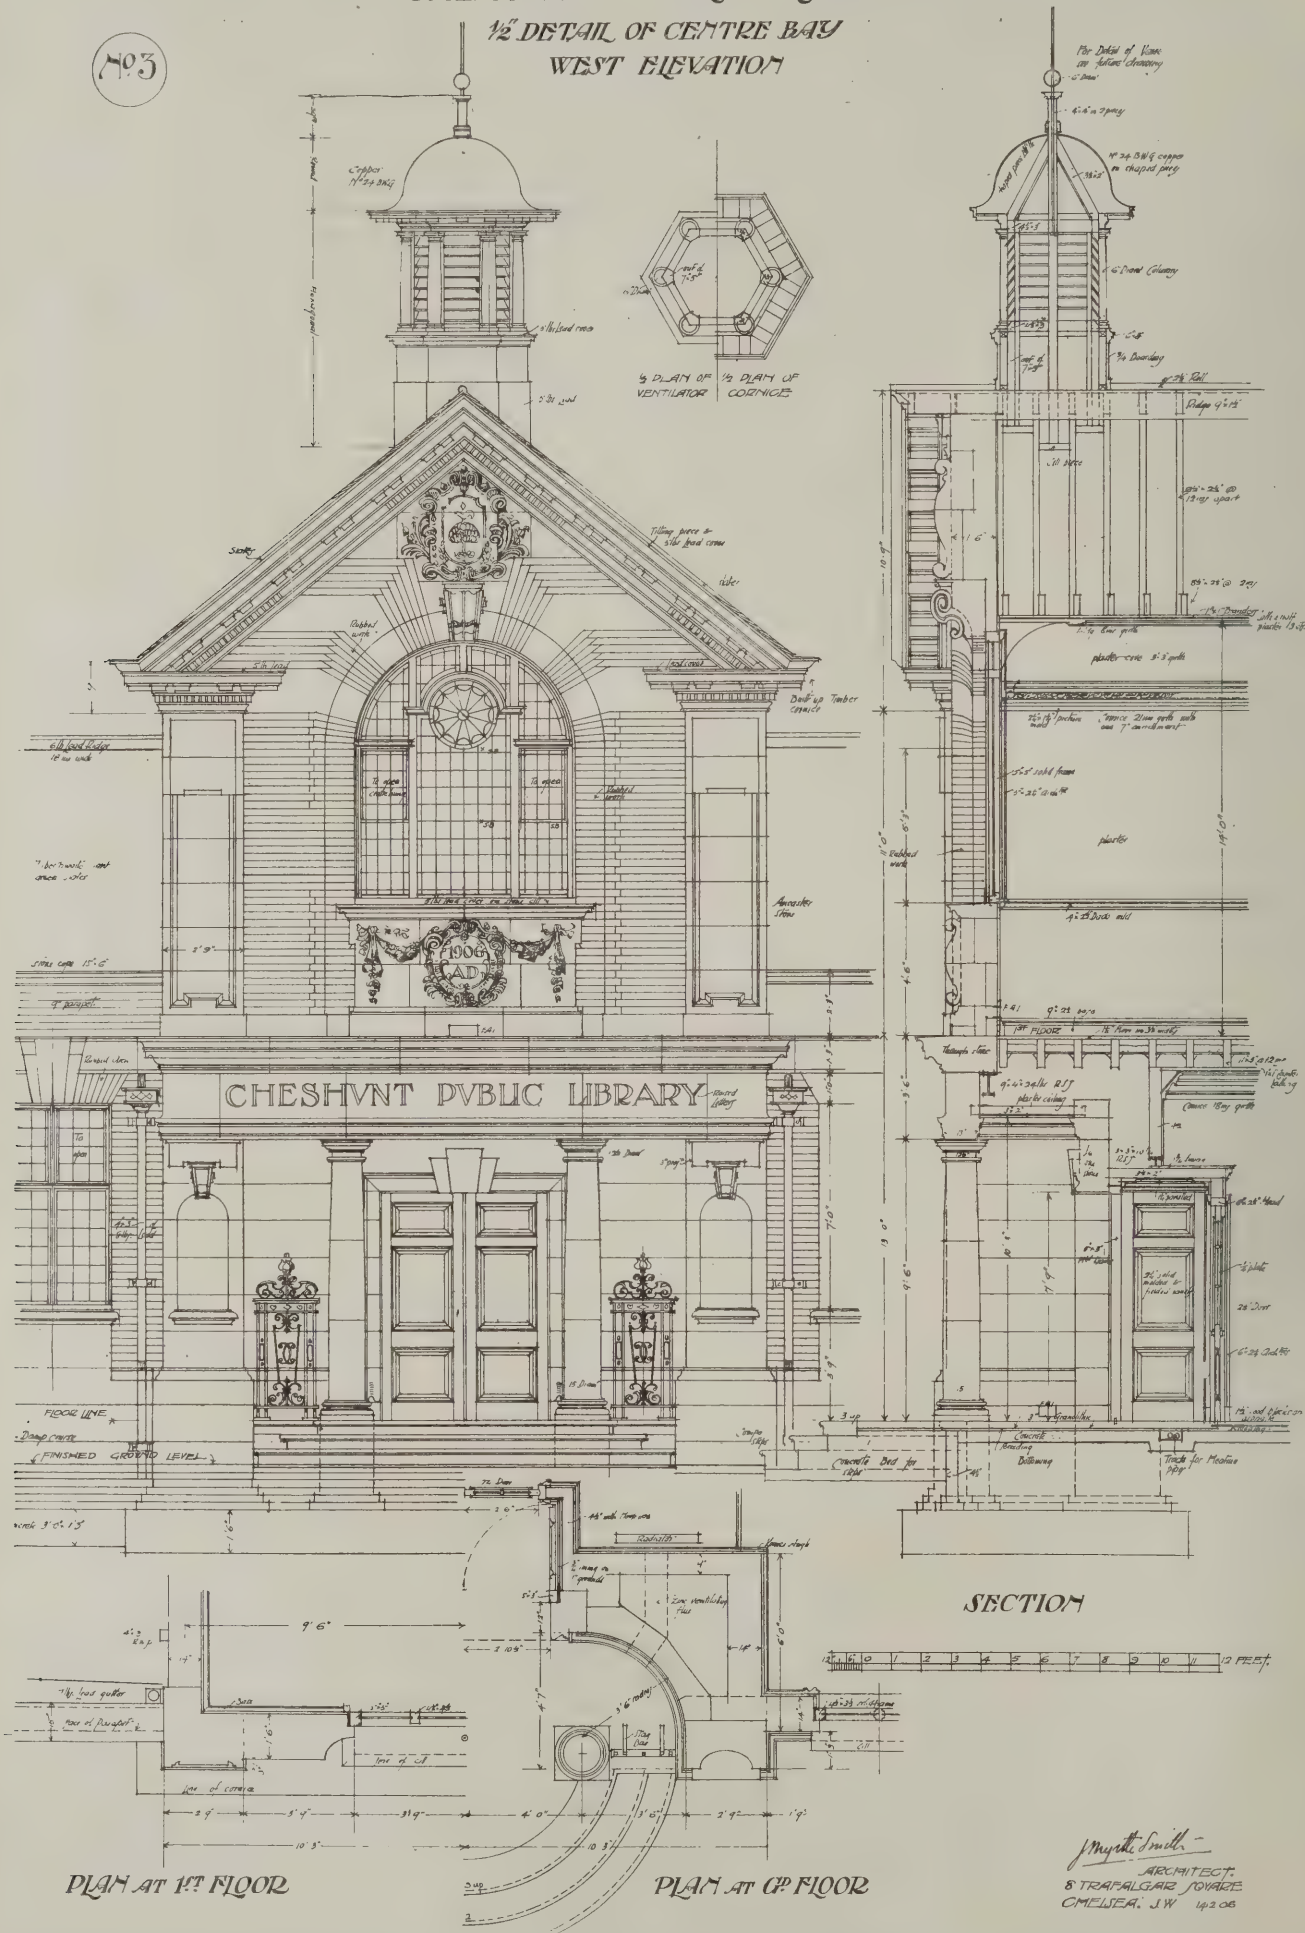

Mr. T. G. JACKSON reported to the Dean of Winchester on March 25th on the work done to the south and north sides of the east end of the south aisle of Bishop de Lucy's building. Mr. Jackson first shored up, in August last, the greater part of the south side, and bonded across the cracks in the wall with long blocks of hard Yorkshire stone, which were grouted with a Greathhead machine. The roof is now to have tie-rods fixed to take the strain, and this is expected to be completed about the end of this month, when the underpinning will be proceeded with. Mr. Jackson called attention to the fall, in February last, of an ashlar filling-in stone

in the north aisle vault of the Waynfleet Chantry, and he says that the scaffolding which has since been erected has enabled an inspection to be made, which shows that it is seriously affected. The underpinning, which is the chief difficulty, was started in the crypt of the Lady chapel. The mischief was found to be due to the sinking of the central pillar, a large square stone on which the column stood being broken and tilted up at the corners. Below was a 15in. timber pile, which was so rotten that it could be cut with a spade, like cheese. The new foundation, of cement-concrete and brick, has been put in resting on the gravel, and the second column is being treated like the first. When the underpinning of the main walls was proceeded with it was found that these had been erected on two layers of trees laid across one another in a mass of loose chalk. Some were decayed, while others were still sound. The builders, Mr. Jackson thinks, seem to have gone down with their foundation to the water level, and not knowing how to deal with the difficulty, used timber. Had this timber foundation been a good deal wider than the walls, so as to increase the supporting area, it might have been successful. As it is, it has been crushed down into the soft ground overlying the peat, resulting in the settlement that is causing the trouble. Towards the east, there seems to have been a bog, for there is a layer of peat 5ft. thick above the gravel bed. In consequence, the building has slipped eastward, parting at the great cracks which are now exposed. In November last the underpinning at the east end, *i.e.*, the east wall of Bishop Langton's chapel, was begun, Mr. Jackson's proposal being to put in a foundation on the gravel bed to arrest the slipping tendency. When the layer of peat was pierced, however, the water sealed down by this impervious layer was tapped, and it rushed up from the gravel bed. The attempt to dredge out the peat from under the water was unsuccessful. Pumping was found not to remove the gravel, so that has been resorted to, the peat scooped out, and cement-concrete in bags laid on the gravel, upon which the final underpinning with brickwork in cement was done. The next piece of underpinning, Mr. Jackson states in a supplementary report, dated April 7th, presented fresh difficulties, as a thin layer of chalky matter was found to overlies the gravel, and as this would have been drawn out by the pumping, the only thing to be done was to act on a suggestion made by Mr. Francis Fox and employ divers. These divers have now taken out the peat and laid down the first stratum of the new foundation, so as to seal down the spring, leaving only the surface water to be dealt with by the pump. Mr. Jackson states that he thinks now they will be able to make more rapid progress. The results will be watched with interest.

CHESTNUT PUBLIC LIBRARY

1/2 DETAIL OF CENTRE BAY WEST ELEVATION

103

J. Myer Smith -
ARCHITECT,
8 TRAPALGAR SQUARE
CHELSEA, S.W. 1906

CHESHUNT PUBLIC LIBRARY.

THE detail drawings of the Cheshunt public library which we publish this week are self-explanatory, all dimensions and particulars of the work being given on them. Mr. J. Myrtle Smith, it will be remembered, was the successful architect in the competition for the building, which was decided last November, his first-premiated design having been published in our issue for November 15th, 1905. The library is estimated to cost nearly £3,000. In publishing these detail drawings of it we would mention how very infrequently we are able to obtain such from architects in this country. We wish we could more often get them, as they are most instructive and interesting from a technical point of view.

AMERICAN IDEAS ON COMPETITIONS.

A GOOD deal of attention to architectural competitions has lately been given in the American journals in connection with the report of the committee of the American Institute of Architects, which committee, while not considering that competition was the best method of securing an architect, still recognized that in a large number of cases it was apparently the only feasible method to adopt.

Before the thirty-ninth annual convention of the American Institute a paper was read by Mr. Robert D. Andrews on

THE LIMITED COMPETITION.

Mr. Andrews said:—

I should like to have it understood at the outset that I am not arguing for or against limited competitions, or any other form of competitions, in the abstract. They exist like any fact of nature. All we may do is to decide how we shall conduct ourselves in reference to them, as we would in reference to sea-bathing or cigarette-smoking or the use of postum.

Abstractly considered, competitions can be neither good nor bad. It is only when we come to particular instances and classes that these terms have any real significance. Things are accounted good or bad according as they accomplish what they are intended to accomplish. Competitions are failures when the purpose of the competition is defeated. A competition is a failure in which the winner of the competition does not become the architect of the building. It is a failure when, as a result of a competition, an unworthy selection is made. Anything that breaks down the competition and prevents its harmonious fulfilment tends to mark the competition a failure.

Causes of Failure.

The causes which lead to the failure of competitions are numerous. Among them may be mentioned the lack of authorization on the part of those instituting the competition to carry out what they imply. Committees who have special powers delegated to them cannot delegate those powers to others, and this has often proved a stumbling-block. Another familiar cause of failure is a contradiction in the terms of competition, as in the matter of cost and accommodation. Everyone probably has had the experience of a competition in which all the drawings were rejected because none of the designs presented could be executed for the cost stated.

Another defect in competitions, which is recognized particularly by architects, is their failure to adequately compensate the services of competing architects. This feature results in the frequent refusal of the best men to compete and the failure of the competition from an ideal point of view.

First-floor Plan.

Ground-floor Plan.

These premises have recently been erected at a cost of about £1,350. The building is faced with local red bricks, the stone dressings being of Denwick stone and the roof covered with grey Welsh slates. The basement provides spacious store-room and good lavatory accommodation. The contractors were Messrs. Summerbell & Son, and the architect was Mr. H. Chapman, A.R.I.B.A., of 12, Grey Street, Newcastle-on-Tyne.

It must be granted, I think, that the majority of competitions are entered upon by promoters in a spirit which merits approbation, their intention being good. The promoter as a rule wants to get what is best for his purpose, and it seems to him that by competition he will have certain advantages for judging what is best that do not present themselves if he employs an architect outright.

Co-operation.

Anyone of experience who views the question impartially will, I think, arrive at

the conclusion that many of the features which have rendered competitions useless, or worse than useless, were due to a lack of sympathetic co-operation between the architects employed and the employer before the terms of competition were decided upon. The most successful competitions in which I have been concerned have been those in which the competing architects have had an opportunity to talk over with the owner (generally a committee) the terms and conditions of competition before these were definitely put into shape.

All the architects concerned in a limited competition have an equal right to assist in the determination of the terms and conditions of competition. They constitute a group to whom a certain specific proposition is made, and as a group it is their privilege and their duty to consider and arrange these terms.

Need for a Definite Contract.

It would be a great advantage, owing to the complex relations of competitions, to have a contract habitually signed by the group of architects on the one hand and the employer on the other. If the signing of such a contract were an habitual thing, the promoter would be obliged to consider whether he were authorized to do the things which the arrangement implies that he will do, and the architects would have a right to demand that he have such authorization. At the same time it would be necessary for the architects to recognize the rights of their fellows in the competition as to the terms, the amount of compensation, and the technical provisions of the programme. In a word, the employment of a contract between the promoter and the architects in cases of competition would make it necessary for all parties to think out with greater clearness the nature of the obligations which they were incurring.

What the Architect strives for.

The opportunity to erect an important building, with all the advantages of money and distinction coming from it, is what an architect strives for in competition. This chance is worth a great deal, and the owner avails himself of the value that architects attach to it by proposing to them that they shall make sketches for this work, with a chance of obtaining it, at a lower rate of payment than is usual and customary in non-competitive practice. In other words, the owner pays the competing architects in part with a chance of getting an important commission. Because he pays them in part with this chance, they agree to lessen the amount of their specific individual payment. It is interesting to observe the value which architects place upon this chance. Let us take as

An Example

an instance in which a 1,000,000 dollars (£200,000) building is to be erected. Nothing is more firmly established than the justice of a 5 per cent. commission to architects for their full services. These services are classed under three heads: first, the preparing of preliminary sketches; second, the making of working drawings and specifications; third, the making of detail drawings, supervision and the care of accounts. For preliminary sketches the charge of 1 per cent. is established, for working drawings and specifications 2 per cent., and for the balance of the work 2 per cent., making the total of 5 per cent. While the amount of draughting involved in the preparation of preliminary sketches is proportionately much less in evidence than in the preparation of working drawings, this fact is due to the rejection by the architect of innumerable studies made by him as a preliminary to the final and presented sketches. It is further to be borne in mind that the sketch of a building, as here considered, contains the germ of the entire structure. It includes what is most significant and original and vital in the architect's work. A fifth part of the whole commission is none too large a charge for this creative work. The main idea of the building is there.

The Justice of this Sub-division of Charges

is generally recognized, an instance of its official recognition being that of the city of Boston, whose Schoolhouse Department specifies as follows in its agreement with architects: "When preliminary studies are completed the value of the architect's services to date shall be reckoned one-fifth of the estimated total commission. When working

drawings and specifications are ready for contract the value of his services to date shall be reckoned as three-fifths of said commission. If the Board discontinues the services of the architect at any intermediate stage, the value of his services shall be reckoned proportionately."

The Argument and its Effect.

Assuming, then, that this subdivision of the commission is justifiable and officially recognized, it would appear that the value of preliminary sketches for a 1,000,000 dollars building is 10,000 dollars. Now suppose a competition were to be instituted for a 1,000,000 dollars building, and the proposal were to ask five architects to compete, and to give the four rejected competitors 1,000 dollars apiece for their drawings, and the successful competitor the award of the work. In any large city of the country five of the best men of the profession would stand ready to accept this offer. In other words, the discount which each makes for the chance of getting the 1,000,000 dollars commission is a discount of 9,000 dollars from a service whose value is 10,000 dollars. As there are four men in the competition who make this discount from their services, it is apparent that the persons instituting the competition receive 36,000 dollars worth of services in exchange for the business chances they control.

Now 36,000 dollars is a pretty large sum, and no business man or group of business men would be content to give out services or goods of that amount without some pretty definite assurance that payment was to be made in return. But architects have never safeguarded the award of a commission for a building in this way, because the interest at stake is a common and mutual stake, and we are as yet too individualistic and uncivilized as a profession to have learned the advantages of professional comity.

My contention is that the present attitude of architects in regard to competitions of this sort is greatly lacking in dignity and self-respect. More than this, I hold that architects by their failure to co-operate and to work together on occasions of this sort are doing a great injury to the interests of the community in which they live. My objection is not based upon the loss of dollars but upon the loss of efficiency.

The upshot of my thinking upon this subject is that we have never adequately realized what I might call the social obligations of competition—obligations which we owe to each other, to the owner, and to the world at large. As we come to realize these fully we come to see that it is not sufficient for us to simply hold these ideals as ethical ideals—ideals which the good will follow and the bad will depart from as they choose; we must go further and insist that the ethical standards be given legal recognition and enforcement.

My proposal would be that the architects in each Chapter of the American Institute agree with each other that they will not enter any limited competition, to which any of the subscribers to that agreement are invited, without first conferring with such invited subscribers as to the propriety of the terms and conditions of competition. This achieved, they will then and there decide upon the form of contract which shall be made between themselves and the parties inviting the competition. But inasmuch as the principles involved in a limited competition are the same wherever the competition is held, however the details are varied, I would suggest that the Institute itself, as representing all the Chapters, secure the advice of counsel upon a typical form of contract to be employed in cases of limited competitions.

There are several things about competitions says the "American Architect," that archi-

itects would do well to remember constantly. First, no one is constrained to take part in a competition: the action is purely elective; but having elected to take part in one, it is foolish to whimper over the manner in which it has been carried out. Secondly, every competition is a success—to the winner and generally to the promoter. Thirdly, there is no single solution, no supreme excellence. There are innumerable solutions of every problem, and the selection of one of them is a mere matter of personal preference either on the part of the promoter or his adviser. It follows, then, that different advisers would be fairly certain to make varying decisions, and hence the storm of abuse that disappointed competitors visit upon the adviser is thoroughly unreasonable. Fourthly, the decision of a competition ought to, and must in certain cases, rest absolutely with the promoter and not with the adviser. This must always be so in the case where the promoter is represented by a committee or commission, since, being merely a delegate body itself, it is powerless to delegate its own powers to anyone else. Hence it is that complaints made against an adviser because in his report he recognizes this fact and so merely "recommends" the adoption of one or another or a combination of one and another design are merely a proof of ignorance on the part of the complainants.

NOTES ON COMPETITIONS.

Holborn's new Council Offices.

The Holborn Borough Council, at its last meeting, had under consideration the objections of several of the six architects who have been selected to compete for the Council's new offices to the clause in the conditions referring to the appointment of the successful competitor. This clause is to the effect that the Council does not undertake to select any one of the architects submitting drawings as the future architect for the work. Some of the objectors very properly pointed out that a mere honorarium was not sufficient inducement to compete, and requested that some undertaking should be given by the Council that the author of the scheme adjudged to be the best submitted would be appointed to carry out the work. The Council, acting upon a recommendation of the Buildings Committee, has agreed to accede to this request subject to the acceptance of any of the plans submitted. This is not satisfactory, and appears to have been so regarded by all the competitors, who sent a joint letter asking for a more definite statement of the Council's position and intention. The reply was to the effect that the Council wished to reserve the power of acceptance; that modifications of the schemes submitted might be required, and the possible, though improbable, contingency might arise of the competitors refusing to make them, in which case, if the Council was bound to make a selection, it would find itself in possession of a scheme which would be undesirable if carried out. Thus the agreement to select an architect from amongst the authors of any plans accepted is practically the same thing as the original condition, where no undertaking is given to select any one of the architects submitting drawings, for the Council does not at this later stage of affairs agree to accept any of the designs. It is a most unreasonable thing to ask competitors to modify their designs after they have been submitted, and it is astonishing that Councillors Doll and Ridge, who apparently are to undertake the responsibility of assessing, did not advise the Council of the obvious and usual course of accepting all the designs as submitted, and judging them upon their

merits and in accordance with the requirements set forth in the conditions. If any modifications were then required they could be made upon the selected design by its author. The successful competitor who objected to modify his scheme would be as rare indeed as a building carried out in strict accordance with a competition design. Further information as to how the majority of the competitors regard the present position of affairs is not at present forthcoming.

Wallsend Municipal Buildings.

The danger of entering a competition where no assurance is given that the author of the design placed first by the assessor will be appointed to carry out the work has been again exemplified by the recent decision of the Wallsend Town Council to adhere to its resolution to appoint the authors of the design placed third as architects for the building. This matter was referred to in these columns on March 21st last, and it was then pointed out that the Corporation, in the conditions of competition, did not bind themselves to carry out any of the designs sent in, or to adopt one of the designs which may have been awarded a premium; only two premiums were offered. Hopes were entertained that Mr. J. H. Morton, the author of the first-premiated design, would succeed in persuading the Council to act fairly towards him, but the Council appears to have been led by the nose by one Thomson, a member, formerly a joiner in a shipyard, now a speculative builder. This gentleman has expressed himself freely upon the artistic merits of Mr. Morton's elevations, which he likened to a Presbyterian chapel built in the middle of a warehouse. And so the layman's opinion has outweighed that of the professional assessor, and another injustice has to be recorded in the black book of competitions that failed. It may be mere coincidence that the favoured architect is a neighbour of the afore-mentioned Councillor with advanced views on design, but the fact does not mitigate the bad impression which has been made upon the minds of all who love fair play.

A Greenock School.

In the competition for Carlsburn School, Greenock, the first place has been awarded to Messrs. Salmon, Son & Gillespie, of 53, Bothwell Street, Glasgow, who have been appointed architects for the work. The premium of 40 guineas is awarded to Messrs. Gall & Anderson, of Aberdeen, and the premium of 30 guineas to Messrs. Cowan & Knox, of Glasgow.

Bangor Library.

Mr. A. E. Dixon, A.R.I.B.A., of Messrs. Dixon & Potter, 65, King Street, Manchester, has been awarded the first premium of £25 in the competition for the proposed free library for Bangor, and Mr. Vernon Hodge, of Teddington, the second premium of £15: 17 designs were submitted. The library is to cost £3,000. Mr. P. C. Thicknesse, F.R.I.B.A., of Liverpool, was the assessor.

Church and School at Wolstanton.

In a competition held recently for a new Congregational church and Sunday school at Wolstanton, Stoke-on-Trent, the design sent in under the *nom de plume* of "Ready" was selected by the architect to the Congregational Union, to whom the designs were submitted for adjudication. The author of this design is Mr. Reginald T. Longden, of Moorland Road, Burslem. The scheme includes a church to seat between 500 and 600, with vestries, organ-chamber, &c., and Sunday schools in distinct departments for kindergarten, primary, junior, intermediate and senior scholars respectively, with twelve classrooms, superintendent's room and library, church parlour and kitchens, &c. The buildings will be of local bricks with cherry-

coloured sand-faced stock facings with wide joints and stone dressings, broadly handled panels of rough-cast being introduced. The roof will be of red tiles. All rooms will have wood-panelled dadoes and plastered wall-surface over, open roofs and green-stained woodwork.

New Schools at Plymouth.

At a meeting of the Plymouth Education Committee held last Thursday the report of Mr. H. Dare Bryan, F.R.I.B.A., the assessor in the competition for new schools at Prince Rock, was submitted. Of the sixteen designs sent in Mr. Bryan placed Nos. 10, 4, 11 and 6 as the four best, awarding the first premium to No. 10 and bracketing Nos. 4 and 11 as equal for the second premium (to be divided). As regards cost, the average estimate of fifteen designs was £15,100, and the estimate of the successful competitor £15,910, for which sum Mr. Bryan considered the buildings could be erected in a substantial manner. In reply to an enquiry addressed to him by the sub-committee Mr. Bryan said: "The estimates of schemes Nos. 4, 10 and 11 are in my judgment practically correct, although that of No. 4 is low for good work. The difference in cost of these schemes is doubtless accounted for by the fact that the author of scheme No. 4 has left the interior exceedingly bare (this is shown by the sections when compared with schemes Nos. 10 and 11) and you would have to be content with inferior finishings. I think it possible that schemes Nos. 10 and 11 might be reduced, say, £500, if strict economy is exercised, but I do not think you would be wise in cutting down below £15,000, and I would point out that the estimates of schemes Nos. 6, 15, 8, 16 and 7 all amount to £16,000 and over."

It was decided to recommend that the design numbered 10 be awarded the first place and premium of £50 (to be merged in commission), and that the plans be adopted for the new schools, subject (1) to the authors reducing the estimated cost to £15,000 and (2) to the approval of the Board of Education; and that the premium of £30 be equally divided between the authors of designs numbered 4 and 11.

The letters containing the names of the competitors were then opened. The authors of the successful design, to which the £50 premium is awarded, are Messrs. Thornely & Rooke, of The Crescent, Plymouth; the same firm of architects being the authors of design No. 11, bracketed with No. 4, sent in by Mr. A. S. Parker, of Plymouth. No. 6 is by Mr. B. Priestley Shires, of Plymouth.

Competitions Open.

The following is a list of competitions open:—

DATE OF DELIVERY.	COMPETITION.
May 5	BRANCH LIBRARY AT SUNDERLAND.—Limited to local architects. Premiums of £20 and £10. Particulars from Mr. John W. Moncur borough engineer, Town Hall, Sunderland.
" 31	NATIONAL CONGRESS HALL FOR BRAZIL.—Premiums of 15,000, 10,000 and 5,000 milreis (equivalent to about £1,685, £1,125 and £562 respectively). 5,000 milreis also for designs not premiated but desirable to be acquired. The conditions of the competition can be seen at the offices of the Commercial Intelligence Branch of the Board of Trade at 73, Basinghall Street, E.C.
No date	DETACHED AND SEMI-DETACHED HOUSES AT CLIFTONVILLE, BELFAST.—Premiums £700. Particulars from R. J. McConnell & Co., 51, Royal Avenue, Belfast.
"	SCHOOL AT BEDMINSTER, BRISTOL, for 1,030 children. Limited to Bristol architects. Particulars from W. Avery Adams, secretary to the Bristol Education Committee, Guildhall, Bristol.
"	ALMSHOUSES AT WAREHAM. Particulars from G. C. Filliter, North Street, Wareham, Dorset.

Views and Reviews.

Crematoria.

Mr. Freeman has written a great deal about crematoria recently, and in this publication he seems to have gathered together all the particulars which have appeared in various places. Doubtless there are many readers to whom a book like this will be welcome. The author deals with all the chief crematoria in this country and abroad, illustrating his remarks by a large number of plans and photographs.

"Crematoria," by Albert C. Freeman, M.S.A. London: St. Bride's Press, Ltd., 24, Bride Lane, E.C.

A new Portfolio of Measured Drawings.

This collection of measured drawings made by students in the School of Architecture at Liverpool University is the first of a new series which it is proposed to publish yearly, somewhat on the lines of the Architectural Association Sketch Book. The collection comprises drawings of four buildings at Liverpool, namely the Town Hall, the House of Providence in Dingle Lane (with its lodge), and two doorways under the colonnade at St. George's Hall. Also the following:—The Petit Trianon and Grand Trianon, Versailles, Dublin Customs House, the Orangery at Kensington Palace, the Senate House at Cambridge, and a Jacobean chimney-piece in Hall-i'-th'-Wood Museum. The majority of the drawings reproduced have, as Professor Reilly states in the preface, come into existence by reason of the requirements from students proceeding to the Bachelor degree of Arts in the Honours School of Architecture at Liverpool University. There is a description of each of the buildings illustrated and also some photographs which are very useful in conjunction with the measured drawings. With regard to these latter, they all seem to be careful enough work, but we certainly do not consider that the reproductions do justice to them. In a publication of this kind, with plates on such a large scale, we look for good reproduction as a *sine qua non*, but nearly every plate in this portfolio has lines broken and blurred, and quite lacking in that crispness which makes a good measured drawing so interesting. Judging from the reproductions, it would seem that the originals presented no difficulty whatever to the lithographers, and we are sorry that the collection should suffer so very much by being inefficiently printed. We understand that any profits made by the sale of the publication will go to a fund to assist students to travel or to undertake special pieces of work.

Portfolio of Measured Drawings. Liverpool University School of Architecture, price 15s. nett.

The Country Gentleman's Estate Book.

In this yearly publication there is always a good deal of information which will interest architects who have to deal with houses in the country. In the present issue there is a short article by Mr. W. G. Horseman on dairy buildings, illustrated with a very useful sheet of a dairy recently built in Hertfordshire; Mr. Charles Carter contributes an article on the ventilation of cottages and small houses, illustrated by several instructive drawings; Mr. Killingworth Hedges writes on the protection of agricultural buildings from lightning; while Mr. H. Munro Cautley, A.R.I.B.A., contributes an article on farm buildings, accompanied by some useful drawings. Other articles deal with a creosoting tank, waterworks for country houses, land drainage, old windmills, and estate workshops. We can recommend the volume to our readers as being well worthy of a place on their reference shelves.

"The Country Gentleman's Estate Book, 1906" Edited and compiled by William Broomhall. London: The County Gentleman's Association, 24 and 25, St. James', S.W.

Norman Architecture in Essex.

Some little time ago we reviewed a book on "Mediaeval Architecture in Essex." Since then this second volume of the same series, dealing with the Norman work in the county, has come into our hands, but in noticing it we are circumscribed by the fact that the author has lately died, and we do not know whether the set of six volumes he purposed to publish will be completed, though we trust someone will carry on this well-begun work. The first volume, which was introductory, merely contained the author's explanation of his *modus operandi*, and told us by what signs of grace the architecture of Essex can be distinguished from that of other counties. Its forest gave us churches of wood in great numbers, but not much use was made of its clay after the Romans left Britain, and for bricks of English make we must look to the thirteenth century. Where there is chalk there is flint of course, as in the neighbouring eastern counties; but since one is too soft and the other too hard, there could be little of ornamental work in either, and Essex depended for that in great measure on such stone as could be imported. (From Caen we had a great deal, conveyed entirely by water, or along the Roman roads from the points nearest France on the South.) This volume dealing with Norman work bears on the face of it signs of its own incompleteness, such as the want of an index, while the somewhat disjointed character of a treatise so brief that no single building (though some are important enough) can be awarded a page to itself, is sure to be noticed. The references we find in the text seem to be in some cases to illustrations belonging to the other unpublished volumes, while some of the illustrations here are left to explain themselves. The accompanying three examples show the character of the drawings given in the book.

"Norman Architecture in Essex," by the late Ernest Godman, architect, Secretary of the Committee for the Survey of the Memorials of Greater London. Published by the author at Sunnyside, Banstead, Surrey.

Notes and News.

In the Rebuilding of Baltimore after the great conflagration which occurred in February, 1904, reinforced concrete is being largely used.

At the Bangor Asylum, near Edinburgh, a recreation hall, to accommodate 720 patients, is to be built at a cost of between £5,000 and £6,000. The architect is Mr. Hippolyte J. Blanc, R.S.A., F.R.I.B.A.

Proposal for a new Exeter Hall.—A scheme is on foot to build as a memorial to the late Sir George Williams, the founder of the Young Men's Christian Association, a hall of considerable pretensions which shall supplant Exeter Hall as the headquarters of the association. The cost is put at £100,000.

New Municipal Buildings for Lancaster are to be erected from designs by Mr. E. W. Mountford, F.R.I.B.A., at the expense of Lord Ashton. The structure will cost about £80,000, and will have a clock tower rising 146ft. above the main entrance in Dalton Square. The dimensions of the building will be 238ft. by 132ft.

A Curious Case.—A penalty of fifteen guineas was recently imposed on Messrs. W. & R. Chambers, of Edinburgh, for building work done without a warrant from the Dean of Guild Court. The omission was occasioned by the death of the first architect and the preparing by the second architect of plans which differed from those of his predecessor.

Hopkinson House—a kind of Rowton house for ladies engaged in professional work—has been opened at 88, Vauxhall Bridge Road, S.W. It is the second of its kind, the first building—Brabazon House—having been opened, close by, in 1902. Accommodation is provided for 139 ladies. Mr. R. Stephen Ayling, F.R.I.B.A., of Westminster, was the architect, and Messrs. Wallis & Sons, of Maidstone, were the contractors.

Mr. Norman Shaw's Design for the Rebuilding of Regent Street Quadrant, in so far as relates to the Piccadilly Hotel front, will be exhibited at the Academy next month. The design is classic in treatment, to be carried out in Portland stone. Above the shops occupying the street level and carried on a series of arches is an imposing colonnade along the upper floors, recessed, with coupled columns. It is stated that the Quadrant on both sides of Regent Street is to come down and to be reconstructed from Piccadilly Circus to Vigo Street. The directors of the County Fire Office are ready to demolish their premises and put up a new block as soon as they can get permission, and Messrs. Swan & Edgar are eager to replace their existing premises by a new structure.

The Newman Memorial Church at the Oratory, Edgbaston, is nearing completion. The nave is now finished. The plan and main features of the church are based on those of the church of San Martino in Rome, chosen because Cardinal Newman had always intended that such a church should be erected at Edgbaston. Certain modifications, however, have been made to suit modern requirements, there being transepts and a spacious sanctuary, while a barrel-domed roof, in sweet chestnut, has been substituted for the flat roof of San Martino. One of the chief features of the interior is a series of six marble columns supporting the roof on each side of the nave. These monoliths have been brought from Carrara and are nearly 18ft. long, with a diameter at the base of rather more than 2ft. The architect of the building is Mr. Doran Webb, and the contractor Mr. Linzey, of Trowbridge. The cost of the work will be about £30,000.

A New Hotel at Aberdeen is to be built at the corner of Market Street and Guild Street at a cost of £6,000. Messrs. Sutherland & Pirie are the architects.

Restoration of Hexham Abbey.—A new nave to Hexham Abbey is proposed to be erected from designs by Mr. Temple Moore at an estimated cost of £20,000.

Messrs. Mellowes & Co., Ltd., of Corporation Street, Sheffield, have secured the order for glazing, on their "Eclipse" patent imperishable system, the roofs of the electric power station at Ilkeston, Lloyd's proving house at Cardiff, the Fairfield Biscuit Factory at Liverpool, and the Coventry Ordnance Works, Ltd., Coventry.

St. Mark's Campanile.—After about two years' work on the foundations, the new Campanile of St. Mark, at Venice, is now about 5ft. above ground. The repairs to the adjoining library of Sansovino are nearly complete and the scaffold is being removed. Repairs are being executed on the opposite side of the Piazza, arches and vaulting being shored up, whilst the whole is being thoroughly overhauled.

Reconstruction of Sheffield County Court.—The county-court buildings in Bank Street, Sheffield, are at present undergoing almost complete transformation. The scheme provides for a new public office on the ground floor, quarters for the high bailiff and his staff in the basement, and a commodious registrar's court on the first floor. The plans have been prepared by Mr. H. N. Hawks, of H.M. Office of Works, and the work has been entrusted to Messrs. Ash, Son & Biggin, contractors, of Sheffield.

A New Central Fire-station for Dublin is being erected in Brunswick Street, from designs by the City architect, Mr. C. J. McCarthy. Its most striking feature is the tower, 120ft. high. In the construction and equipment of the station Irish materials are being extensively used. The lower storey of the main building to a height of about 17ft. is built of limestone from the Milverton Quarries, near Skerries. The rest of the walls is of red brick from Portmarnock. The roofing is of Killaloe slate. The builders are Messrs. Donovan & Sons, of Dublin. The total cost will be about £22,000.

New Parcel Post Office, Glasgow.—All the stonework of this fine new building, now nearly completed, is being treated with a preservative solution to enable it to withstand the Glasgow atmosphere. It is a freestone from Northumberland. Steel case-ments are used in the windows, and stone and steel emergency stairways in case of fire are provided. Although the building is only of three storeys, it rises to a general height of 91ft. above the street level, this being accounted for by the sorting halls requiring a height to the ceiling of 25ft. The total cost is £80,000. The architect is Mr. Oldrieve, of H.M. Office of Works.

The new Bridge across the Thames at Vauxhall is to be opened next month. Its total length is 759ft. The central span is 149ft. 7ins., with a headway of 20ft. above high water, the two intermediate spans 144ft. 4½ins. wide, with a headway of 19ft., and the shore spans 130ft. 5½ins. wide, with a headway of 14ft. 11ins. The width between the parapets is 80ft., of which 50ft. is occupied by the carriageway and 15ft. on either side by the footways. Down the centre runs a double line of tramways. The bridge is the joint design of Mr. Maurice Fitzmaurice and Mr. W. E. Riley, F.R.I.B.A., respectively engineer and architect to the London County Council. It was illustrated in *THE BUILDERS' JOURNAL* for May 20th, 1903.

An Illuminated Fountain—"the largest and finest in the world"—has been constructed on the Schwarzenbergplatz, Vienna, one of the most beautiful spots in the city.

Crowland Abbey in Danger.—The buckling of the north wall of Crowland Abbey necessitates its immediate underpinning and the rebuilding of the north window.

Summer Palace for the Khedive.—M. Korber, a Geneva architect, has been commissioned by the Khedive to build a summer palace on the western shore of the Bosphorus, at a cost of about half a million.

Manchester Society of Architects.—The forty-second annual report of the council has just been issued, and will be presented to the annual general meeting to be held to-morrow (April 26th). The present membership is 223.

Change of Address.—Mr. Thomas Moody, F.S.I., has removed his offices from Cockspur Street to No. 2, Haymarket S.W., the premises Nos. 29 and 30, Cockspur Street having been acquired by the Cunard Steamship Co. for their new building site.

Subsides in the Temple.—Two large blocks of buildings in Essex Court and Plowden buildings, Temple, have recently shown signs of subsidence, and builders are now at work shoring them up and reconstructing the outer walls. The buildings were erected in 1667.

An Old French Dormer Window, dating from the time of Francis I. (1515-1547), is now to be seen in the North Court at the Victoria and Albert Museum, South Kensington. The gift of Mr. J. H. Fitzhenry, it is from the Château de Montal, a ruined manor-house situated on the high ground overlooking Saint Céré, in the Department of Lot. Next to this window is the upper part of another, evidently dating from the same period, as the crowned salamander in flames, which forms so striking a piece of ornament on this pediment, was a favourite device of Francis I. Below is placed a portion of an arch-soffit from the Château de Bonnavat.

Glasgow Institute of Architects.—The annual general meeting was held last week. Mr. John Keppie, F.R.I.B.A., the retiring president, in his valedictory address, stated that although the scheme for amalgamating the Glasgow Architectural Association with the Institute had not yet been formally carried out, he hoped the matter would be completed at an early date. The council for the ensuing year was elected as follows:—Messrs. A. N. Paterson, John Keppie, H. K. Bromhead, James Lindsay, T. L. Watson, James M. Monro, Alexander M'Gibbon, Andrew Balfour, Charles Gourlay, Thomas Baird, jun., R. D. Sandilands, George Bell, Alexander Skirving, Robert Miller, John B. Wilson and H. E. Clifford. Mr. James M. Munro was elected as the new president and Mr. George Bell as vice-president.

The new addition to the Glasgow Stock Exchange, which has been in process of erection for some time, was opened last week. Above the ground floor, which is fitted up as a post-office, is the first or principal floor, which comprises the new mining market, telephone corridor and smoking-room. The new market is about 52ft. by 42ft. by 22ft. in height, and is lighted by three large windows from St. George's Place. The telephone corridor gives ample accommodation for the large number of boxes required, and will eventually enter to the main staircase in the present building and be more than 100ft. in length. The second floor is principally occupied by the offices of the secretary, while the telegraph department has been placed on the third floor and the extensive clearing house on the fourth. Mr. John James Burnet, of Glasgow, was the architect.

Enquiries Answered.

The querist's name and address must always be given, not necessarily for publication.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Correspondents are particularly requested to be as brief as possible.

Chimney Construction.

Messrs. Heinrich Winby & Co., of 20, King William Street, London, E.C., write as follows: "We read your correspondent's enquiry on p. 212 of your issue for April 18th as to whether a flue can be introduced into a chimney at a height of 20ft. above the ground, and whether a large opening in the circular brickwork at such a height is not detrimental to the stability of the structure. As specialists in the construction of chimney shafts, may we say that this has been done without impairing the stability in many cases, though it would be wrong to answer the question in the affirmative in a general way. It is, of course, too much dependent upon the general circumstances of the case, of which we have no knowledge. The only way to solve the question would be by exact science, i.e., to tackle it from a statical standpoint, examining how much will be the pressure exerted on the remaining part of the brickwork at the juncture of the opening, and to design the thickness in accordance with the result. The calculations must, of course, consider the wind-pressure also, for which in this country 56 lbs. per sq. ft. of vertical projection should be allowed. It will be obvious that the quality of the bricks and the mortar is not without influence."

Thickness of Walls under L.B.A.

HAMPSTEAD.—H. W. S. writes: "Is there a formula for obtaining the thickness under the London Building Act of a wall of given height and length?"

There is no formula for obtaining the thickness of walls under the London Building Act. Some of the annotated editions give tables and diagrams, and this is the nearest approach that can be made to a formula.

HENRY ADAMS.

Extras on a Contract.

SOUTH WALES.—CONTRACTOR writes: "Kindly advise me as to the legal position of a builder who has exceeded his time in the completion of a contract, but in connection with which a certain amount of extra work has been done. The usual clause about the architect having the power to order these extra works was included, also the stipulated amount of damage for any delay, and that all questions relating to the contract were to be decided by the architect. I have been perusing the report of *Dodd v. Churton* in the Court of Appeal ('Law Times' Reports, March 19th, 1897). In that case it seems to be laid down clearly that where extra works are ordered and done the time clause is nullified. Is this so?"

If the additional works have been such that they constituted serious and considerable extra works the contractor will be entitled to some time allowance; but if the extras only constituted a small part of the whole, and such as might naturally and reasonably occur on such a contract, their addition will not form a valid basis for the waiving of the time-limit. I believe a court would probably decide such a question purely as a matter of reasonableness.

F. S. I.

Renaissance.

YORKS.—W. S. A. writes: "What is Renaissance style? Are the following buildings of this style:—(1) St Paul's Cathedral; (2) City of London School; (3) Natural History Museum, South Kensington; (4) Houses of Parliament; (5) Hatfield House; (6) Ingestre Hall, Staffs; (7) Kirby Hall, Northants?"

You evidently do not possess the most elementary knowledge of architectural history, and we therefore advise you to study any of the history books, such as Banister Fletcher's.

Rights of Adjoining Owners.

PERPLEXED writes: "A put down a pocket for a clothes-post in some vacant moorland at the side of his house. C and B, adjoining owners, pulled it up three times. The post was used about three hours on two days a week for hanging clothes, the lines being fastened from the post to the corner of A's property and being taken out of the ground when not in use. A and B have, presumably, acquired a right-of-way over the land, having used it for about forty years. Was B right in pulling up the pocket? Also, in the event of A buying a piece of the vacant land in front of B, could he erect a post and rail fence similar to and of the same height as B's boundary fence; or if not, could he buy and erect a fence, as shown by the accompanying plan (not reproduced), which would not then project over B's cottages, but would be in a line with the cartway? Do a clothes-post and two lines of clothes constitute an interference with right of light or way?"

A was undoubtedly committing a trespass when he placed the pocket on the "waste of the manor" as shown on the sketch. Whether B was entitled (as frontager) to remove it depends on circumstances, but if his access to his cottages was obstructed by the post or the clothes-lines, he was, I believe, justified in his action. Your sketch is not at all clear as to the means of approach to B's houses. The lord of the manor cannot sell any portion of the moor except subject to any rights, easements or privileges—public or private—that may attach to it, and if B possesses the right of passing over the vacant land in question the purchase of the freehold by A will not affect the matter in any way.

F. S. I.

Building on Made Ground.

WORKS writes: "In the accompanying rough sketch (not reproduced) it will be seen that the ground between the X's was recently made up, and when about to build on the plot it had to be overcome. I had this excavated 8ft. to a solid bottom, and at the positions marked X ran up cavity walls. In the positions where the 4½in. cross partitions come I put a bressummer from wall to wall, A to A and B to B, with stanchions under, fixed substantial joists at right angles to these and bearing on the cavity walls, and in place of 4½in. walls on these joists I erected a skeleton partition and filled it with brickwork. The chimney-breast I brought up from the bottom of cellar. My opponent says this is silly and wasteful construction, and his method would be to excavate the loose ground to the wall A A, battering back the remainder or shoring it up, building the cavity wall at that point, and allowing the loose ground to be put back or to remain behind it. At the opposite side he would excavate the loose and solid ground to the outside wall marked W and run his cavity wall up there, and I presume bring his breasts and other 4½in. wall up from the bottom of the cellar."

It appears from the description given that a depth of 8ft. of made ground was excavated and cavity walls carried up to ground-level, though why cavity walls does not appear. Then bressummers were put across

a span of 22ft. over the excavated area to carry two 4½in. brick-nogged partitions. No mention is made of the number of floors or what the partitions carry, nor what the scantlings of the bressummers were. Stanchions were put under the bressummers, but it is not stated how many there were nor their size and positions. In view of the meagre information given and ignorance of the nature of the premises it is impossible to say whether this was "silly and wasteful construction." The planning at any rate is peculiar.

HENRY ADAMS.

Bending Moments of Fixed Beams.

Referring to the enquiry on p. 178 of THE BUILDERS' JOURNAL for April 4th, a correspondent writes: "The bending moments of built-in beams can be obtained in many cases by a very simple process. In these beams there are generally two kinds of bending moments, namely, those producing compression in the upper part of the beam and those producing tension in the upper part. Now the sum of the bending moments producing the compression must equal the sum of those producing the tension, and, further, the sum of the maximum of both kinds (neglecting the algebraic sign) must equal the maximum bending moment, supposing the beam to be simply supported. Taking the case in question, the sum of the areas of the triangles with the close shading should equal the area with the more open shading. The bending moments at the fixed points are each 19'79ft.-tons, and the bending moment between the loads is 5'2ft.-tons."

Thickness of Walls for Underground Septic Tanks.

KENDAL.—STUDENT writes: "The accompanying drawing (not reproduced) shows the arrangement of five septic tanks 9ft. long by 32ft. wide built in concrete. The tanks are filled and emptied by the inlets and outlets, there being a continual flow through the tanks. The 24in. wall at the inlet end is proposed to be constructed to form part of a sludge well, and the other walls will be practically underground (sand and gravel). Kindly show me by an ordinary formulæ if the thickness of the walls as proposed is strong enough to withstand the pressure. If not, would arched buttresses placed at intervals between the two end walls be sufficient?"

The wall at the sludge well end of the tank is shown on querist's sketch as consisting of two 18in. concrete walls, with a space of 2ft. between, occupied by buttress arches at intervals. This will be sufficiently strong if the arches are not more than 8ft. apart. For the other two external walls supporting the pressure of the internal earth the thickness at the top should be 18ins. and at the bottom not less than 2ft. 6ins. the battering faces being on the inside of the tank. The fourth wall which separates the tanks should be made 18ins. thick at the top and 3ft. 6ins. thick at the bottom, with both faces battering. If one tank is likely at any time to be empty and the adjoining one full, then the division wall should be made 18ins. thick at the top and 4ft. 6ins. thick at the bottom.

HENRY ADAMS.

Reinforced Concrete.

CEMENTATION writes: "In constructing a building of this material on one of the many systems now in the market, does the architect or the patentee design the work? Who is responsible for the strength, the architect or patentee? If the patentee designs and is responsible for the building, where does the architect's fee come in?"

The design is generally prepared by the specialist firm engaged. The architect is the agent of the owner to plan the building and supervise its construction, for which he receives his fees.

Adjoining Owners and Eaves Gutters.

HEREFORD.—H. S. writes: "I have had a complaint from an adjoining neighbour about wet coming into his premises from my roof. My building has been erected thirty years or more. My neighbour erected his building against mine about nine years ago, and as he could not interfere with my ancient eaves gutter he built around it. Who is responsible for the damage caused, and had my neighbour a right to build in such a manner?"

Your neighbour cannot blame you for the dampness, as he has made it almost impossible to repair your gutter. The circumstances you mention he probably had no right to build in the peculiar manner he appears to have done, and you are in a legal position, even now, to make it exceedingly unpleasant for him. I advise you to tell him so, and to refer him at once to your solicitor should he press his complaint further.

F. S. I.

Constructing an Attic.

EAST HAM.—S. S. writes: "Is it possible for me to build a small attic in the roof loft of my own freehold house, the joists to run independent of the ceiling roof from parting wall to wall? Also, can I open the roof so as to allow of an attic window? Should I be breaking any by-laws by doing so?"

If your house is in a district having by-laws in force, it would be well that you should obtain a copy of them. Then, recollecting that an attic counts as an additional storey, you could easily ascertain whether or not your proposed additions were in accordance therewith—the points practically needing attention being "thickness of walls" and "air-space." Personally I fear that you will have considerable difficulty in conforming to by-laws under the conditions that subsist in your case.

F. S. I.

Flow of Sewage in Pipes.

WHITEHAVEN.—R. S. writes: "Kindly inform me whether the following formulæ are worked out correctly. They are for a sewer proposed to be laid with 6in. steel pipes. Total length of sewer 1,300ft., fall 13ft. The formulæ are calculated for running three-quarters full:— $v = c \sqrt{R \times 2H}$.

v = velocity in ft. per min. R = hyd. mean depth. H = fall in ft. per mile.
 c = an empirical constant value 55.
 $D = v \times A$. D = discharge. A = sec. area of pipe.

$v = 55 \sqrt{112 \times 105.6} = v 55 \sqrt{118272} = 55 \times 3.43 = 188.65$ ft. per minute.
 $D = v \times A = D = 188.65 \times .1964 = 37.0508$ cub. ft., or 231 gallons per minute."

The approximate flow in a circular pipe running partly full may be found by Eytelwein's formula $v = 55 \sqrt{H/2f}$, where v = velocity in ft. per min., H = hydraulic mean depth in ft. = sectional area of flow in sq. ft. divided by wetted perimeter in ft., f = fall in ft. per mile. The length of pipe does not come into the calculation as the friction is allowed for in the formula. In the case of a 6in. pipe running $\frac{3}{4}$ full, i.e., $\frac{3}{4}$ diameter of pipe, and falling 13ft. in 1,300ft., the first thing will be to find H from the area of the segment occupied by the water, and the wetted portion of the circumference, both very awkward calculations for so small a pipe; then the fall in ft. per mile, which will be $\frac{13 \times 5280}{1300} = 52.8$. It will be very

much simpler to take the pipe as running full (when $H = \frac{1}{4}d$) and then make any desired allowance off that. It will then be

$55 \sqrt{\frac{1}{4} \times 2 \times 52.8} = 200$ ft. per min. for the velocity and $0.5^2 \times 0.7854 \times 200 = 39.27$ cub. ft. for the quantity flowing per minute. The calculations submitted are correct, but the value of H is apparently taken from a table.

HENRY ADAMS.

Law Cases.

Chimneys.—At the Clerkenwell County Court recently the case of *Box v. Wallace* was heard. The claim was for £21 13s. 9d. as damages for alleged breach of contract. Plaintiff's case was that in the erection of a number of his houses defendant, instead of building the chimneys in swan-neck fashion, had allowed the masonry to project at right angles. The consequence was that the chimneys could not be swept, and the amount claimed was what had been expended by plaintiff in putting them in such a condition that they could be swept. Defendant said he built the chimneys according to the plans and specifications. The judge found for the plaintiff.

Contractor's Claim for £9,000 against the War Office.—Mr. A. R. Stenning sat at the Citadel, Plymouth, for several days last month as arbitrator in the dispute between Mr. Henry Kerswell, contractor, of Plymouth, and the Secretary of State for War in reference to the building of barracks and recreation block for the Royal Artillery at the Citadel. Upwards of £9,000 was claimed. The claimant's case was that he had been made to do a great deal of work not set out in the quantities or the plans, work which was in the plans and not in the bill of quantities, and other work which (said counsel for claimant) might, perhaps, by a stretch of imagination be said to be in the quantities but not fairly or properly and adequately described therein. The facts appear to have been as follows:—In 1896 plans for the buildings in question were prepared for the War Office by Mr. Kitsell, and contractors were invited to tender, but not Mr. Kerswell. None of the tenders sent in, however, were accepted, and in June, 1897, Mr. Kerswell was invited to tender for the work, and his tender, amounting to £22,844, was accepted. A greater part of the claim arose out of what claimant contended was extra work. Mr. Kerswell had placed before him twenty-one drawings on September 8th, 1897, which he was called upon to sign, and copies of which were handed to him as the drawings from which he had to execute the work. Although these drawings were placed before Mr. Kerswell as the drawings from which the bill of quantities had been prepared, he contended they were not such, but that in some way, which he was unable to explain, the drawings had either been altered or new ones had been prepared between the preparation of the dimensions and the bills of quantities, which were got out early in 1896. At the time of Mr. Kerswell's tender the ground was covered by old ramparts and buildings, and it was impossible to say whether the land was level or not. As soon as the old buildings were taken away it was discovered that the land was not level, and the levelling of it necessitated very considerable extra work. Much extra work, too, had been incurred in the finishing of limestone. The contractor in the ordinary course would be required only to leave a smooth margin to the stone, or, at the most, only a little tooling, but in this particular case he was called upon to put fluted stone throughout the buildings. After the work was completed Mr. Kerswell made out an account, and there arose disputes between him and the War Office as to whether he was to receive payment for what he claimed as additional and extra work. After a time some official at the War Office suggested that to settle the matter it would well if an arbitrator were appointed between them. Mr. Stewart was accepted as arbitrator, but it subsequently turned out that the War Office did not in any way treat Mr. Stewart as arbitrator. Mr. Stewart held an enquiry in Plymouth during October, 1902. Mr. Kerswell and his surveyor, Mr. Corderoy, were under the impression

when Mr. Stewart opened the enquiry that he was going to sit as arbitrator, but they were shortly disabused of that idea, because when Mr. Stewart was asked what his authority actually was he informed them that he was not there as arbitrator; he was there as agent for the War Office to make enquiries and report to the Secretary of State for War. Mr. Stewart reported that £3,243 19s. 11½d. was due to Mr. Kerswell. In consequence of what happened Mr. Kerswell came out poor; as a matter of fact, he had to make an arrangement with his creditors, and he hoped as a result of this enquiry that he was going to receive something which would enable him to make a fresh start.

Obituary.

Mr. James Ronald, builder and ex-bailie, of Stirling, died on April 12th, aged about 70.

Mr. W. Goldsmith, A.R.I.B.A., F.S.A., architect, of London, E.C., died recently, aged 49.

Mr. W. G. Bartleet, of the firm of Messrs. William G. Bartleet & Son, architects and surveyors, who died on March 10th last, aged 77 years, left estate valued at £86,015 gross.

Mr. Robert A. Bryden, architect, has just died, after some months of failing health, at the age of 64. He was a native of Glasgow, where most of his works remain to adorn the city. He had just attained to his professional jubilee. His chief works are the large buildings in Bothwell Street known as the Christian Institute, Quarrier's Homes (a town in itself), the new Maternity Hospital, and a hospital in the Isle of Man. He was a member of the Glasgow Institute of Architects and an F.R.I.B.A.

Mr. William Frame, A.R.I.B.A., architect to the Marquess of Bute, died recently at Cardiff, aged 58. He commenced his career in South Wales in the office of Mr. Pritchard, diocesan architect of Llandaff, and had a share in the building of the spire of the cathedral there. He then took a position under the late Mr. Burges in London, and went down with him to Cardiff when the late Marquess of Bute decided to restore Cardiff Castle and construct the clock tower. When Mr. Burges died Mr. Frame became private architect to the Marquess and continued the restoration of the castle and its historic Roman surroundings. He had, with Mr. E. W. M. Corbett, much to do in connection with the reproduction of the north gate, which is now nearing completion. Mr. Frame's work for the Bute Estate was not, however, confined to South Wales. He spent a good deal of time in Scotland, where he designed and superintended some important works for his lordship, among them being the restoration of the House of Falkland. He was also the architect for the restoration of Castell Coch, the old Welsh stronghold which guarded the Taff Valley near Tongwynlais. The Bute offices on the pier-head at Cardiff were also designed by him.

The Institute of Hygiene, Lima, Peru, is planning the establishment there of a permanent Health Exhibition, with a view to instructing the Peruvian public in the latest methods of hygiene, sanitation, &c. The Institute would be glad to receive samples or printed descriptions of such articles as disinfectants, hospital equipments, &c. An Italian bacteriologist, Dr. Ugo Biffi, is the director of the Institute, which is under the City government. The Institute is prepared, within certain limits, to defray the cost of carriage of samples forwarded.

CONCRETE-BLOCK ARCHITECTURE.*

By Louis H. Gibson.

I COULD never have hesitated long in accepting the cement-block idea. I have hesitated long, however, in agreeing to accept cement blocks as at present manufactured. I have recognized the inherent merits of concrete construction, and from the beginning have felt that making concrete in block form was a worthy building and commercial enterprise, but I have never seen an artistically successful structure executed with cement blocks, and, until recently, I have felt that I could not encourage this industry. I am doing it now in this way, not because of any decided encouragement through specific results, but on account of what I recognize as a possibility. I know that a worthy cement block can be made commercially. My conviction rests upon the well-known and well-recognized merits of concrete as a building material and because it is desirable to fabricate it into block form. It is difficult to form concrete along proper architectural lines into structural and decorative shapes, such as monolithic walls, columns and lintels. The block machine is the logical former of concrete for building purposes. Concrete will come into structural and decorative use largely through the agency of the machine.

Why the Architect stands off.

But architects are unfriendly to the concrete block as now made. Is this because the architect is unfriendly to concrete? I answer this question by asking another: Who has been more ready to use concrete as a structural medium than the architect? The architect wants to use the concrete block. He is always looking for a new medium, and when manufacturers realize the possibilities of the material he is ready to use it.

The most successful terra-cotta concern in the world makes the most artistic forms. The most prosperous pressed-brick makers in America make the most artistic brick. They have certain stock patterns, well designed, which a self-respecting architect is not ashamed to use. They will make what he wants, but if he has not time to wait for the new designs there are often those in stock which he does not hesitate to employ. The architect uses stone, terra-cotta, brick, and he uses them in block form. He is not using concrete in this form. This is the fault of the block-maker and not of the architect. As now made, he is afraid of it structurally and decoratively, and doubtful of the general capacity of the manufacturer to carry out his plans.

The Mistaken Idea about Mixing.

The modern alchemist who would turn sand and cement into gold must first learn how to make concrete. Block-makers and cement-workers generally are lamentably ignorant of this fundamental operation. The impression has got about that a labourer who is not fit for anything else can mix concrete, that the cheapest labour one can employ is good enough for this work.

Before we get through with our block business we are going to grade our sand, we are going to know that the voids are reduced to a minimum before the cement is introduced, and we will thoroughly mix the sand and the cement in the dry before the water is applied. Most cement-workers believe they are already doing this. Their wrong belief is the source of the trouble. It is the cocksureness of nearly all that is the real stumbling block. Block-makers particularly have been educated by the machine salesmen that any old thing can mix concrete. When we learn to mix concrete we can hope to

make the impervious block. Cement-makers, as a class, have done their work well and scientifically. They have availed themselves of all of the resources of science, and it appears absurd that this work should have stopped with the making of the cement. The chemist, the engineer and the cement-maker have joined hands in the mixing of concrete. In the making of blocks they have parted company.

We may take lessons from the modern mechanical mortar-maker in the mixing of the aggregate in concrete. He dries his sand and mixes it mechanically. The makers of bitulithic pavement have reduced the grading process to a science, and on that account are reaching a large measure of success. We may study a modern asphalt plant with profit.

Sand must be Clean.

yet most cement blocks that I know anything about are made of dirty sand, and most of the blocks that we see are dull, heavy, lifeless, and leaden in colour and texture. This can be obviated by clean sand and a proper proportion of cement of the right kind.

We will mix our aggregate with more water than has been common with most of us. We will experience troubles from crazing, hair-cracking, if we do not take advantage of our opportunities. The cause of this trouble from cracking suggests its own remedy. It is the relatively neat cement on the outside of the block, the difference between the composition of the surface of the block and the interior—a difference in contraction. If our blocks are of the right composition we may wash them and we may cover them with damp cloths while they are setting. We may rake them over with a fine-toothed tool. We may give them a texture with a wire brush. The man of resource, keen perception and artistic insight will find many ways of getting around this difficulty.

Texture.

The principle involving the production of proper texture is not difficult to understand when we analyze it. We want cement enough, certainly not too much. We know that we want it evenly distributed. The nearer we can come to exposing the sand on the surface the better. Those of us who can remember the lost art of old-fashioned hard-finished wall-plaster know what this means. With a brush and water the plasterer washed out all superfluous lime, and up to a certain point the more lime he washed out the harder and stronger, brighter and crisper, he got his plastering. This principle may be applied to the surfacing of cement blocks. In one way or another we shall wash out the neat cement. Unless the proportion of sand and cement be uniform, the texture will not be uniform. The best bricks that are now made for decorative purposes, for facing, are not intensely smooth. They have a grain—a texture, we call it. The surface is gritty; it has somewhat of a sand-paper quality; it receives the light in a pleasing way.

What Manufacturers will have to do.

An influential cause for the feeling which architects have about the cement block is the difficulty of having their plans exactly carried out. There is too much cut-and-dried business. The architect or the builder is not going to submit to compromises in one material that he does not have to submit to in others. In terra-cotta, stone and brick all plans can be carried out to a nicety, and there are no advantages otherwise in the concrete block which will lead to a compromise in its favour. The setting plans of a stone-cutter and a terra-cotta worker are marvels of neatness, exactness and accuracy. Great buildings are built practically without the sound of the hammer. Certainly the work is fitted before it leaves the cutting

shed or the factory. There is no reason why this should not be done in the same way by the block-maker. It must be done or the block business will not succeed.

There is no excuse for ugliness on the ground of cost. Good proportion costs no more than bad proportion, harmony of colour costs no more than inharmony: there is no more expense of material or labour in a well-formed moulding than in an ugly one.

It will be necessary for you to employ artistic designers who can design for you certain relatively simple standard designs which may be readily adaptable for various purposes. This is eminently a practical thing to do, and it must and will be done if the block business is to reach any large measure of commercial success.

The cement-block machine may produce and reproduce artistic forms for the masses. It may give us beautifully decorated structures at a minimum of cost. Art should be for everybody, and the block-machine should be a great art democrat.

A FORTY-STOREY SKYSCRAPER.

TOWERING far above the highest of New York's skyscrapers will soon be seen the new Singer building, the home of the Singer sewing machine. The structure will be built at the north-west corner of Broadway and Liberty Street, and will rise to a height of 593ft. above the pavement. (The highest point of the Cathedral of Cologne is 515ft.) It has been the aim of the Singer Co. to have the tallest building in the world, and it was with this object in view that the architect, Mr. Ernest Flagg, prepared the plans, naming forty storeys as the greatest height to which he could carry the structure with safety. Comparing it with other skyscrapers, it is nearly two-thirds as high again as the Park Row building, which is the tallest building in New York to-day, containing twenty-nine storeys and reaching to a height of 382ft. above the street.

Numerous other structures that will materially change the present skyline are also under way, or contemplated, in the immediate vicinity, but although most of them are larger buildings not one of them is to be as high as the Singer building. The two tallest are respectively twenty-eight and twenty-nine storeys.

The new structure is an L-shaped annex to the present Singer building. The foundation will be of reinforced concrete construction, supported on reinforced concrete piles, and the superstructure will be made as light in weight as possible consistent with the required strength. The exterior will be of pressed bricks, with limestone dressings.

Perhaps the greatest of the many difficulties with which the architect had to contend was that presented by the elements. A building of this height, standing alone, must be well braced to withstand the onslaught of the terrific gales that frequently pass over the city. The oscillation must be reduced to a minimum. This is accomplished by means of an elaborate system of wind-braces or large triangular sheets of steel which are placed in the angle formed by the intersection of each girder with the steel columns, which braces are securely riveted to both girders and columns, forming a thoroughly rigid mass that will resist any wind-pressure. The plans are now completed and in the hands of the building department, and it is expected that within two years this tallest of skyscrapers will be completed.

The Castle of Christiansborg, Copenhagen, which was destroyed by fire twenty years ago, is to be rebuilt for use both as a Royal palace and a Parliament House. The architect for the work is M. Thorvald Jorgensen.

* Extracts from a paper read at the convention of the National Association of Cement Users, at Milwaukee, Wis., U.S.A.

THE ARCHITECT AND THE CRITIC.

"ARCHITECTURE," the critic pronounces, "is dead. It is not any more a living art. It is a sort of man millinery—little better. The 'Ladies' Home Journal' tells my women-folk that skirts will be cut full this spring, or after the pompadour manner, and can I not see by the common practice that cornices are heavier this year and worn lower; the colossal order is in vogue, and so forth? Do not tell me that the modiste and the architect do not meet on a common ground. Architecture is defunct." This may be so, says Mr. H. W. Desmond in the "Architectural Record," of New York, for April. "On consideration, however, I ask how can I be sure of it, for the practice of architecture or the attempt to practice it continues. Indeed, with the critic's speech,

and the tone of it ringing in my ears, I can almost with greater certainty bring myself to the belief that the defunct one is criticism. Yet, I know that conclusion is not true either. The very bitterness of the reproach against modern architecture indicates reaction. The dead do not indict the dead. But the phenomena remains—the architects on one side, the critics on the other. And the separation itself is not the deplorable aspect of the situation. The dark side of the opposition is the indifference, the real indifference, of the critic to all the architect does or tries to do. And, on the other hand, we have to lament the complete apathy of the architect towards well-nigh everything the critic can conceivably say—except praise, and that he may lay on with a trowel.

"But what of the critic's credentials? Whose utterances are worth the reading? Besides,

as one well-known architect said recently: 'We've no time to read. All we need is pictures just to see what the "other fellow" is up to.' The man who spoke thus was not entirely fair, even to himself, but the fact remains that the critical body is so small, so withdrawn, so utterly 'in opposition,' it is impossible to produce sufficient testimony to establish indubitably the exact whereabouts of the 'critical position' in regard to the mass of contemporary architecture."

London—A City of Architectural Scraps.

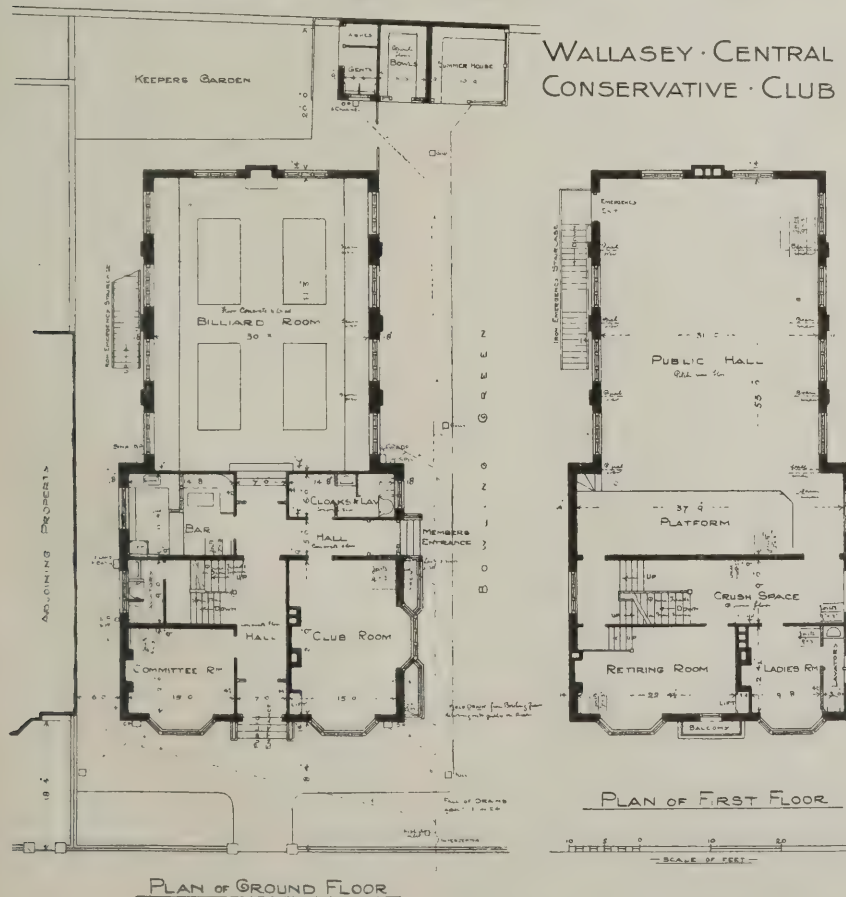

As an appendix to the foregoing we give the following criticism of new buildings in London which appeared recently in the "American Architect":—

The new War Office has lost its outer garment of scaffolding, and we may now examine it. Curious it is that, in spite of half a century's ridicule lavished upon the dome and "pepper-boxes" of the National Gallery, that same style of architecture should return to us. The new Admiralty rejoices in a dome, St. Paul's in miniature, and pepper-boxes; the new War Office has only the latter, two storeyed square turrets upon the circular base of the rounded corners of the building. The principal doorway is mean; the "ornament" in the semicircular pediment, the royal arms! A row of columns upon the first storey is presumably an effort to bring the new work into harmony with Inigo Jones's fine fragment hard by.

Now may we not wonder why Jones's plans for Whitehall Palace were not utilized, at all events for the façade? Surely the interior of the building might have been adapted to modern uses? It is a pity. The Banqueting Hall stands out nobly as a dignified building—grand in its simplicity. With the exception of the Foreign and Home Offices, which are also excellent specimens of simple dignity, the whole of the Whitehall buildings leave London where it was—a city of mere scraps architecturally.

Along the Strand hoardings still prevail. We wander up a street named Aldwych, between desert wastes. The Crescent is but a roadway. The Gladstone memorial is jammed against Wren's old church of St. Clement Danes, presumably that it may not be in the way of cars and omnibuses. The church of St. Mary-le-Strand is divested of so much pavement that it seems to have been shaved off on each side. A few trees would correct this; but trees would interfere with traffic. Alas, will the improvement of London never be a properly organized scheme? Paris years ago determined how to develop itself; London is all haphazard—tinkering; it is characteristic of the British race. In France everything is a well-studied organization; in England, the last new idea of the newest in office, just what may be best for the time being. However, after foreign travel, all Englishmen and women rejoice when they return to their haphazard manners of luggage management. In France, everywhere on the Continent, half an hour often does not suffice for claiming luggage. Here it is chucked out of a van, we poke it with our umbrellas, a porter picks it up, it is lifted into a cab, and off we go in three minutes! And the marvel is we never lose it—we may miss it, but it always turns up. Blessed methodless land! But luggage is not architecture.

Extensions to the Blackpool Sanatorium were opened recently. They provide considerable additions to the administrative block, a new pavilion for patients accommodating twenty-two beds, a double isolation block, and new laundry. The walls of the wards are finished in Keene's cement and Ripolin paint. Warming is by Shorland's Manchester grates. Laundry machinery has been supplied by Messrs. Summerscales & Sons, Ltd. The architect for the extensions was Mr. F. T. Waddington.

This building is being erected in Manor Road, Liscard, Cheshire, from designs by Mr. Leonard J. Hughes, architect, of 10, Victoria Street, Liverpool, the contractors being Messrs. Joshua Mills & Sons, of Liscard. The cost is put at £2,705. One of the chief features of the plan is the possibility of letting for public purposes part of ground floor and the whole of the first floor, second floor and basement, when not in use by club members, without disturbing the privacy of the billiard-room, clubroom and bar. This can be attained by simply locking the door between the public and the members' entrance halls. The building is kept to one end of the site, the remainder being laid out as a large bowling green.

R.I.B.A.

Two Papers on Plasterwork.

A MEETING of the Royal Institute of British Architects was held at 9, Conduit Street, W., on Monday evening, the chair being occupied by Mr. Edwin T. Hall, vice-president.

The deaths were announced of Mr. Robert Alexander Bryden, Fellow, elected in 1878, and Mr. William Goldsmith, Associate, elected in 1882.

Two papers on "Plasterwork" were then read by Mr. G. P. Bankart and Mr. Laurence A. Turner.

Mr. Bankart's Paper.

Mr. Bankart said that plaster had so long been looked down upon for its modern commonplace vulgarity of treatment that it seemed almost incongruous to think of it as a vehicle of art. Any really healthy revival seemed only seriously possible by again reverting to the beginnings, by the gleanings of some of that simple impulse which urged the artists of the past to find expression in materials and methods most in sympathy with their own nature, and in their right and full development.

What, the author asked, are some of the abstract points of value to be gathered from a general rumination amongst all the accumulated wealth of the labour of men's hands in the application and shaping of a kind of mud in or on buildings; and what may we rightly take to heart in pursuing or in attempting to give fresh hope and vitality to modern plasterwork? The shadow of the first half of the first century A.D. revealed to us remnants of modelled wall and ceiling decoration of a beauty subtlety and delicacy never since surpassed or even approached. It spoke to us of the extraordinary decorative instinct of the Greek and Roman in the combination of extreme simplicity of line and surface with refinement and power of execution. For the plasterer the lessons to be learned from these fragments of decorative art can never be too plainly noted or too highly praised. The stucco of the Romans tell us of their investigation, their admiration and of their imitation. This imitation was not the copying of the form, but of the spirit, of the art of the ancient Romans and Greeks. We of the twentieth century have our own religion, our science, our folklore, our national virtues, our industries and manufactures, to embody in our art.

Plaster in Renaissance Times.

Tracing the history of the plasterer's art through Renaissance times, and speaking of the results brought about by the changes in building construction, the author demonstrated that each one of these developments had its marked effect upon the decorative art of the plasterer. From each of these stages it would be found that the plasterer produced his best work when the particular kind of plaster he used, whether stucco, parge or plaster-of-Paris, was worked in its own particular plastering way, and was not forced into simulation of carving in marble, stone or wood. The success of his art seemed best assured when his material was put to the fullest right use without abuse.

To the question, Did the Classic or the Renaissance architect consider whether the methods then employed were legitimate or no? the author was inclined to suggest the negative, but that they were accepted as the most convenient and durable methods of expression then known. The primary object of the decoration of a ceiling or of a wall, as in all decoration, was the giving of pleasure to the eye. The construction of the ceiling had undoubtedly its bearing on the design, but once the impression of sufficient support and strength satisfied the artist, he vied in his emulation to obtain the praise of the

patron (eager to outshine his rivals); and to do this, while framing his work with due respect to reasonable economy, he thought chiefly of his enrichment, treated in the language of the time. This point concerning right or mistaken method, whether past or present, had an important bearing on all workmanship. Had the artists of the Italian Renaissance known of the method of casting

From Moulds of Flexible Gelatine,

the author thought that they as artists would have carried their method to a much greater pitch of perfection, and not so much in mechanical skill as in suiting their forms more particularly to the advantages of the mechanism. He claimed for plaster at least that respect and technical liberty which is due from the artist to any other material or medium of expression, whether the surface of operation be large or small. He believed each period of the art of the plasterer should be regarded on its own merits in combination with the peculiar circumstances and efficiency or inefficiency existing, according to the peculiar materials that it was then most convenient to procure and to manipulate. If mechanical skill be the plasterer's diploma, then should the twentieth century be able to dim the glories of the Italian Renaissance; but we must go back again to simplicity of line, of form and of spirit in the giving of pleasure with our money's worth. If this object is unattempted and unaccomplished, or undesired, by the lack of desire or knowledge of the sense of beauty on the part of the people and of the worker, then the world will be so much the poorer by ignoring not only the art of the plasterer but all of the lesser arts.

Mr. Turner's Paper.

Mr. Laurence A. Turner took for his subject "Decorative Plaster Ceilings," which he divided into two broad divisions—lime-plaster and plaster-of-Paris. These two materials, he said, required widely different methods in their use. As to which gave the most satisfactory plasteresque result there could not be two opinions. Lime-plaster must take the first place, and ceilings in this material must be modelled *in situ*. The quality we should try to reproduce in plasterwork is that which we find in the Elizabethan and Jacobean lime-plaster ceilings. These form the best models and standard of work for the art. Most are of lime-plaster; but there is no reason why the same effect should not be produced with plaster-of-Paris. The chief quality that made the old plasterwork so charming was the exceedingly soft, delicate and subtle play of light and shade that was produced on its modelled surfaces. In modern work it is the hardness of line and sharpness of shadow, dead flatness of the unornamental surface, that make it so dreadfully dull. The most satisfactory results in any plaster-decoration we possess are those in which there is no undercutting except in detached ornaments. Therefore it is necessary, in modelling a ceiling, to avoid all undercutting, hard edges and rigidity of line. Court everything that is the reverse of these qualities—softness, rounded contours, soft shadows, breadth of surface and extreme modulation of line and surface. Plasterwork worthy of the name must have

The Quality of Softness.

Every atom of it should be modelled. There should be a subtle play of light and shade all over it; the plain spaces as well as the mouldings and foliage should be alive with delicate modelling, and not dead and cold like the early Victorian ceilings. With the many new methods and materials discovered since that Utopian period for plasterers between 1400 and 1600, what can be done, the author asked, to produce a fine, satisfactory, decorative result at a reasonable cost? To make a ceiling nowadays in lime-plaster, using only the methods that those

old people used, it is useless to imagine that anything can be done that is not very costly. Besides, the difficulty of obtaining the properly slaked lime renders it almost impossible to model the plaster with the fingers. Tradition says that twenty years was not an out-of-the-way time for the lime to be slaked before use. The author advised the use of Keen's cement if well-slaked lime was not procurable. In ceilings he had

Modelled in situ,

in which Keen's cement had taken the place of lime; he had always mixed silver sand and size with it, the latter to prevent the cement from setting too quickly. He did not personally incline to the method of modelling in plaster *in situ*. He preferred to model the ceiling on the bench, in Keen's cement and sand, and to use his fingers only. When the model is finished a mould of plaster or gelatine is made from it, and the work cast in fibrous plaster. If there is a doubt about the amount of relief required, it is easy to offer up a cast *in situ*, and there is the advantage of being able to repeat the pattern instead of having to model the whole ceiling. Another advantage is that, by using sand with the cement, one can by using a coarser sand, and more of it, prevent the work from becoming too small in detail or too elaborate in finish, for the material will not allow of it. Another

Advantage of Fibrous Plaster

over lime is that the ceiling is three or four times lighter, and will not crack or fall, as the lime-plaster on laths sometimes does. The author confessed his partiality for ribbed or panelled ceilings, the method of construction of which he described in detail. Their beauty is chiefly dependent upon the modelled effect they should possess, the ever-varying play of light and shade of a most subtle kind. Very great care must be taken in modelling the plain ground for this type of ceiling, as the richness of effect is chiefly dependent upon it. The practice of using moulded wooden ribs, dividing up a ceiling into panels and painted white to appear like plaster, he strongly deprecated. It had the result of bringing a ceiling down and making it look heavy, whereas a well-modelled ceiling of plaster does the reverse, making the room look lighter and giving a sense of greater space. The ceilings of Wren's date, although very beautiful, depend upon their design for their beauty, and not upon that quality which is peculiar to plasterwork. They might equally well have been carved in wood or plaster. The Adams ceilings, made, the author believed, entirely from carved-wood moulds or carved wooden model, are hard and uninteresting, though very refined: they depend for effect entirely upon their design, and not upon modelling.

With regard to the question as to how far the architect should supply drawings for a ceiling, the author thought that nothing more than a small-scale drawing indicating the type of work he required should be given to the modeller; more than that only hampered him. The architect should supervise and criticize the models.

The author, in conclusion, emphasized his view that if a plasteresque effect be wanted the whole ceiling should be softly modelled, mouldings as well as ground; but if that was not to be, then let it be, frankly, carving produced in plaster.

A vote of thanks to the readers of the papers was proposed by Prof. Baldwin Brown, seconded by Mr. W. H. Atkin Berry and supported by the chairman, and Mr. Bankart and Mr. Turner replied.

It was announced that the annual meeting would be held on May 7th, and that a special meeting would be held on the same date to pass a resolution enabling the president and council to retain office until after the International Congress of Architects.

Tenders.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, Great New Street, Fetter Lane, E.C. Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Birmingham.—For additions to premises in Caroline Street, for Messrs. Goodman, Ltd. Messrs. Ingall, Son & Mitton, architects and surveyors, 3, Temple Row West, Birmingham. Quantities by Mr. J. Percival Bridgwater, quantity surveyor, Queen's Chambers, Colmore Row, Birmingham:—

J. E. Harper	£3,365	15	0
T. Loud & Sons	3,297	0	0
T. Mills & Sons	3,270	0	0
A. J. Teall	3,200	0	0
J. Dallow & Sons	3,184	0	0
W. J. Whittall & Son	3,149	0	0
W. Harvey Gibbs*	3,015	0	0

* Accepted.

Birmingham.—For heating apparatus at the Baptist Mission Hall, in Hope Street. Messrs. E. Stanley Mitton & C. Silk, joint architects, 3, Temple Row West, Birmingham:—

Parker Winder & Achurch, Ltd.	£158	15	0
The Jevoon Co., Ltd.	146	0	0
Benjamin Parker, Ltd.	138	0	0
G. N. Haden & Sons*	128	0	0
A. J. Kallaway	98	0	0

* Accepted.

Breinton.—For alterations and additions to Breinton Manor House. Messrs. Groome & Bettington, architects and surveyors, Palace Chambers, Hereford:—

H. Smith	£1,674	0	0	£35
W. Rowbery	1,649	6	3	40
W. Powell	1,597	0	0	28
W. Bowers & Co.	1,498	0	0	22
C. Cooke	1,470	0	0	20
R. L. Friend	1,497	0	0	25
W. C. Bolt	1,400	0	0	25
E. W. Wilks,* Hereford	1,380	0	0	45

A.—Extra for granite plaster.

* Accepted subject to modifications.

Dartmouth.—For the erection of two shops and dwelling-houses in Victoria Road, for Mr. W. H. Brown, Dorchester. Mr. Montague Luke, architect, Studio Royal, Dartmouth, and at Plymouth:—

R. Watts	£1,785		
D. T. Pillar	1,730		
A. E. Knight,* Summerland Terrace, Dartmouth	1,685		

* Accepted.

Ilstock.—For the erection of a Council school, for the Leicestershire County Council Education Committee. Mr. W. M. Cowdell, architect, Grey Friars, Leicester:—

F. Elliott	£4,119	0	0
E. Haycock & Sons	3,960	0	0
W. Crane & Son	3,960	0	0
Bowles & Son	3,958	10	0
Haskard, Rudkin & Beck	3,868	0	0
E. Orton	3,868	0	0
T. A. Wileman	3,825	0	0
T. Barker & Son	3,700	0	0
C. Wright	3,694	10	0
Griffin Brothers	3,649	0	0
T. Hickman	3,634	0	0
W. Moss	3,634	0	0
W. F. Harding,* Loughborough	3,610	10	0

* Accepted.

Leyton.—For the erection of U.M.F. schools and alterations to existing church school. Messrs. George Baines & Son, architects, 5, Clement's Inn, Strand, W.C.:—

C. J. Sherwood	£1,731	0	0
C. North	1,492	7	0
W. Manders	1,450	0	0
Sands & Burley	1,345	14	6
Battley, Sons & Holness	1,237	0	0
F. J. Coxhead,* Bulwer Road, Leytonstone, E.	1,172	18	0

* Accepted provisionally.

London, N.—For the erection of new additions at St. John's Road Workhouse, and extension of Guardians' offices, St. John's Road, Upper Holloway, for the Guardians of St. Mary, Islington. Mr. W. Smith, architect, 63, Chancery Lane, W.C.:—

Reason	£21,958	0	0

F. & H. F. Higgs	22,760
Holloway Brothers	22,570
Lawrance & Sons	22,217

London, E.—For rebuilding mill house at the Bow Brewery. Mr. Herbert Riches, architect, 3, Crooked Lane, King William Street, London, E.C. Quantities supplied:—

F. J. Coxhead	£2,250
G. Barker	2,239
Kirk & Kirk	2,100
F. & T. Thorne	2,100
Todd & Newman	1,949
J. T. Robey	1,933
Courney & Fairbairn	1,925
J. Jarvis & Sons	1,884
Perry & Co.*	1,865
W. Irwin	1,777

* Accepted (shortest time).

London, E.—For repairs and decorations to shop premises, Bromley-by-Bow. Mr. Herbert Riches, architect, 3, Crooked Lane, King William Street, London, E.C.:—

T. S. Elkington & Sons	£139	10	0
T. Osborn & Sons	114	0	0
G. Barker*	99	0	0

* Accepted.

London, N.—For repairs and decorations to "The Prince Albert" public-house, Hoxton. Mr. Herbert Riches, architect, 3, Crooked Lane, King William Street, London, E.C.:—

J. T. Robey	£286
F. Parsons & Sons	285
T. Osborn & Sons	236
A. W. Derby	209
T. S. Elkington & Sons*	165

* Accepted.

London, E.—For repairs and decorations to "The Nag's Head" public-house, Poplar. Mr. Herbert Riches, architect, 3, Crooked Lane, King William Street, London, E.C.:—

A. W. Derby	£507	0	0
T. Osborn & Sons	447	0	0
J. T. Robey	444	0	0
T. S. Elkington & Sons	430	10	0
G. Barker*	415	0	0

* Accepted.

Nottingham.—For the erection of dye-house, brown and sorting-rooms, &c., at Albany Works, Carlton Road, for Wright's Finishing Co., Ltd. Mr. Harry H. Goodall, architect, Parade Chambers, South Parade, Nottingham:—

F. M. Thompson & Sons	£939	0	0
G. A. Pillatt	889	0	0
G. Hopewell & Son	872	16	0
J. Hutchinson & Son	835	0	0
W. Maule & Co.	814	0	0
T. H. Harper,* Carlton	810	0	0

* Accepted.

[Rest of Nottingham.]

HALL'S

SANITARY WASHABLE DISTEMPER

The Modern Wall Covering.

The most popular wall covering of to-day is Hall's Sanitary Washable Distemper. It works easily, sets hard and dries with a uniform surface, equal to flatted oil paint.

It is made in 73 colours, including rich dark as well as light shades.

One cwt. of Hall's Distemper mixed with water to the consistency of cream, will cover double the surface of one cwt. of pure White Lead Paint and save 40 per cent. of the cost of labour.

"Sisco" White Japan is the correct material for painting Doors, Picture Rails, and all Woodwork of rooms decorated with Hall's Distemper. "Sisco" Japan is a pure white decorators' enamel, which dries with a hard smooth lustrous surface. It lasts for many years with beauty unimpaired.

Samples and full particulars on application to
SISSONS BROTHERS & Co., Ltd.

Electrical Notes.

The Architect and Contractor in relation to Electrical Work.

Nowadays both the architect and the building contractor are forcibly concerned with electricity in one form or another, the architect more especially in respect of providing for electric lighting or ventilating, and the contractor in respect of the same and also of the uses to which electric motors can be put in the driving of hoists, mortar mills, &c. Yet both seem to keep themselves but little informed of what progress is being made in the electrical trade. The architect may have read a text-book or two, years old most probably, and thereby he thinks himself sufficiently well up in the subject, while the contractor's knowledge is picked up from hearsay and a little experience. The architect having now to make provision for so many new things in his buildings, it is not to be expected that he can possess any deep knowledge of the various specialist trades working under him, but he should more often try to learn from these specialist firms what may be useful to him in another building. As it is, he may provide for electric lighting in a hundred houses, and yet know nothing about the subject. The contractor, on the other hand, being so accustomed to steam and hand-driven machines, rather looks upon electric motors as something fanciful and not to be depended upon; he is, however, being forced from that position, and every year sees the increasing use of motors for such work. And thereby hangs a tale.

Suitability in Electric Motors.

The most suitable types of electric motors for various machine-driving were dealt with recently by Mr. W. A. Ker in a paper which he read before the Institution of Engineers and Shipbuilders in Scotland. Dealing with

reversing motors, which are seldom required to make lengthy runs in one direction, but are nearly always desired to run for a short time and then stop and reverse (as with hoisting gear and cranes), he said the shunt motor had an advantage over the series motor, and the best type to adopt was one with the fields permanently excited; though it was true that some machines having moving parts with but a small inertia, and requiring often to work with a small load when an increased speed of running with a fair acceleration was desirable (such as a jib crane with empty hook), might with advantage be fitted with series motors. He considered the following to be the most suitable:—Radial drills, shunt wound, variable speed; planing machines, compound with fly-wheel (a resistance might be automatically switched into the shunt circuit to increase the speed on the return stroke); punching and shearing machines, compound with fly-wheel; band, cold and frame saws, and wood planers, shunt; circular-saws, compound with small fly-wheel to assist motor when saw meets knots in wood; mortar-mills, compound with fly-wheel; mortising and tenoning machines, shunt; 3-motor travelling cranes, series in shops where rough work is carried out and great nicety of handling is not required. Most electric hoists and lifts are fitted with balance weights equal to the combined weight of the cage and half the ordinary load to be lifted. This enables a small motor to be used and ensures economy in current consumed. It is evident that, with a half-load in the cage, the motor can have no work to do, except to overcome friction, and if a series motor were used it would run at a very high speed and there would be considerable difficulty in stopping the cage at the right place; hence, a compound motor is most suitable for this work.

Life of Electric Lamps.

A great deal has been written about the life of both incandescent gas mantles and incandescent electric filaments, the deductions in the majority of cases being governed largely by the particular view of the writer, whether a partisan for gas or electricity. In the "Electrical Review" for April 6th, however, a very instructive, though short article, appears, setting forth the results of a series of tests made by Mr. Lancelot W. Wild. It is evident, he says, that owing to the deterioration of illuminating value that takes place almost from the commencement of the life of an incandescent lamp that it would pay to scrap lamps at a very early age were it not for the cost of renewals. For determining what was the economical time of scrapping Mr. Wild carried out a series of life tests on forty-eight 200-volt 16-c.p. incandescent lamps of twelve different makes, four lamps of each make being taken. They were tested under average working conditions with the following results:—At the commencement they gave 16·7-c.p. on a consumption of 59·8 watts, being 3·58 watts per c.p.; after 100 hours the c.p. had gone down to 15·9 and the wattage increased to 60·6; after 500 hours the figures were 13·15 and 58·5 respectively; after 700, 12·25 and 58·0; after 900, 11·55 and 57·6; and after 1,000 hours 11·3 and 57·4, these last figures representing a wattage of 5·08 per c.p. Taking the cost of lamps as 10d. each as a basis, and plotting the figures determined in the form of curves, it was found that the correct scrapping points were as follows:—

Price per unit.		Useful life.
1d.	- - - -	1,000 hours.
2d.	- - - -	500 "
3d.	- - - -	500 "
4d.	- - - -	450 "
5d.	- - - -	400 "
6d.	- - - -	350 "

EDINBURGH ARCHITECTS AND THE NEW ART SCHOOL.

THE annual meeting of the Edinburgh Architectural Association was held last week, Mr. H. O. Tarbolton, F.R.I.B.A., president, in the chair.

The chairman of the Committee of Management reported that 1907 would be the jubilee year of the Association, and it had been suggested that the event should be celebrated by holding an exhibition and inviting the Royal Institute of British Architects to hold their annual dinner and other meetings in Edinburgh that year.

Mr. Hippolyte J. Blanc, R.S.A., was appointed president for the current session, and Mr. J. T. Baillie and Mr. W. T. Oldrieve were elected vice-presidents.

Mr. Tarbolton, in his valedictory address, said that matters dealing with the training of the architectural student had been very much influenced by recent events and possible forthcoming changes in art education in Edinburgh. The proposed new Municipal Art School was matter for congratulation, and with it would be introduced, he hoped, a new era of art activity. The foundation of this school would be a task that would demand the most disinterested and anxious attention on the part of the municipality, and he hoped no steps would be taken without consultation with acknowledged experts in architectural training. He maintained that the teaching throughout should be of a synthetic nature, *i.e.*, that there should be common groundwork. Painters, sculptors, decorators, designers and architects should have a definite and common basis of training, for he was convinced by so doing the student would be enabled to discover his real vocation. He thought, of course, that

practising architects should be, as far as possible, on the teaching staff. He would also strongly advise that opportunities should be given to advanced and successful students to continue in the school as pupil-teachers. A school established on the above lines would give a very thorough and general training, and would lay a sound foundation on which the student might continue his studies in later years.

Prof. Baldwin Brown, in moving a vote of thanks to Mr. Tarbolton, said they would like to see architecture taught in the school according to a proper system, and that the whole decorative arts should be grouped together under architecture and looking to architecture as their head. He should very much rather there was not a Committee of Management at all, but that there was placed a thoroughly competent architect, familiar with all decorative arts, as the head of the school, with a free hand to organize it and to gather round him those helpers whom he felt would be of advantage for his work.

Coming Events.

Thursday, April 26.

SOCIETY OF ARCHITECTS.—Mr. T. R. Croger on "Shakespeare and Old London," at 8 p.m.

MANCHESTER SOCIETY OF ARCHITECTS.—Annual general meeting.

THE BUILDERS' JOURNAL

AND ARCHITECTURAL RECORD.

April 25th, 1906.

CONTRACTORS' SUPPLEMENT (MONTHLY).

HOW TO BECOME A BUILDER.

By F. HIGGS (of F. & H. F. Higgs).

WHAT is it to be a "builder"? I do not refer to that product of the present day, the very modern limited liability company, often colossal in the size and scope of its operations (but always impersonal and to some extent irresponsible), in connection with which one cannot tell who is who; but rather I am writing of the expert craftsman whose duty and pleasure it is to crystallize into fact the artistic ideas and dreams of the architect and designer, and who is himself to a growing extent the colleague and fellow-worker with these artists rather than their servant.

As understood at the present day, a builder is one who undertakes works comprising the trades of excavator, bricklayer, mason, carpenter and joiner, ironsmith and founder, plasterer, plumber, and zinc or copper-smith, glazier, painter and decorator. Some knowledge of each of these trades is required if a lad is to become master of his business.

The Training of the Future Builder.

The youth who has this life-task before him must obviously begin it early; his school work should, if possible, be directed with this ultimate goal in view. I am aware it is often very difficult to thus predetermine the career of a young lad. Some show early in life a predisposition to one or other occupation, while others have no particular fancy. If a lad of the latter description has the good fortune either by birth or training to possess the genius of perseverance and a practical cast of mind, he will have a very fair chance of becoming a good builder.

Recalling my own schooldays, I have often regretted that so much time was spent upon classical studies, and have wished that I had learned more Euclid and mathematics. This apparently useless work was of value doubtless from the point of view of mental discipline, but I believe it would have been better had that discipline taken the form of mathematics and technical and mechanical matters.

Given, therefore, a sound practical education in such of the rudiments and principles of knowledge as will enable the youth to shape his future practice and conduct, let him as early as possible put himself apprentice to a master in trade whose business is not so extensive as to preclude his personal attention to its detail, or so engrossing as to prevent his doing what he can for his pupil.

In the Shop.

The term of his apprenticeship should be at least five years, or if he begins at fourteen, which I think the proper time, then seven years. He should spend the first two years of his time in the joiners' shop, during which he should have mastered the principles of framing, the use of the commoner tools, and be able to himself set out and put together an ordinary window and door; and if he can prevail upon the foreman to let him assist in setting-out the shop work, so much the better.

In the Office.

The third and fourth years of the term should be spent in the office to get himself acquainted with the routine of builders' bookkeeping, which, properly kept, should clearly show the out-of-pocket cost of every contract punctually up to date. An intimate acquaintance should here be gained of the prices of materials, and the causes and probabilities of the fluctuation of the same. If the master can see his way to entrust the pupil at this stage to keep the detail cost of the output of the work from the joiners', masons' and smiths' departments, then the experience so gained will prove invaluable in his future career.

Some knowledge of another branch of office-work must also here be gained, viz., the extremely important one of estimating, both upon quantities provided and from drawings and specification.

Presuming that our pupil has all the time zealously set himself to work by "scorning delights and living laborious days," he will have acquired some knowledge of his craft, but, as he himself will be the first to admit later on, very little of what the stern discipline of life and everyday experience will eventually force upon him.

Evening Schools.

He will at the same time be well advised to spend laborious nights as well as days, by attending one of the many technical schools or polytechnics now established on every hand, so that the theory of building construction may be acquired as well as the practice thereof, and the principles grasped of geometry, perspective, land surveying and mensuration, all of which are extremely useful in after-life, besides being sometimes necessary.

Then there are the principles of architecture, its various forms and orders, of which the builder should have some knowledge if he is to hold his own in his future dealings with architects.

One Year upon a Building.

The final term of apprenticeship—viz., one year in the case of a five years' total and three in the case of one of seven—should be spent upon a building. This is really the most useful and satisfactory portion of the period; and if our young friend is inclined to work hard, and is endowed with powers of observation and capacity for management, he will learn more in this section than in either of the previous two, particularly if, having proved himself worthy of it, his master is able to give him some amount of responsibility, and to a youth of capacity the more the better.

Usually he is placed as the job clerk or assistant to the foreman, acting also as timekeeper, and thus he will get some insight into the very important business of the organization of labour and the management and treatment of our friend the British building trades workman, than whom, speaking generally, it will be difficult to find a more sterling example of British pluck, capacity and patient endurance.

As a Foreman.

Perhaps before the period is closed the pupil will have engendered so much appre-

ciation and confidence in his master's mind that he will be entrusted as sole foreman to carry out some job, and in this case the saying will be amply fulfilled that "to him that hath shall more be given," and he will find that the solution of the difficulties and questions that are constantly arising will teach him more than he could possibly learn in any other way. He will also be gradually acquiring knowledge and experience of the various materials used in the building trade, whose name is legion, particularly in the matter of timber, and will be able to judge between good and inferior qualities. He will also, being observant and statistically inclined, keep account of the various labour costs of the work done under his supervision, and the results thus obtained will help him immensely when, later, he is estimating on his own account. In ascertaining these results he will need to be constantly measuring up the work done from time to time, and thus get accustomed to rapid measuring and calculation and at the same time discover on a sure basis which workmen are doing their duty and which should cease to be employed. He will also be able to discover by comparison with the bills of quantities whether the quantity surveyor has taken sufficient, and whether he has properly represented the work to be carried out. Further, if his master, being a wise man, has given him his quantities priced out, he will learn what prices are paying ones and what require revision in future estimates. All these points he will find invaluable to him in his future career.

Knowledge of Quantity Surveying.

Then when the quantity surveyor comes on the scene to adjust variations, or to measure the whole if it happens to be a job on a schedule, he will in his attentions and explanations be able to learn more of the principles of quantity surveying than a whole course of teaching at a County Council building school would afford, and he will see before him the actual items of material and labour which are taken up, according to the London custom, and the reason for their inclusion in a builder's estimate.

Of course, a young man in a position of this sort will make mistakes; as someone has said, "He who never made a mistake never made anything." Most employers rightly think that these mistakes with their accruing experience are made at their expense, and this is true, but full-blown foremen make blunders too, which also occur at the employer's expense, but the added zeal and enthusiasm of the young man makes up for a good deal.

The Premium.

Most builders of standing of course require a considerable premium for an apprentice to their whole trade, but nothing that is worth having can be had without paying for it, and in all cases the premium is returned several times over in salary. It is desirable in the early stages of the term that this salary should be calculated at an hourly rate, to stimulate regular and punctual attendance at duty. Progress, however, depends entirely upon the character and capacity of the pupil.

Commencing Business.

The young man having now served the full end of his term will be wise to stay a while longer if possible with his employer, to gain added experience before starting in trade for himself; and having thus become qualified so far as possible he may by the aid of friends open up some premises and commence business. He will find that he will learn more in one month in this new sphere than in twelve when he was working for another person, but his success will depend upon many things besides the knowledge of his trade, *e.g.*, prudence, foresight, capacity for management, ability to take large views as well as to attend to details, suave and conciliatory manners and address, and, above all, common-sense. If he does his work conscientiously and well, and gives satisfaction to the architects he works for, besides pleasing the person for whom he is building, he is sure to get on, as there is no better advertisement than the good opinion of one's clients and customers.

Capital is of course Necessary,

but provided a business is based on right principles, commercial as well as moral, assistance of this kind will soon be forthcoming; and presuming our young friend is of the thrifty sort and allows the bulk of his profits to accumulate, he will soon find his circumstances taking on a more easy complexion; but let him not imagine that any success can be attained without strenuous and untiring exertion. He must give his whole time and attention to his business, and he will then prove the truth of the Wise

WAREHOUSES AT DAVIS' WHARF BERMONDSEY, ADJOINING TOWER BRIDGE.

King's observation: "Seest thou a man diligent in his business, he shall stand before kings."

A STEEL-FRAME WAREHOUSE.

WE publish two illustrations showing the erection of a steel frame warehouse for Messrs. Leach and Co., Ltd., on a wharf on the Thames adjoining the Tower Bridge, namely, Davis' Wharf, Bermondsey, S.E. As this warehouse is used for storing all sorts of goods the loads on the floors are heavy, and in the warehouse itself have been calculated for a dead load of 3 cwts. per ft. super., while the balconies and the quay have been calculated to carry a live load of 3 cwts per ft. super. As regards the factors of safety adopted, the beams have been calculated for a maximum working stress of 7 tons per sq. in. The total weight of the steelwork is about 650 tons. The detail view shows very good types of connections, and also illustrates the manner in which the intermediate wood joists have been connected with the steel main beams. The foundations of a building adjoining the river naturally require considerable care, but in this case there was no particular trouble, as the old wharf wall still existed. The foundations for the stanchions consist of concrete and steel joist grillages, there being about 87 tons of steel joists under the stanchions and walls in the foundations. The general view shows one-half of the job which has already been completed and is now in use, and the portion still in course of erection. The steelwork has been executed by Messrs. Measures Brothers, Ltd., of 53B, Southwark Street, S.E., and reflects considerable credit upon these well-known iron and steel contractors and engineers. The builders are Messrs. Dove Brothers, Ltd., of Islington, while the architects are Messrs. Stock, Page & Stock, F.F.R.I.B.A., of 9, Denman Street, London Bridge, S.E.

STEELWORK AT DAVIS' WHARF BY MEASURES BROTHERS, LTD.

[Photos: Argos.]

Tenders for the new Wesleyan Hall at Westminster, to be erected on the site of the old Aquarium, are to be invited as soon as the ground is cleared. It was felt desirable to clear the ground before asking tenders for foundations, in order that contractors might know what they had to deal with. Tenders for the clearance of the site were obtained from seven or eight firms and the work awarded to the lowest tenderer. The architects of the building are Messrs. Lanchester & Rickards, of Vernon Place, Bloomsbury.

THE GREAT EXCAVATION FOR THE PICCADILLY HOTEL, LONDON. WILLIAM WOODWARD, F.R.I.B.A., AND WALTER EMDEN, JOINT ARCHITECTS.

Photograph taken on March 28th, 1906.

THE PICCADILLY HOTEL.

IN this issue we give the first of a series of photographs which we propose to publish showing the erection of the large new hotel—the Piccadilly Hotel—which is being erected at the Circus end of Piccadilly, London. Work on the clearance of the site, which was formerly occupied by St. James's Hall and Restaurant, was commenced several months ago. The view on the preceding page shows the vast excavation which has been made. This excavation goes down to 28ft. below the Regent Street level and to 33ft. over the general area. The hotel will have three storeys below ground—hence this immense excavation; yet it will be noticed in the photograph how even deeper places

are being dug out for motor rooms, heating chambers, &c. The brickwork, as shown, is up to ground-floor level on the front to the Quadrant, built round cast-iron stanchions, a detail view of one of which is illustrated: the construction is extensive, but so far presents nothing unusual in building work. The joint architects of the hotel are Messrs. William Woodward and Walter Emden, of London, though the elevation of the hotel to the Quadrant is the design of Mr. R. Norman Shaw, R.A., whose advice was sought on behalf of the Crown, the ground landlords. Messrs. Perry & Co., of Bow, are the builders. The Piccadilly elevation of the hotel was published in THE BUILDERS' JOURNAL for February 8th, 1905, in which issue will also be found some particulars of the accommodation to be provided. Altogether, including site, the cost of the undertaking is likely to be more than a million pounds sterling.

Builders' Notes.

The Congress of the International Association for the Testing of Materials will be held at the Palais des Académies, Brussels, from September 3rd to 8th next.

Builders' Accident Insurance.—The annual report of this company states that the policies in force show an increase over 1904. The decrease in revenue is mainly due to the shrinkage in the wages returns upon which premium is paid; a fact which all conversant with the state of the building and kindred trades during the past year will appreciate. The amount paid in respect of claims shows a decrease, while payments in respect of law charges, commission and cost of management show corresponding reductions. The amount of funds at the end of the year was £22,364, as against £19,669 at the close of the previous year.

Yorkshire Builders, &c., on District Councils.

—In the district council contests in Yorkshire the following gentlemen associated with the building and allied trades have been elected:—Mr. W. S. Farnell, timber merchant, for Birkenshaw; Mr. J. Turner, contractor, for Holmfirth; Mr. A. Waugh, contractor, for Ilkley; Mr. J. Broadbent, joiner, for Luddendenfoot; Mr. J. Maud, timber merchant, for Mytholmroyd; Mr. C. J. Foster, builder, for Normanton; Mr. F. Ratcliffe, contractor, for Oxenhope; Mr. C. Whiteley, builder, for Rishworth; Mr. F. Cowling, joiner, for Silsden; Mr. T. Turner, architect, for Silsden; Mr. T. Duckett, contractor, for Skipton; Mr. A. Marshall, builder, for Soothill Nether; Mr. H. H. Hall, architect, for Soothill Upper; Mr. S. Smith, stone merchant, for Southwram; Mr. A. Carr, builder, for Wheatley.

Collapse of a Wall at Shoreditch.—One man was killed and two men were injured by the collapse of a wall of a building in Rivington Street, Old Street, Shoreditch, on Thursday morning last. Bricklayers were at work on the building, which was being converted into an electric sub-station. Two men named Alexander and Gathercole were on a scaffold, facing a wall with glazed tiles, when suddenly the wall fell outwards, bringing down the scaffolding with it. A third man, an Italian, who was working on the ground, was overwhelmed in the debris. He was conveyed to the Mildmay Mission Hospital, where, shortly after noon, he died from his injuries. Gathercole and Alexander, who were both cut about the head, were taken to St. Bartholomew's Hospital. Gathercole was discharged in the course of the day, and Alexander is making good progress towards recovery.

Toronto Building Boom.—Provided there are no labour troubles, the building trade of Toronto is expected to be good for this and next season, because of the absolute necessity for many more houses, and also because of the many new warehouses, offices and public buildings to be erected under contracts already made and authority secured from public bodies. Regarding the probable outlay on these buildings, a prominent Canadian architect says a conservative estimate is 12,000,000 dollars (£2,400,000).

Bankruptcies.

[Abbreviations: R.O.—receiving order; P.E.—public examination; C.C.—county court; O.R.—official receiver; Adj.—Adjudication.]

DURING THE WEEK ending April 20th eleven failures in the building and timber trades in England and Wales were gazetted.

H. MEREDITH, builder, Hambledon. Adj. April 7th.

F. BESZANT, builder, Chippenham. Deficiency £90.

S. HOLBROOK, plumber, Ilkeston. P.E., Derby C.C., May 15th, at 11.

W. WAKELING, master bricklayer, Brentwood. R.O. April 7th.

J. CHARLESWORTH, builder, Wolstanton. Deficiency £803.

R. H. DEWHIRST, girder and roof maker, Bradford. Deficiency £434.

J. BLAND, builder and contractor, Battlebarrow. Deficiency £39.

E. DENNY, builder and contractor, Grange. Deficiency £150.

C. A. WATSON, builder and contractor, Spalding. Deficiency £952.

W. DUNCAN, builder, Chorlton-upon-Medlock. Liabilities £3,500; assets £87.

A. W. JAGGERS & Co., builders and contractors, Crofton Park. P.E., Greenwich C.C., May 8th, at 11.

J. ATHERTON, plumber, Great Yarmouth. R.O. April 10th.

J. BARRY & SON, builders and contractors, Scarborough. Adj. April 12th.

T. DAVID, house decorator, Mountain Ash. First meeting, 135, High Street, Merthyr Tydfil, April 26th, at 12. P.E., Temperance Hall, Aberdare, May 14th, at 10.30.

F. PHIPPS, builder, Oxford. First meeting, 1, St. Aldate's, Oxford, April 25th, at 3.30. P.E., County Hall, Oxford, April 25th, at 11.30.

J. ROWDEN, builder, Hammersmith. First meeting London Bankruptcy Court, April 26th, at 11. P.E., same, May 22nd, at 11.30.

M. BRITCHFIELD, builder, Skegby. First meeting, O.R.'s, Nottingham, April 27th, at 11.15. P.E., Nottingham C.C., May 4th, at 10.30.

Partnerships.

Dissolutions of Partnerships.

[The date when the partnership was dissolved is given in parenthesis where known.]

R. BENSON & R. DEWS, contractors, Bately. (April 2.)

J. SCHOFIELD & J. HOLT, joiners and builders, Rochdale. (April 5.) Debts by J. Holt.

E. JEWELL & E. T. DAVIES, builders and contractors, Glam. (April 3.) Debts by E. T. Davies.

G. Z. & W. C. STEVENS, builders and contractors, Holloway, N. (Feb. 24.) Debts by W. C. Stevens.

W. W. & H. R. WADE, builders and contractors, Aylsham. (April 6.) Debts by either partner.

G. HIND & A. E. DOUGHTY, plumbers, gasfitters and contractors, Liverpool. (Mar. 5.) Debts by G. Hind & A. E. Doughty.

A. W. LYNE & J. E. SMITH, builders and contractors, Clapham, S.W. (Mar. 31.) Debts by A. W. Lyne.

J. KNIGHT (deceased) & P. L. HAINE, timber, slate, lime, cement and builders' merchants. (Jan. 1.) Debts by P. L. Haine.

J. RADCLIFFE & SONS, builders and contractors, Huddersfield. (Mar. 9.) Debts by L. & A. Radcliffe, who continue.

G. WELLS & A. B. BROWN, builders, Newcastle-upon-Tyne. (April 2.) Debts by G. Wells, 74, Hazlewood Avenue, Jesmond, Newcastle.

J. R. WATERMAN, M. BOFF, T. WATERMAN & A. K. WATERMAN, builders and contractors, Watford. (Mar. 25.) Debts by M. Boff and T. & A. K. Waterman, who continue.

W. & G. TYSON, builders, Nottingham. (Mar. 24.) Debts by W. Tyson, who continues in his own name. G. Tyson will carry on business in his own name at 8, Wilford Road.

C. & A. HANN, builders, contractors and lime merchants, Beaminster. (Mar. 31.) C. Hann continues at Prout Bridge, Beaminster, as C. & C. Hann; A. Hann will carry on business at Fleet Street, Beaminster, as Albert Hann & Sons.

PICCADILLY HOTEL: DETAIL OF CAST-IRON STANCHION AND CONNECTIONS.

The Month's Trade.

(Reports by our Special Correspondents.)

THE STONE, GRANITE AND MARBLE TRADES.

There is again very little change to be reported in these trades. The labour returns of the Board of Trade show that employment was generally fair in limestone quarries, dull in slate and granite quarries, and quiet in other quarries.

Employment in limestone quarries was fair in Derbyshire, Weardale and North Wales, and good in the Cleveland district and Cumberland. In the Bath stone quarries it was better than a month ago, when it was reported as slack. A slight improvement occurred in the Plymouth district, where, however, employment remained quiet.

As regards other stone, employment was good in chert quarries in Derbyshire, where overtime continued to be worked. It was slack in the Gloucestershire pennant stone quarries. In grindstone and building stone quarries in the Rowsley district employment was fair, and better than a month ago, and it was fair in sandstone quarries in North Wales. At Gateshead employment was somewhat irregular on account of bad weather. It continued moderate in the Cleve Hill road-material quarries and bad in Forfarshire, with much short time.

Employment in the granite quarries continued dull in Aberdeenshire. In Devonshire and Cornwall it continued bad, but it was a little better than a month ago in certain quarries. It was fairly good in Leicestershire.

With the sett-making industry employment was good at Edinburgh, and fair in North Wales and in Aberdeenshire. It continued moderate in the Cleve Hill district.

The returns for imports of stones, slabs and marble, rough, hewn and manufactured, for the month of March, 1906, as compared with the same month in 1904 and 1905, are as follows:—

Tons.			Value.		
1904.	1905.	1906.	1904.	1905.	1906.
104,026	105,849	93,289	£118,278	125,932	112,608.

THE SLATE AND TILE TRADES.

We are unable to report any change for the better in these trades, prices still remaining unremunerative and competition worse than ever. It was hoped a month or two ago that prices had reached the lowest possible level; this, however, does not appear to be the case, many orders having been taken recently at figures which experience shows to be below cost price.

This unfortunate state of things is entirely due to the fact that there is not sufficient work to keep the various contracting firms going, and there is little hope of any improvement until business increases. So far as can be ascertained from the various slate quarries, stocks are not excessive, nor do we think the merchants are buying heavily; consequently there is every probability of a sudden rise in prices directly the demand increases.

There is still considerable difficulty in obtaining certain specified sizes and qualities (more particularly in the three larger), viz., 24 x 12, 22 x 12 and 22 x 11, from some of the larger quarries, especially on the North Wales coast.

Westmorland Slates.

During the past month the railway companies have made a considerable reduction in the rates from these districts to London. Though the arrangement is only temporary it is hoped that the railway companies may feel justified in making it permanent. This should assist many of the quarries in this district, especially as regards the stouter slates, as hitherto the cost of transit has brought the cost of these qualities up to the same

level as the best. We understand that generally the trade in these slates shows no improvement, though one or two quarries appear to have been despatching material more freely. We have been unable to ascertain that any contracts of special interest have been settled during the past month.

Delabole Slate.

The Old Delabole Slate Company have recently introduced a slate procured from the deep bed of their quarry, which will be known as "Best quality specially stout slate." This slate has been specified for use on the Victoria and Albert Museum, and will be found to be of excellent quality. It is about double the thickness of the ordinary best slate from this quarry, and the cost will be about equal to the best quality regular size green slates. In country districts this slate weathers down to a pleasing silver-grey colour and the durability of the material is undoubted.

Sussex and Purbeck Stone Slates.

The demand for Sussex and Purbeck stone slating appears to have fallen off somewhat of late. This is doubtless owing to the difficulty of obtaining supplies, most of the quarries in the Horsham District having ceased working, except for purely local requirements; but we understand there is a possibility of a revival of this industry, as some fresh beds have recently been located. This material, like Colleyweston, is practically indestructible, and most of the old slates seen in Horsham have probably done previous service on two or three buildings. The cost of slating with this material (except in the immediate locality) is excessive owing to the heavy expenses for transit, many of these slates being zins. in thickness. One of the best examples of this kind of slate may be seen on the parish church at Horsham.

Precelly Slates.

There appears to be an increasing demand for these slates. They are more frequently specified and appear to meet certain requirements, coming as they do between the colour of Westmorland and Colleyweston. They present a picturesque appearance, being specially suited to buildings of a quaint design. The demand is particularly brisk for the quality known as rustics; to meet the requirements the quarry is being vigorously worked, and is, we understand, in better condition to supply demands than it has been at any previous period.

Broseley Tiles.

From the Broseley district we understand that the state of trade is much the same as last month, each works apparently securing a fair-sized order from time to time. Enquiries however are more frequent, and hopes are entertained of a revival in the near future. Enquiries have been frequent from Scotland and the North of England, Scotland especially being a new field for supply. Doubtless the demand for tiles in Scotland will increase, the rates being comparatively reasonable, and the brighter-coloured roof-covering will no doubt be welcome in many cases.

Sussex Tiles.

From the Sussex tile district we understand the first quarter of the year generally does not show a large output, but during March the demand for tiles of the hand-made sand faced type was nearly treble that of the corresponding period in 1905, giving hope that the ensuing months will show an equal improvement. The call for sand-faced tiles from this district has been met from accumulated stocks, the new infirmary at Shoreham having required about 300,000 tiles of this type from the works of the Keymer Brick and Tile Co. The outlook in this district is somewhat brighter than in other parts of the

country; several schools are about to be erected (at Portslade, Hellingly, Plumpton Bexhill, &c.), where local tiles will probably be used. It may not be generally known that some of the tile-works in the Sussex district also produce machine-made pressed nibbed-tiles. The demand for this type hitherto has been purely local and confined principally to speculative work.

THE CLAYWORKING INDUSTRY.

The extra demand for bricks which comes with the increased activity of the building trades in the Spring continues to effect a slight improvement in the brick trade, but the state of things must still remain bad as compared with former years. The Board of Trade returns for March state that employment during the month was on the whole slack. The slight improvement chronicled in our "Contractors' Supplement" for March continued, and there was also some improvement at Oldham, in the Market Harborough district, in South Wales, in South Staffordshire and at Birmingham. Employment continued good at Exeter and fair in the Tees and Hartlepool district.

THE PORTLAND CEMENT TRADE.

The forecast made in our previous "Contractors' Supplement" that prices for Portland cement would harden has been fulfilled, as manufacturers are now asking 1s. to 1s. 6d. per ton more than they were willing to accept earlier in the year. There is also less keenness on behalf of the manufacturers to book contracts ahead, even at the advanced price, as there is a general feeling prevailing that prices will rise considerably before the year is out, and thus compensate manufacturers for the enhanced prices they have to pay for their materials. In addition to the fact that the commerce of the world is active, there at last appears a little more movement in the home building trade, and architects are saying that plans and schemes formulated some years ago which have been waiting for more propitious times are being taken out of their pigeon-holes and having the dust removed ready for early development. It is the export trade, however, which is giving the greatest fillip to the cement market, and, with the sole exception perhaps of South Africa, the foreign and colonial outlets of the Thames and Medway manufacturers are calling for unusually large supplies. The imports for March again show a falling-off compared with the corresponding month of last year. This is due to two causes: firstly, the domestic consumer is beginning to find out that the proverb "penny wise pound foolish" is especially true when applied to cement, and that the alleged cheapness of a good deal of the Belgian article is more than counterbalanced by the smaller aggregate that can be safely used; and secondly, that the trade conditions in Belgium are such that there is less available for export. These various features give quite a buoyant tone to a market which has been drooping for so many years, and it is with relief that manufacturers are able to turn from a somewhat gloomy past to a more hopeful future.

News Items.

In answer to a question asked in the House of Commons recently, the Secretary to the Admiralty (Mr. E. Robertson) informed Colonel Lockwood that the Admiralty contracts stipulated that the Portland cement used should be what was technically known as artificial Portland cement.

The "Echo Industrielle" reports that the Belgian artificial Portland cement industry is suffering from a fraud said to be practised on a large scale. This consists in mixing natural cements with the artificial Portland

cement in order that the product may be sold as Portland cement, and at a much lower price than the genuine article. When put into use this adulterated product proves most unsatisfactory, and seriously damages the reputation of the genuine artificial Portland cement. In order to prevent being victimized by the fraud, buyers are warned by the cement industry of Belgium to see that the goods they purchase bear the marks of the reputed Portland cement factories.

Exports of Belgian cement in 1905 reached 688,825 tons, as against 588,295 tons in 1904, an increase of more than 100,000 tons, while importations into Belgium decreased by over 4,000 tons during 1905. In 1905 Great Britain received 206,584 tons of Belgian cement, against 231,213 tons in 1904.

The Yorkshire White Lime Co., Ltd., an Orange River Colony concern with property at Fountainspruit, in the Kroonstad neighbourhood, is about to engage in the manufacture of Portland cement. Mr. G. Reimers (a London expert) has reported favourably upon the clay found on the company's property, and limestone of the necessary purity is in close proximity. The new works are six miles from the nearest railway siding, and the Central South Africa Railway will provide transport by traction engines.

As showing how foreign cement manufacturers compete with those of the United Kingdom for the supply of British South Africa, the quarterly return issued by the South African Customs Bureau states that £59,000 worth of cement came from Great Britain as against £44,000 worth from foreign countries, chiefly Germany and Belgium.

The new Customs Tariff for Ecuador which came into force on January 1st last allows cement for building purposes to enter free.

The Australian Commonwealth Customs have decided that cement-stone machines, similar to presses for moulding hollow concrete building blocks, shall be admitted free, as machine tools.

The returns for imports and exports of cement for building and engineering purposes for the month of March as compared with the same month in 1904 and 1905 are as follows:—

		IMPORTS.		
		1904.	1905.	1906.
Tons	-	21,161	25,161	13,333
Value	-	£30,329	31,713	17,157
		EXPORTS.		
		1904.	1905.	1906.
Tons	-	22,841	35,857	12,888
Value	-	£37,776	59,502	79,930

Of the exports for March this year the Argentine Republic took 4,780 tons, British South Africa 9,637 tons, the British East Indies 11,278 tons, Canada 3,068 tons, New Zealand 2,477 tons, and Australia 1,010.

THE TIMBER TRADE.

The Board of Trade reports that employment in March with mill-sawyers and wood-cutting machinists on the whole was quiet, but was better than a month ago and a year ago. Trade unions with a membership of 4,813 reported 215 (or 4·5 per cent.) as unemployed at the end of March, compared with 50 per cent. at the end of February and 57 per cent. at the end of March, 1905. Employment was fair at Hartlepool, Sunderland, Huddersfield, Burnley, Liverpool, Warrington, Birkenhead, Birmingham, Norwich, Reading and Limerick; improving at Newcastle-on-Tyne, Jarrow, Nottingham, Northampton and Leek; and bad at Barrow, Rochdale, Stockport, Leeds, Hull, Grimsby, Loughborough, Wolverhampton and Dublin.

In accordance with the provisions of the Customs Regulation No. 131, a drawback will be allowed on the imported rough timber used in the manufacture of doors and sashes within the Australian Commonwealth upon exportation of such manufactured articles.

The Liverpool Market.

Operations in the Liverpool timber trade were somewhat interfered with by Easter, there having been a certain slowing-down of business before the holidays and a natural tardiness in resuming afterwards. Apart from this disturbance, however, business has been good. Prices generally are firm, and the conditions as regards supply and demand suggest higher rather than lower ranges.

Deals.

In builders' timber, the arrivals of spruce and pine deals from New Brunswick and Nova Scotia have been on a moderate scale, and the timber has been taken up freely for use inland. Values have lately ranged from £7 12s. 6d. to £8 5s. per standard, according to quality, but there has been a slight hardening, and recent business has been done at or near £8, with forward delivery business at £8 to £8 5s. The recent consumption has been slightly in excess of the consumption at the corresponding date of last year, but over the period from the beginning of January to the present date the consumption has been less than for the corresponding period in 1904 and 1905. The stock in hand is about one-fifth greater than at the corresponding date of last year, and represents about two-and-a-half months' consumption on the basis of recent deliveries.

Quebec pine deals have come to hand in small quantities. The demand has been very fair, while the stock is only about two-thirds of that held at the same date last year. The stock of Quebec spruce deals is nearly double the quantity held last year, but the stock then in hand was very small. The deliveries of this timber have been on a moderate scale, so that the stock in hand is ample for requirements. Values of Quebec pine deals have ranged from £22 10s. to £32 10s. per standard for first-quality wood, from £17 to £22 for second quality, and from £11 10s. to £13 for third quality. Spruce boards have ranged from £6 15s. to £7 5s. Canadian square wood has been quiet, both as regards arrivals and deliveries. Stocks are comparatively small, being less than half, in the aggregate of cub. ft., than the quantity held a year ago. With the recent small consumption the quantity seems ample for likely demands. The price has ranged for 1s. 8d. to 3s. 3d. per cub. ft., and red pine from 1s. 8d. to 2s. 3d. per cub. ft.

Pitch-pine

continues in a very strong position. Sawm wood and planks have come to hand in fair quantities, though not nearly so plentifully as at the corresponding time of last year. The stock of hewn timber is now very small; equalling less than a month's consumption, on the recent basis. The price has ranged from 1s. 3d. to 2s. per cub. ft., and holders are firm in their demands. The stock of sawn is still smaller, comparatively, being less than one-ninth of the quantity held a year ago, less than one-tenth of that held in 1904, and less than one-half the quantity consumed in a recent normal month. The price ranges from 1s. 4d. to 1s. 8d. per cub. ft. The stock of planks is also light, and less than the quantity of a recent normal month's consumption. The price ranges from 10d. to 1s. per cub. ft. Prime deals and boards range from £16 to £17 10s. per standard. There has been a freer importation of these last-named woods, and fair stocks are held. Business in pitch-

pine generally has, however, been restricted by the high range of prices, buyers taking up as little stock as possible in the hope of obtaining easier terms later.

Oak.

Oak in logs has been received in fair quantities from the United States. With an improved enquiry deliveries have been on a larger scale, and stocks are much below the quantities held in 1905 and 1904. Prices have consequently advanced, 1s. 6d. to 2s. 6d. per cub. ft. being the present range. The recent arrivals of planks have been on a moderate scale, but, for the present year, to date, the quantity received has been considerably in excess of the quantity received in the corresponding period last year, though less than in 1904. The deliveries have been in excess of those of a few weeks ago, and stocks have been greatly reduced. Values range from 1s. 6d. to 2s. 2d. per cub. ft., and are very firm thereat. Baltic oak has been entirely neglected of late. The stock in hand is small, but more than suffices for requirements on the basis of deliveries during the present year, to date.

Teak

has been imported freely and the stock is much in excess of that held at the corresponding date last year and in 1904. The demand has been small, so that prices are easy. Planks are quoted at £16 to £17 10s. per load, and East Indian wood at £13 to £20 per calliper load. Greenheart has been imported in fair quantity. The demand has been limited, and there is now a large stock of this wood in hand. From £7 to £7 5s. per load is the present range of values.

Mahogany.

Mahogany, chiefly African sorts, has been imported in considerable quantities. The stocks of Cuba, Tobasco, African and Colombian in brokers' hands, made, with the newly imported wood, scope for three days' good business in the auction room.

THE GLASS TRADE.

The glass trade continues fair. The Board of Trade returns for March show that with sheet-glass makers and flatteners at St. Helens employment in the month continued good. It was slack with pressed-glass makers in the Tyne and Wear district, though slightly better than last month. With plate-glass bevellers and silverers at Birmingham it was fair. Employment with glass blowers in London continued good.

By the new commercial treaty between Belgium and Austria-Hungary, concluded on February 12th last, the tariff schedule of the latter has been reduced for certain Belgium goods, and in virtue of the Austro-British treaty of 1876 these reductions are applicable to goods from the United Kingdom. The new rates for mirror, sheet and plate, and rough-cast glass, rough, not smoothed, polished, figured, foliated or coloured, not more than 5mm. thick, are 10 kronen per 100 kilograms (gross weight) for sheets the perimeter of which is 240 cm. or less, 11 kronen for over 240 and up to 400 cm., and 13 kronen for over 400 cm. If the rough glass is coloured it is charged a uniform rate of 24 kronen per 100 kilograms. If smooth, polished, figured, curved, even coloured or flashed, it is charged 28 kronen when not cut in facets and not foliated, 29 kronen when cut in facets but not foliated, or if cathedral glass (white or not), and 30 kronen if foliated.

The returns for imports and exports of glass for the first three months of 1906, as compared with the same period of 1904 and 1905, are as follows:—

		IMPORTS.			EXPORTS.		
		1904.	1905.	1906.	1904.	1905.	1906.
Window and German sheet, including shades and cylinders		342,094	236,665	374,334	185,648	141,665	211,868
Plate		117,378	122,237	100,614	141,609	149,519	130,832
Plate		-	-	-	18,636	27,628	32,912
					25,450	39,697	50,2

A trust has been formed of the manufacturers of plain glass in Spain. It is composed of nine companies, situated as follows:—Two in Bilbao, of which one will be closed; two in Gijon, of which one will be closed; one in San Sebastian; two in Reinosa, of which one will be closed; one in Mataporquera, which will be closed; and one in Seville, which will be closed as regards plain glass. The Seville factory will continue to manufacture undulated (*ondulado*) glass for roofing and stamper (*timbrado*) glass.

A new method of making window glass has been devised by Mr. Fourcault, a Belgian, who has sold his patent to the European syndicate of plate-glass manufacturers for £190,400. This syndicate consists of German, French and Belgian manufacturers, and one Bohemian factory. Hitherto, for windows, the molten glass has been blown into cylinders by glass-makers' pipes, and subsequently flattened, while in the making of plate glass the viscid mass was cast from the pots and rolled. The new invention draws the molten substance from the pot and conducts it between rollers lying side by side. Seventeen pairs of these rollers are built up towerlike above the pot. The liquid mass cools on its way between the rows of rollers and comes out from them polished on both sides, in any desired thickness (this being regulated by the relative position of the rollers), flattened and ready for use.

THE PAINT TRADES.

The paint trades are fair. As regards materials, the returns for imports and exports for March, 1906, as compared with the same month in 1904 and 1905, are as follows:—

	IMPORTS.			EXPORTS.		
	1904.	1905.	1906.	1904.	1905.	1906.
White lead	-	33,331	27,850	25,752	29,938	36,502
Zinc oxide	-	-	18,545	-	4,883	6,572
Other colours and pigments	-	131,965	131,745	119,056	119,904	119,671
Turpentine	-	13,715	9,395	-	-	-

			7,785			54,350
			2,652			44,665
			41,289			

THE IRONMONGERY TRADE.

The builders' ironmongery trade still remains under a cloud. Goods used by the engineering trades continue in good demand. The Board of Trade returns for March show that employment in the lock and latch trade at Wolverhampton continued bad, much short time still being worked. It had improved on cast-iron hollow-ware, but had declined with makers of iron hurdles and fences. In the hollow-ware trade it continued good at Wigan, fair at Birmingham and West Bromwich, and slack at Sheffield.

Employment in the stoves, grates, &c. trades continued fair at Falkirk, but was very quiet at Rotherham. At Glasgow it had improved slightly, but was still quiet; at Bolton it was fairly good.

With nut and bolt makers employment was good at Darlaston and Winlaton, and fair at Birmingham and in South Wales. With wire nail and cut nail makers at Birmingham it continued fair. At Black Heath with nail workers it was fair, but with rivet makers it was quiet.

Employment in the wire trade continued generally good and rather better than a month ago.

The returns for imports and exports for March 1906, as compared with the same month in 1904 and 1905, are as follows:—

	IMPORTS.			EXPORTS.		
	1904.	1905.	1906.	1904.	1905.	1906.
Wire nails	-	2,564	3,522	-	1,673	2,172
Nails (other than wire nails), screws and rivets	-	1,267	1,308	-	1,160	1,781

						38,291

THE IRON AND STEEL TRADES.

Whilst volcanoes have been displaying their unsuspected energy to an astonished world, and bishops and schoolmasters have been hurling upon us streams of oratorical lava, the steel market has done nothing to distinguish itself save maintain a state of dignified and philosophic calm. It is not, however, to be expected that its movements should embrace the whole gamut of human possibilities in the course of every month.

Circumstances of supply and demand must in all seasons prevent anything of the nature of a prolonged monotone, but even that, uninteresting though it may be, is preferable in the interests which this journal represents to a Wagnerian medley of inspired bulls and bears, so dear to the speculative mind.

Again, to gather a fair conception of the trade of the present and, what is more to the point, the possibilities of the near future, breadth of perspective should be aimed at, not a minute inspection of the most immediate conditions. Such a view, like a sunrise by Whistler, is instructive by reason of its broad effects, and much more nebulous of prophesy than the more confining pre-Raphaelitic production. Those little lulls and spurts which we see to-day are inevitable to all times and seasons—whether of prosperity or drought—are not to be regarded too seriously.

IRON AND STEEL EXPORTS FROM THE UNITED KINGDOM (TONS).

	1905.	1906.
Wrought-iron, &c.	31,285	32,652
Steel bars, &c.	30,860	43,666
Steel girders, &c.	15,173	27,296
Galvanized sheets	101,801	116,234
Black plates	13,484	15,012
Miscellaneous	164,845	221,923

The total increase in iron and steel exports for the three months, over the corresponding period of 1905, is 185,000 tons, representing a value of £1,895,000.

Turning from the contemplation of these figures to more immediate circumstances, the past few weeks show a record of very even tenour, but not by any means an unsatisfactory one.

From Scotland we hear of a noticeable falling-off in the income of orders with the inevitable accompaniment of a slackening of prices all round, and sellers seem to be acting with considerable reserve. Pig-iron descriptions show a shading of 6d. and 1s. all round, warrants being now quoted at about 55s. per ton. This has not, however, had any marked effect on prices of manufactured shapes. Steel angles are still quoted at £7 per ton, steel bars at £8 and sheets at £8 7s. 6d. As a matter of fact, makers have still a fair amount of orders on hand, and it is confidently expected that these prices will be maintained in spite of any appearance of weakness in the market. What the ultimate effect will be of the competition which our Scottish friends are experiencing from makers immediately over the border—i.e., in the north-east of England—remains to be seen.

A step further south, in Middlesbrough to wit, something of mild optimism is discernable. This is not inspired by any great briskness of demand, but rather for the negative reason that makers have not entirely worked through their orders. In manufactured steel generally there is no appreciable falling-off in prices in this district, which now stand somewhere in the region of the following figures:—

	£	s.	d.
Steel sheets	8	0	0 per ton.
" angles	6	10	0 "
" joists	6	7	6 "
" bars	7	0	0 "
Iron bars	7	5	0 "
Best iron bars	7	15	0 "
Iron angles	7	5	0 "

Turning to the industrial Mecca of the Midlands, we find that no great degree of originality has characterized the Birmingham market to distinguish it from other centres. If anything, however, the trade is just a trifle more confident in its anticipations than elsewhere. Ordinary merchant bar-iron, which as a rule strikes the keynote for all the lines in which we are particularly concerned, still maintains the figure of £7, rising to £7 5s., and sales which have been reported at £6 17s. 6d. have only been for inferior sorts. At any rate, the official figure of £7 5s. is not far wide of what is actually being obtained, and this remark applies to marked iron bars, for which the official quotation is £9.

Other lines in the Midlands remain pretty firm at the figures which prevailed two or three weeks ago. Steel angles are still quoted at £6 10s. to £6 12s. 6d., joists at £7 to £7 2s. 6d. and girder-plates at £7 10s. to £7 12s. 6d. Steel for structural work generally is in very fair demand, and a steady tone seems to prevail throughout.

On the Continent the complexion of affairs is somewhat different to what we have been experiencing on this side. Many people who have been looking for a slackening of trade in Belgium and Germany, and a more competitive attitude towards the markets of this country, have been considerably disappointed.

Trade all over, more particularly in rolled steel sections for building purposes, appears to be exceptionally brisk at all Continental centres. In fact many of the works are getting behindhand in the despatch of orders,

and all have quite sufficient to keep them actively employed for some time. Needless to say, there has been a marked change in quotations for Continental rolled steel in this country. Rolled steel joists and channels have slowly and steadily advanced since the end of March, and are still inclined to go up. Prices for joists delivered c.i.f. Thames or equal ports now range from £5 15s. per ton and upwards to £5 17s. 6d. per ton, according to specification, and channels 4s. to 6s. higher in ordinary sections. Steel angles range from £6 1s. to £6 2s. 6d. and steel tees from £6 2s. 6d. to £6 5s., delivered c.i.f. Thames. To buyers in this country who are favourably situated in the manufacturing localities—that is to say, within an easy freight radius of works—the Continental prices do not present any great attraction. In fact, among the generality of consumers on this side there is not likely to be any very spirited demand in the near future.

Other Metals.

Some buyers have lately been looking forward to an easing off in the prices of corrugated sheets, as one of those things which have only to be waited for to be achieved. The associated makers, however, do not display any great degree of alacrity in coming into line with this view, and are still holding out for their figure of £12 7s. 6d. for 24-gauge f.o.b. In fact, it is difficult to see by what reason any material shading of this figure can be expected, as the trade on the whole displays a good normal state of activity.

In lead, although the trade shows signs of increasing activity, the quotations are still somewhat behind the figures they touched some weeks back. Present prices, however, show a fair tendency to advance on the more recent quotations, soft foreign being quoted at £15 17s. 6d. and English at £16 5s.

In tin there has been a steady and consistent advance in prices, and the present figure of £176 per ton shows a very satisfactory condition in this market. In the United States there has been a remarkably heavy consumption latterly, and this has had its inevitable effect on London prices. The value imported into the United Kingdom from all sources shows an increase of £28,000 for the first quarter of the present year.

Copper also has shown considerable strength recently, although this is a line which at the best of times is sensitive to a variety of circumstances. The present figure is £84 15s. to £85 for standard copper, which compares with £82 a month ago.

No large amount of business has been done in spelter latterly, many buyers being inclined to hold back and wait events. Nevertheless the figure of £25 15s. per ton for good ordinary brands is well maintained, and conditions do not point to any material reduction of this price in the near future.

The tinplate trade is regarded with some concern, the recently advanced tariffs on material going to Germany, and considerable anxiety prevails in Wales as to future prospects. The increase in the duty is from 2s. 6½d. to 2s. 9½d. per cwt., which of course has been inspired by the leaders of the tinplate industry in Germany. Added to this, the Canadian Government are being urged to place an import duty on tinplate for the benefit of manufacturers in the Dominion, who say they are fully equal to meeting all local demands. So far as export prospects are concerned, the outlook for the Welsh industry certainly leaves something to be desired.

News Items.

Sheffield reports a large increase of activity in the file trade.

Blast furnacemen in the Cleveland district have been awarded an advance in wages of 3½ per cent.

The production of steel in the United States last year was 19,912,000 tons, representing an increase of 6,000,000 tons over the figures for 1904.

The increase in Germany's small steel trade is evidenced by the fact that last year she exported 10,400 tons of cutlery as compared with 7,559 tons in 1903.

The New South Wales Government propose to purchase £100,000 worth of wire netting to sell to the farmers, to assist the latter in dealing with the rabbit pest.

The spring meeting of the Iron and Steel Institute takes place on May 10th and 11th. Ten papers on various subjects appertaining to the industry are to be read, and six reports will be presented on work carried out by Carnegie scholarship holders.

An important discovery of iron ore deposits is reported from Ailerbach, in Saxony. The deposits are nearly two miles long, 167ft. in width and 70ft. deep, and represent by far the most extensive discovery of the kind yet recorded in Germany.

THE LIVERPOOL DISTRICT.

The report of the Liverpool Building Surveyor, Mr. W. Goldstraw, on the work done in his department during the year 1905, shows that last year 2,186 new dwelling-houses, 42 public buildings, 3 warehouses and 117 new stables and minor buildings were erected in the city of Liverpool, and that 181 extensive additions and alterations to property, and 577 small additions and alterations, were carried out. The report gives the following information, which is of interest and value as indicating work likely to be done as regards the erection of new dwelling-houses in the course of the present year. The growth of the city as a whole has continued at a steady rate, which has averaged 1,960 houses in each of the last ten years, and 2,167 in each of the last five years. Last year the number of new houses erected was 251 above the average of the previous nine years. Assuming, therefore, that the average of the last five years be maintained during the present year in Liverpool an addition of upwards of 2,100 dwelling-houses will be made to the number of houses existing on January 1st last. Some idea of the character of the demands likely to be made for building materials for the new dwelling-houses erected during the present year may be obtained by a survey of the character of the houses erected during each of the last three years. The rent-value of the houses erected was as follows:—

	1903.	1904.	1905.
Under £12	201	258	78
£12 to £18	363	284	394
£18 " £25	1,058	1,067	872
£25 " £35	706	449	638
£35 and upwards	125	116	204

News Items.

The Levenshulme Urban District Council purpose carrying out a scheme of street improvements at an estimated cost of about £13,439. At the Local Government Board enquiry there was no opposition.

It is probable that the work of erecting the new Council offices and library at Northwich will be proceeded with shortly. The Council recently made an offer to Messrs. Greenall, Whitley & Co. for certain property adjoining their present offices, in order to obtain a site for new offices, and negotiations are proceeding satisfactorily.

The Runcorn Rural District Council have obtained the sanction of the Local Government Board to its borrowing £1,620 for new sewerage works in the district of Walton Inferior, Cheshire.

The Birkenhead Town Council have decided that their new central library shall be erected on a plot of land owned by the corporation, in Market Street South. Towards the cost of the building the council will have a gift of £15,000 from Mr. Andrew Carnegie. The council have also decided to enlarge the

plant at the Bentinck Street electricity station at a cost of £11,896. The work to be done will include the provision of two boilers, a new engine and new condensing plant and the necessary adaptations. The education sub-committee for the neighbouring Bebington and Neston district area, Cheshire, have decided to erect a new secondary school.

The Lancashire Education Committee are now proceeding with an extensive scheme of school buildings which will require about three years to complete.

At Widnes, the want of a new hospital is being felt increasingly. The question of providing one came before the town council at their last meeting, but no decision respecting the matter was then arrived at. The matter, however, is likely to come up for consideration again shortly.

For warehouse floor-work, concrete has come into large use in the Liverpool and Manchester districts. The floors of the new dock warehouses and sheds of the Mersey Docks and Harbour Board are of this material. Some of the warehousing companies of the district have also employed it for their work.

THE WALLPAPER TRADE.

The wallpaper trade continues fair. Foreign competition is a little brisker though not serious, although imports are more than a year ago and slightly more than in February. Our exports, however, are only the merest shade better than a month ago, and less than a year ago and still further behind 1904, as the following return of paper-hangings for March will show. The results of the first three months' trading of the current year are, however, satisfactory, being very little behind last year and the year before. They are as follows:—

Complete List of Contracts Open.

With a few exceptions, news of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issue of other contracts that still remain open.

Unless expressly stated to the contrary all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair-wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

April 26. Taunton.—Rearranging the interior of Gray's Almshouse, East Street, Taunton. Plans and specification may be inspected at the office of J. Houghton Spencer, architect, 5, Hammet Street, Taunton, from 9.30 a.m. to 6 p.m., and sealed tenders, endorsed "Gray's Almshouse Tender for Works," to H. Plans, sections, stipulations and specification may be seen, and bill of quantities and form of tender obtained, at the office of the Surveyor, upon payment of the sum of £1 rs. Fair wages clause. Sealed tenders (upon the form supplied only) and priced quantities and schedule to be forwarded under separate covers, endorsed "Rectory-house Extension," and addressed to the Chairman of the Gas Committee, to be delivered to W. E. Beacham, C.E., surveyor to the Council, Town Hall, Leek, before noon on May 1.

May 1. London, N.E.—Enlarging and improving the Kingsland Secondary School, Colvestone Crescent, Dalston, N.E., for the London County Council. Persons desiring to submit tenders may inspect the drawings and specification and obtain the bills of quantities, form of tender and other particulars at the Education Offices (Architect's Department), Victoria Embankment, W.C., upon payment to the cashier of the sum of £3. Tenders must be upon the official forms, and the printed instructions contained therein must be strictly complied with. Fair wages clause. Each tender must be enclosed in an envelope (which will be provided) and delivered at the Education Offices (Room 148), Victoria Embankment, W.C., not later than 11 a.m. on May 1.

May 1. Southend-on-Sea.—Erection of a new school (825 places). Bills of quantities may be obtained and the plans inspected at the offices of the architects, Greenhalgh & Brockbank, Bank Chambers, Southend-on-Sea, on payment of a deposit of £2 2s. Tenders to be sent in to R. Langton, clerk, Education Committee, Southend, by May 1.

May 1. Maesycwmmr.—Erection of a shop in North Avenue, Maesycwmmr, for W. H. White, Cardiff. Plans and specification may be seen at the offices of W. Harris, architect, Gilfach, Bargoed, to whom tenders are to be sent by May 1.

May 1. Leyton.—Erection of car-sheds on the site in Lea Bridge Road, for the U.D.C. Plans may be seen and specification, bill of quantities, form of tender and other particulars obtained of William Dawson, M.I.C.E., Town Hall, Leyton, between 10 and 4 (Saturday 10 to 12), upon payment of £2 2s. Sealed tenders (in special endorsed envelopes supplied with the forms) must be delivered at the meeting of the Council, to be held at the Town Hall, Leyton, at 8 p.m. on May 1.

May 1. Lisgoole.—School. Tenders will be received by the Rev. C. Halahan, Rossory Rectory, Enniskillen, on or before May 1, for the erection of the

proposed Jones Memorial School, at Lisgoole, according to drawings and specification to be seen every weekday at the office of T. Elliott, architect, Darling Street, Enniskillen.

May 1. Aberystwyth.—New science and technical buildings at the Aberystwyth County School, the plans and specifications of which can be inspected at the office of T. E. Morgan, architect, Aberystwyth. Sealed tenders to be sent in so as to reach John Evans, clerk, 6, Portland Street, Aberystwyth, on or before May 1.

May 1. Bervie.—Mason, carpenter, slater, plaster, plumber and painter works of a proposed police-station at Bervie, for the County Council of Kincardineshire. The plans may be seen with the Police Constable at Bervie; or with the architect, George Gregory, Stonehaven. Schedules of quantities can be had from the architect. Offers to be lodged with A. W. Kinnear, county clerk, Stonehaven, on or before May 1.

May 1. Kendal.—Altering and improving the branch shop in Wildman Street, for the Co-operative Society. Plans and specifications can be seen and bills of quantities obtained by applying to John Sta'ker, M.S.A., architect, Kendal, to whom tenders are to be sent, under cover, by noon on May 1.

May 2. London, N.E.—Building an economizer and fan-room, and altering and extending boiler flues at the Workhouse, Sidney Road, Homerton, N.E. Specification, conditions of contract, form of tender, and order to view the site can be obtained at the office of F. K. Coles, clerk's office, Hackney Union, Homerton, N.E., where also the plans (as prepared by L. J. Todd, consulting engineer, of 25, Bock Road, Stoke Newington, N.), may be inspected. Sealed tenders, endorsed "Economizer and fan-room at Workhouse," must be delivered at the clerk's office not later than 2 p.m. on May 2.

May 2. Huddersfield.—Alterations at Whitehouse Farm, Dalton. Plans, specifications, and general conditions may be seen, and bills of quantities and forms of tender obtained, on application at the offices of the Borough Engineer and Surveyor. Sealed tenders, endorsed "Tender for Alterations to Whitehouse Farm," signed in the handwriting of the tenderer or his agent, and addressed "Town Clerk, Town Hall, Huddersfield," must reach him not later than 10 a.m. on May 2.

May 2. London, N.—Erection of a public library at the corner of High Road and Station Road, Wood Green, for the U.D.C. Builders desirous of tendering should forward their names and addresses to C. J. Gunyon, A.M.I.C.E., the architect, at the Town Hall, Wood Green, not later than 5 p.m. on April 18, accompanied by a deposit of £2 2s. Form of tender and bills of quantities will then be forwarded. Tenders, upon the form supplied only, to be delivered to W. P. Harding, clerk of the Council, Town Hall, Wood Green, N., not later than 5 p.m. on May 2.

May 2. Totnes.—Erection of a board-room and offices, for the Guardians. Plans and specifications can be seen and bills of quantities obtained on payment of £2 2s., at the office of the architect, W. F. Tolitt, 10, High Street, Totnes. Tenders to be sent to F. K. Windcart, clerk, 19, High Street, Totnes, by May 2.

May 3. Glasgow.—Works to be executed in the construction of a potato shed and warehouse on the site of the old City Poor-house to the east of Buchanan Street Goods Station, and of a portion of a bridge to carry Dobbie's Loan for the Caledonian Railway Co. Drawings may be seen at the office of the Company's Engineer, Buchanan Street Station, Glasgow, where copies of the specification and schedule may be obtained on payment of £2 2s. Sealed tenders, endorsed "Tender for Buchanan Street Station Potato Shed, Warehouse and Relative Works," to be lodged with J. Blackburn, secy., Caledonian Railway Co.'s Offices, 302, Buchanan Street, Glasgow, by May 3.

May 3. Sunderland.—Erection of caretaker's house in connection with Harrison Buildings, in Silver Street. Drawings and conditions of contract may be seen, and specification, schedule of quantities and form of tender obtained at the Borough Surveyor's Office, Town Hall. Sealed tenders, addressed "To the Chairman of the Health Committee," and endorsed "Tender for Caretaker's House, Harrison Buildings," must be delivered at the Town Clerk's Office, Town Hall, before noon on May 3.

May 3. Hastings.—Repairs to two cottage homes, 100, Ashburnham Road and 59, Vicarage Road. A copy of the specification of the work may be obtained on application at the Union Offices, 11, Wellington Square, Hastings. Tenders to be sent in to Arthur R. Inskip, clerk, 11, Wellington Square, Hastings, not later than noon on May 3.

May 4. Norwich.—Enlargement of Shelton and Hardwick School, for the Norfolk Education Committee. Builders desirous of tendering should send in their names to A. F. Scott, architect, Castle Meadow, Norwich, at whose offices plans and specification can be inspected and bills of quantities obtained. A deposit of £1 rs. will be required. Tenders must be delivered by noon on May 4, addressed to "The Secretary, Norfolk Education Committee, 57, London Street, Norwich," and endorsed "Tender for Shelton and Hardwick School."

May 4. West Somerton.—Enlargement of the School. Builders desirous of tendering should send in their names to the Secretary, Norfolk Education Committee, 57, London Street, Norwich, at which office plans

and specification can be inspected and bills of quantities obtained. Tenders must be delivered by 12 noon on May 4, addressed to "The Secretary," at the above address, and endorsed "Tender for West Somerton School."

May 5. Burwardsley.—*Alterations and additions to the school buildings.* Plans and specifications can be seen at the office of H. Beswick, county architect, Newgate Street, Chester, and quantities obtained, on deposit of £1. Tenders, endorsed "Tender for Works at Burwardsley," to be sent to H. Grant Bailey, clerk, Crypt Chambers, Chester, on or before May 5.

May 5. Chelmsford.—*Erection of a pair of villas in Park Avenue.* Plans, specification and form of contract can be seen at the office of F. Whitmore, architect, 73, Duke Street, Chelmsford, to whom tenders, endorsed "Tenders for Villas, Park Avenue," must be delivered by May 5.

May 5. Rotherham.—*New Wesleyan church.* Thorpe Hesley, Rotherham. Quantities can be obtained at the office of A. E. Lambert, architect, 22, Park Row, Nottingham, after Monday, April 23. Tenders to be delivered to the undersigned not later than 11 a.m. on Saturday, May 5. Plans can be seen at the Wesleyan Day Schools, Thorpe Hesley, any day except Saturday, between the hours of 9 a.m. and 4 p.m. The Trustees do not bind themselves to accept the lowest or any tender. A. E. Lambert, architect, 22, Park Row, Nottingham.

May 5. Beverley.—*For the following work for the Corporation:* (a) the construction of a concrete retaining wall on piled foundations at their wharf on the River Hull, at Grovehill, Beverley; (b) The supply and erection of wrought-iron fencing at Queensgate Cemetery, Beverley; (c) the carrying out of private street works in Prince's Gardens, Beverley. Drawings, conditions and specifications can be seen and copies of the bills of quantities with forms of tender obtained on application to J. Gould Smith, A.M.I.C.E., Guildhall, Beverley. Sealed tenders, accompanied by priced quantities, endorsed respectively (a) "Concrete Wall, Grovehill," (b) "Cemetery Fencing," and (c) "Prince's Gardens," to be sent to J. Willis Mills, town clerk, Beverley, not later than noon on May 5.

May 5. Rainham.—*Erection of a new Council school to accommodate 250 children at Rainham, Kent.* The drawings and specifications may be inspected at the office of the architect, G. E. Bond, High Street, Rochester. Any person desiring to tender must send in his name to the Architect, accompanied by a deposit of £1, not later than noon on April 20. Tenders, on the form supplied, to be delivered to Ernest C. Harris, 76, High Street, Sittingbourne, not later than noon on May 5.

May 7. Alderley Edge.—*Erection of a new lodge, boundary walls, fencing and other work on the new cemetery on the Chelford Road, for the U.D.C.* The plans may be seen and bills of quantities obtained from the surveyor to the Council, Harold Sheldon, Council Offices, Alderley Edge, by payment of a deposit of £1 is. Tenders, sealed and endorsed "Tender, New Cemetery, Alderley Edge," must be delivered at the Council Offices, Alderley Edge, before noon on May 7, addressed to Walter Cobbett, clerk to the Council.

May 7. Leeds.—*Workhouse extensions.* Contractors desirous of tendering for the bricklayers and masons, carpenter and joiners, plumbers, plasterers, slaters, painters, concreters, ironfounders, tilers, hot water heating and electric lighting required in the erection of three new blocks and a master's house at the Workhouse, Beckett Street, must send in their names to the architects, Thomas Winn & Sons, 84, Albion Street, Leeds, on or before May 7th, when bills of quantities will be forwarded. Each application must be accompanied by a deposit of £2 2s.

May 7. Sawbridgeworth.—*Erection of a cart-shed at the depot in Church Street, for the U.D.C.* Plan and specifications can be seen at the Council offices between the hours of 10 and 4. Tenders, endorsed "Tender for Cart-shed," to be sent to William Morris, clerk to the Council, Council Offices, 15, Bell Street, Sawbridgeworth, by 4 p.m. on May 7.

May 8. Cupar.—*Taking down and rebuilding a portion of existing arch of the Ladybura at the foot of Bishopgate, Burnside, Cupar.* Drawings may be seen and copy of the specification, schedule of quantities and form of tender obtained from Bruce, Proudfoot & Macrae, civil engineers, 67, Crossgate, Cupar. The tender to be delivered in a sealed cover, marked "Tender for Ladyburn Covering," and sent to J. L. Anderson, town clerk, Town Clerk's Office, Cupar, by 10 a.m. on April 30.

April 30. Darlington.—*Supply, delivery and erection of a counter current jet condensing plant complete with piping and cooling tower.* Plans, specification and form of tender may be obtained from the Borough Electrical Engineer, Electricity Works, Houghton Road, Darlington, on payment of a deposit of £1 is. Sealed tenders, endorsed "Condensing Plant," to be delivered at the office of H. G. Stevenson, town clerk, Houndgate, Darlington, on or before April 30.

May 1. Basingstoke.—*Construction of a circular concrete high-level service reservoir, holding about 22,000 gallons, and also for the erection of a wind engine and pump.* Plans may be seen and specification and quantities obtained at the office of F. Reginald Phipps, A.M.I.C.E., borough surveyor and waterworks engineer, Town Hall, Basingstoke, on payment of £1 is. for each contract. Tenders, on the prescribed form only, endorsed "Reservoir" or "Wind Engine," as the case may be, must be delivered by noon on May 1.

May 1. Gosport.—*Mainlaying, for the Gosport Waterworks Co.:*—Carting, handling, excavating for, laying and jointing about eight miles of 15in. and 16in. cast-iron pipes, castings, valves and other fittings and works. The drawings can be inspected and copies of the specification, conditions, quantities and tender forms obtained at the Company's Offices upon the payment of £5. Contractors must be prepared to enumerate works of a similar nature and magnitude previously carried out by them. Sealed tenders, endorsed "Mainlaying," and addressed to the Chairman of the Company, must be delivered at the office of E. T. Hildred, A.M.I.C.E., engineer and manager, Gosport Waterworks Co., 1, High Street, Gosport, not later than noon on May 1.

May 1. London, N.—*Hot-water heating apparatus for Pavilion No. 1 at the Northern (Convalescent) Fever Hospital, Winchmore Hill, N., for the Metropolitan Asylums Board, in accordance with drawings and specification prepared by W. T. Hatch, M.I.C.E., M.I.M.E., engineer-in-chief.* Drawings, specification, conditions of contract and form of tender may be inspected at the Office of the Board, Embankment, London, E.C., and obtained upon payment of a deposit of £1. Tenders, addressed as noted on the form, must be delivered at the Office of the Board not later than 10 a.m. on May 1.

May 2. Ipplepen.—*Supplying, delivering and laying about 4,000 yds. of 4in. and 3in. cast-iron water-mains, together with the requisite meters, sluice valves, air valves, washouts, hydrants and other fittings, the construction of a covered service reservoir, boundary walls, meter house and store, and other works, in the parish of Ipplepen, for the Newton Abbot R.D.C.* Drawings may be seen and copies of specifications, bills of quantities, and forms of tender obtained at the office of the engineer, F. W. Vanstone, Palace Chambers, Paignton, on payment of £5. Sealed tender, upon the form provided, endorsed "Ipplepen Waterworks," are to be delivered to Frederick Horner, clerk to the Council, Council Offices, Newton Abbot, not later than 10 a.m. on May 2.

May 2. London, E.C.—*Extension of Parkeston Quay and construction of a shed and sidings in connection therewith, for the Great Eastern Railway Co.* Persons desirous of tendering can, on application to the Engineer, obtain copies of the specifications and quantities, and the drawings can be inspected at his office at Liverpool Street on and after April 17 between 10 and 4. Sealed tenders, endorsed "Tender for Extension of Parkeston Quay," Contract No. 1, should be addressed to W. H. Pepper, corner, and must be delivered at the Secretary's Office, Liverpool Street Station, not later than 10 a.m. on May 2. Tenders to be sent through the "General Post Office." Any sent otherwise will not be considered. The sum of £10 ros. will be charged to each applicant for the specification and quantities, schedules and form of tender.

May 4. Stranraer.—*Construction of a concrete dam, the diversion of a farm road, the construction of a new filter and the rearrangement of existing filters and other works connected with the water supply of the Burgh.* Drawings may be seen and specifications, schedule, and form of tender may be obtained at the office of Gilbert Thomson, C.E., 164, Bath Street, Glasgow, on payment of deposit at £2 2s. Arrangements will be made to point out the site of the proposed works to intending offerors on the afternoon of April 27. Sealed offers, marked "Tender for Waterworks," to be lodged with W. Black, town clerk, Town Clerk's Office, Stranraer, not later than noon on May 4.

May 5. Guernsey.—*Quay wall, with low-level landing, on the southern side of St. Julian's Emplacement, Harbour of St. Peter-Port, Guernsey.* Drawings of the proposed works may be inspected, and the general conditions, specifications and forms of tender and other particulars obtained, upon application at the States Offices, Guernsey, on payment of £5. Tenders, enclosed in sealed envelopes, endorsed "Tender for Quay, St. Julian's," and addressed to John N. Brouard, supervisor of the harbour, &c., must be delivered so as to reach the States Office, Guernsey, on or before 3 p.m. on May 5.

May 7. Sydney (New South Wales).—*Plant.* For supply and erection of boilers, automatic stokers, pipe-work, &c.; turbo-alternator, sub-station machinery, switch-boards, &c., for the Municipal Council. Forms may be

obtained on application to T. Rooke, at the offices of Preece & Cardew, 8, Queen's Gate, Westminster, on deposit of £5 ss. Tenders to be sent in by May 7.

May 7. Sydney, N.S.W.—*Electric-lighting plant*—(a) Boilers, automatic stokers, pipe-work, &c., (b) turbo-alternator, sub-station machinery, switchboards, &c., for the Municipal Council. Specifications, plans and form of tender may be obtained on application to T. Rooke at the offices of Preece & Cardew, 8, Queen Anne's Gate, Westminster. A deposit of £5 ss. will be required on application, and a cash deposit or marked cheque for the sum of £1,000 will be required when the tender is sent in. Sealed tenders, endorsed "Tender for Electric Lighting Plant," are to be addressed to the Town Clerk, Town Hall, Sydney, and must be delivered by 4 p.m. on May 7.

May 8. Deptford.—*Construction of a footbridge* for the Borough Council, according to the drawings and specification which may be seen at the Borough Surveyor's Office at the Town Hall after April 23, during the ordinary office hours. It will be a condition of the contract that the steelwork must not be sublet. Fair wages clause. Bills of quantities prepared by W. T. Farthing & Son, together with the conditions of contract, may be obtained from the Town Clerk, Town Hall, Deptford, upon payment of a deposit of £1 ss. Persons desirous of tendering must send their names to the Town Clerk on or before April 17, to whom sealed tenders, in accordance with the Council's regulations printed on the form of tender, must be sent not later than 4 p.m. on May 8.

May 9. Brussels.—*For the construction of a metal bridge* at Beerlingen at an estimated cost of 44,907 francs (£1,676), for the "Société Nationale des Chemins de Fer Vicinaux." A deposit of 5,000 francs (about £200) is required to ratify any tender. Tenders should be addressed to the General Manager of the Company, at 24, Rue de la Science, Brussels, where specifications (price 1 franc) may be obtained.

May 11. Flamborough.—*For the construction of waterworks* at Flamborough, Yorkshire, including supplying and laying 2½ miles of 3-in. cast-iron pipes with all appurtenances, the construction of brick reservoir (capacity 50,000 gallons), and the erection of an engine-room. Plans can be seen at the offices of the engineers, Elliott & Brown, Burton Buildings, Parliament Street, Nottingham, from whom copies of the specification and bills of quantities and form of tender can be obtained on deposit of £2 ss. Sealed and endorsed tenders to be delivered to George Hankinson, clerk to the Bridlington R.D.C., Long Lane, Bridlington, on or before May 11.

May 12. Brussels.—*Railway plant.* For the construction of the section from S. Cécile to the French frontier, of the railway from Bértrix to the frontier via Mun. Estimated cost, 3,500,000 francs (£140,000); deposit, 100,000 francs (£7,500). Specifications ("cahier des charges," special No. 27) may be obtained at the Bourse, Brussels (price 4 francs 70 cents), where tenders will be received up to May 12.

May 16. Brussels.—*Railway plant.* For the construction of the Jodoigne to Esmael section of the local railway from Jodoigne to Tirlemont and St. Trond, and of buildings and roads in connection therewith. The estimated cost is 407,000 fr. (£16,040), and a deposit of 40,000 fr. (£1,600) is required. A copy of the specification may be obtained on payment of 1 fr. from M. Dartevel, rue de Turquie, No. 18, Saint Gilles, Brussels. Tenders, in sealed envelopes, should be addressed to the General Manager, Société Nationale des Chemins de Fer Vicinaux, 14, rue de la Science, Brussels.

May 23. Bristol.—*Electrically-driven hydraulic pressure pumps.* Erecting in the existing engine-house, Underfall Yard, testing and maintenance for twelve months after completion, of three sets of electrically-driven hydraulic pressure pumps. Each set is to be capable of delivering 150 gallons of water per minute against an accumulator pressure of 750 lbs. per sq. in. The contract includes the pumping machinery, and also the electro motors and accessories, and gearing for driving the pumps. On and after Thursday, April 12, copies of the specification, form of tender, form of contract and copies of contract drawings can be obtained from W. W. Squire, Engineer's Office, Cumberland Road, Bristol, on production of a receipt from the secretary of the Docks Committee showing that £5 has been paid as deposit. Tenders must be enclosed in a sealed envelope, endorsed "Tender for Electrically-driven Hydraulic Pressure Pumps," and addressed to the Secretary of the Docks Committee, 19, Queen Square, Bristol, and must be delivered to him, accompanied by the prescribed documents, before 10 a.m. on May 23.

June 1. Luxemburg.—*Supplying electricity* to the town of Luxemburg for lighting and tramway traction. Full particulars may be obtained from the "Collège des bourgmestres et échevins, Luxemburg."

May 1. London, S.E.—*Kerbing, channelling and metalling the roadway* and paving the footpaths with artificial stone (in separate contracts) of Sunnydene Street, Sydenham, and Grierson Road, Honor Oak, for the Lewisham Borough Council. The plans and specifications may be seen and forms of tender obtained at the Town Hall, Catford (Surveyor's Department). Copies of the specification may also be had on payment of the sum of 5s. in each case, which will not be returned. The tenders must be on forms issued by the Council, enclosed in an envelope, sealed and endorsed "Tender for —," and must be delivered by 4 p.m. on May 1 at the Town Hall, and placed in the box there provided for the purpose. Fair wages clause.

May 1. London, W.—*Supply and delivery of 500 tons of best hard Guernsey granite spalls*, 250 tons to be delivered forthwith, for the Brentford Guardians. Forms of tender may be obtained upon application, and tenders, upon such forms must reach William Stephens, clerk to the Guardians, Union Offices, Isleworth, W., not later than 4 p.m. on May 1.

May 1. St. Albans.—*Repair of district roads*, for the R.D.C. Full particulars and forms of tender may be obtained on application to the Council's surveyor, H. F. Mence, Town Hall Chambers, St. Albans. Tenders must be delivered to R. W. Brabant, clerk to the Council, Union Offices, St. Albans, by May 1.

May 1. Uckfield.—*Road material*, for the U.D.C., as follows:—300 yds. of clean hand-picked surface flints, unbroken; 650 yds. of 2-in. and 50 yds. of 3-in. of quartzite, Guernsey granite, or Mendip (at the discretion of the Council); 50 tons of Portfield gravel. Delivered in quantities as ordered, carriage paid to Uckfield Railway Station by Oct. 1, 1906. Payment will be made by instalments. Forms of tender to be obtained on application at the office of the Council. Tenders, with samples, to be sent to C. Dawson, clerk, at the office of the Council on or before May 1, marked "Tenders for Road Material."

May 1. Poole.—*Quarrying, sifting, breaking and yarding gravel*, to pass a 2-in. ring gauge (rings will be supplied by the Surveyor), and for team work connected therewith, in the parishes comprised in the district of the R.D.C. Forms of tenders and other particulars can be had at once on application. Sealed tenders to be sent to R. T. S. Seymour, district surveyor, Wimborne Minster, by May 1.

May 1. Docking.—*Materials and team labour* for the parishes comprised in the R.D.C. Forms of tender and further information can be obtained from W. W. Hopking, Great Bircham, or E. B. Burdon, Burnham Overy. Tenders must be returned by post, marked outside "Tender for Materials," or "Team Labour," as the case may be, and must reach J. A. Stoughton, clerk, Workhouse, Docking, King's Lynn, no later than 10 a.m. on May 1. Contractors must fill in a form for each parish if wishing to contract for more than one parish.

May 1. Bromley.—*Supply on hire of a 12-ton compound steam road-roller*, with a Morrison or other approved scarifier attached, in accordance with the conditions, a copy of which can be obtained at the office of the Borough Engineer. Tenders, endorsed "Tender for Road Rolling," to be delivered, addressed to Frederick H. Norman, town clerk, Bromley, Kent, not later than 3 p.m. on May 1.

May 2. Hove.—*Supplying about 3,000 cub. yds. of Coombe rock flints*, to be delivered during the coming twelve months. They may be tendered for in parcels of not less than 200 cub. yds. each. Further particulars may be obtained at the office of the borough surveyor, H. H. Scott. Tenders on forms supplied, endorsed "Tender for Coombe Rock Flints," will be received by H. Endacott, town clerk, Town Hall, Hove, up to 6 p.m. on May 2.

May 3. Southend-on-Sea.—*Supply and laying of tar macadam* on the western esplanade from the Palmara Parade to Grosvenor Road. Plans and specification may be seen and bills of quantities obtained (on deposit of

cheque for £1 1s.) upon application to E. J. Elford, M.I.M.E., borough engineer. Sealed tenders, endorsed "Tar Macadam," to be accompanied by (a) a sample of the block furnace slag proposed to be used and (b) a sample of the manufactured tar macadam, to be delivered at the Town Clerk's Office, Southend-on-Sea, by noon on May 3.

May 5. Lexden.—*Stones, flints, &c.*, and for the hire of one or two steam road-rollers, for R.D.C. Conditions and forms of tender from John Ennals, Surveyor's Office, Copford, near Colchester. Tenders to be sent to Charles H. Tompson, clerk, Victoria Chambers, Colchester, not later than May 5 at 4 p.m.

May 5. Windsor.—*Cartage of road materials* from the Great Western Railway Station, Windsor, the railway stations at Datchet and Sunningdale, also from Ascot Siding and Ascot Station to the several roads in the district, for the R.D.C. It is approximately estimated that the quantity of materials to be carted from the several stations will be as follows:—Sunningdale, Ascot Siding and Ascot, 1,100 tons; Windsor (G.W.R.), 800 tons; Datchet, 350 tons. Forms of tender may be obtained upon application to the surveyor to the Council, William Menzies, Englefield Green, Surrey, and sealed tenders, marked "Tender for Cartage," are to be delivered to J. E. Gale, clerk, 3, Sheet Street, Windsor, not later than noon on May 5.

May 6. Beccles.—*Scarifying and rolling in the borough.* Tenders to reach T. O. Cuddihy, C.E., borough surveyor, Beccles, by noon on May 6, endorsed "Stetm Rolling."

May 8. London, E.—*Making up the following streets:*—Drew Road (part of), Leonard Street (part of) Wythes Street (part of), and Lord Street. Plans may be seen, and specification, form of tender and further particulars obtained at the office of John G. Morley, borough engineer, Town Hall, West Ham, E., upon payment of £1. Fair wages clause. Tenders, endorsed "Tender for Private Street Works," to be sent to F. E. Hilleary, town clerk, Town Hall, West Ham, E., not later than 4 p.m. on May 8.

May 8. Beccles.—*Road material, supply and delivery to Corporation Wharf at Beccles of 45 tons of 1½ in. gauge granite:*—(a) Montsorrel; (b) Gurnsey; (c) or Basalt, by Aug. 1. Tenders and samples to be sent endorsed "Tender for Road Metal," to the office of T. O. Cuddihy, C.E., borough surveyor, Beccles, by May 8.

SANITARY.

April 30. Ross.—*Excavations for a sewer, about 920 yds. in length, from Alton Lane to the Monument, Cantilupe Road, according to the plans and specifications which may be seen at the Council Offices.* Tenders to be in a lump sum and, as an alternative, at a schedule of prices. Tenders, endorsed "Smallbrook Sewer," to be delivered at the Council Offices not later than noon on April 30.

April 30. Edmonton.—*Supply and delivery of stoneware pipes as follows:*—50 18 in., 300 15 in., 300 12 in., 1,000 9 in., 1,000 6 in., 1,500 4 in., or more or less by the full truck load. Forms of tender may be obtained on application to G. E. Eachus, engineer to the Council, Town Hall, Edmonton. Fair wages clause. Persons tendering are requested to quote net prices without trade discounts. Sealed tenders (which must be upon the form supplied by the Council's Engineer), marked "Tender for Stoneware Pipes," to be delivered at the office of William Francis Payne, clerk of the Council, Town Hall, Edmonton, not later than noon on April 30.

May 2. Wanstead.—*For the following works, for the U.D.C.:*—(1) Red Bridge Lane: 1,383 ft. run of 12 in. pipe sewer, with manholes, &c. (2) Blake Hall Road: 2,469 ft. run of 12 in. pipe sewer, with manholes, &c. (3) Aldersbrook Road: Construction of gulleys, and providing and setting 1,749 ft. run 12 in. by 6 in. Norwegian granite edge kerb. Copies of specification and form of tender can be obtained and drawings and contract form inspected at the Council Offices, Wanstead, N.E., Surveyor's Department, between 10 a.m. and 4 p.m. Sealed tenders, on the forms and in the envelopes provided, are to be delivered at the Council Offices not later than May 2.

May 3. Leiston-cum-Sizewell.—*Securing of part of Snape Road.* About 423 yds. of 9 in. pipes with manholes, gulleys, &c., in accordance with the drawings and specifications, which may be seen at the office of James Baldry, Snape Road, Leiston, surveyor. Tenders, sealed and marked "Sewering," to be sent to John Fry, clerk of the council, Saxmundham, by May 3.

May 9. Swinton.—*Construction of a bacteria bed at the Swinton Sewage Works.* Plans and specifications may be seen and form of tender obtained on application to Henry Entwistle, surveyor of the council, Council Offices, Swinton. Sealed tenders to be returned in the envelope provided to W. T. Postlethwaite, clerk to the council, Council Offices, Swinton, Manchester, not later than May 9.

May 14. Crawley and Ifield.—*Construction of about 7,784 yds. of earthenware pipe sewers, ranging from 7 ins. to 15 ins., with the necessary tanks, pumping station engines and pumps, percolating filters, and the laying-out of a sewage irrigation area and other works, in the parishes of Crawley and Ifield, Sussex, in accordance with the specification and plans prepared by Sidney R. Lowcock, M.I.C.E.* The drawings may be inspected and copies of the specification and schedules of quantities with form of tender obtained, on application at the office of the Engineer, 50, Queen Anne's Gate, Westminster, S.W., between 10 and 4.30, on payment of a cheque for £5. Sealed tenders, endorsed "Tenders for Crawley and Ifield Sewerage," are to be delivered, with the schedule of quantities, with every item legibly priced in ink, and with the columns added up to the exact total amount of the tender to A. C. Coole, clerk to the Council, Horsham R.D.C. Offices, 9, Carfax, Horsham, Sussex, before noon on May 14.

TIMBER.

April 30. London, W.—*Providing and laying cross-sawn deal blocks on the existing foundations in Holland Park Avenue (18,850 sq. yds.), Thurlow Place (5,850 sq. yds.), and Church Street (4,350 sq. yds.), for the Kensington Borough Council.* Specification can be seen and

further particulars obtained at the office of A. R. Finch, A.M.I.C.E., borough engineer and surveyor, Town Hall, Kensington High Street. Fair wages clause. Tenders, sealed and endorsed "Tender for Wood Paving," to be delivered at the office of W. Chambers Leete, town clerk, Town Hall, Kensington, not later than noon on April 30.

April 30. Great Yarmouth.—440,000 jarrah or karri paving blocks in accordance with specification to be obtained at the Borough Surveyor's Office. Tenders to be on the form and in the envelope supplied, and delivered at the office of the Town Clerk, Town Hall Great Yarmouth, not later than noon on April 30.

April 30. Dundalk.—*Supply of the following timber from May 2, 1905, to May 2, 1907, to be delivered, carriage paid, at such time, in such quantities and in such places as may be required, subject to the approval of the Engineer for the Dundalk Harbour Commissioners:*—Round and square timber, deals, planks and battens, iron castings and chains, lines and ropes, &c. Particulars can be obtained at Harbour Office. Tenders to be lodged with the Secretary by April 30, addressed to the Chairman of the Board.

MISCELLANEOUS.

April 26. Dundee.—*Supply of the following stores for the Town Council:*—Battens, &c., bricks, cartage, cement, fireclay pipes, &c., flagstones, iron, steel, &c., iron castings, ironmongery goods, lime, oil, waste, &c., pitch and pitch oil, sand, Whinstone kerb and channel, Whinstone rubble and road metal, and wood for fencing, &c. Schedules of quantities and forms of tender may be obtained from J. Thomson, burgh engineer. Sealed tenders must be lodged with W. H. Blyth Martin, town clerk, Dundee, not later than April 26.

April 26. Glasgow.—*Supply of the following materials required by the Cleansing Department, for one year from June 1 next:*—Iron, ironmongery, iron bolts and nuts, iron castings, shovels, brass foundings and furnishings, tinware, galvanized iron goods, re-tireing wagon wheels, glass, lime and cement, bricks, fireclay goods, wood (British), wood (foreign), ash handles, &c., brushes, paints, &c., oils, carbons, sheet steel barrows, steel castings, mild steel perforated screens, cartage, &c. Specifications and forms of tender may be had on application to D. M'Coll, Superintendent of Cleansing, 38, Cochrane Street, Glasgow. Sealed tenders, marked outside "Tender for — (Cleansing Department)," must be lodged with A. W. Myles, town clerk, City Chambers, Glasgow, not later than April 26.

April 27. South Shields.—*Supply of machinery and tools required at the Electric Tramways Car-sheds.* Particulars can be obtained on application to John Wilson, general manager, Tramway Depot, Dean Road, South Shields. Tenders to be delivered to the Town Clerk's Office in the Court Buildings, South Shields, not later than noon on April 27, endorsed "Tender for Machinery and Tools."

April 23. Teddington.—*Supply of the following materials, for the U.D.C.:*—1,000 yds. of broken granite and 2,000 yds. of flints, to be delivered as required, either by barge alongside the Teddington public landing wharf on the River Thames, or by rail at the London and South-Western Railway Station, Teddington. Also for the execution of all smith's work and team labour, the supply of tools and implements, pipes, gulleys, &c. Specifications and forms of tender, together with particulars, may be obtained on application to Marshall Hainsworth, surveyor, Council Offices, Teddington. Sealed tenders, endorsed "Tenders for Granite, Flints, Smith's Work, Team Labour, Tools and implements, Pipes, Gulleys, &c.," as the case may be, to be delivered to G. H. Salmons, clerk, Council Offices, Teddington, not later than April 23.

April 23. Manchester.—*Supply of ferrule taps, to specification, ½ in., ¾ in. and 1 in. diameter, required up to the 31st March 1907, for the Waterworks Committee.* Particulars may be obtained on application to the Secretary, Waterworks Offices, Town Hall, Manchester. Tenders must be delivered not later than April 23.

April 30. Govan.—*Supply of the following stores, for the Electricity Department:*—Cables; cable accessories; meters; house fuse boxes; wrought-iron tubes and fittings; cast-iron pipes; bricks and cement; ironmongery, brushes, &c.; paints, soap, varnishes, &c.; timber; carbons for arc lamps; joint boxes; motors; motor starters. Schedules and forms of tender can be obtained from T. C. Parsons, burgh electrical engineer, Helen Street, Govan. Sealed offers, marked "Tender —," to be sent in to J. A. Houston, town clerk, Town Hall, Govan, on or before April 30.

May 1. London, S.W.—*Miscellaneous tools and stores, for the Southern Mahratta Railway Co., Ltd., as per specification and drawings, which may be seen at the offices of the Company.* The charge for the specification is £1 1s. each, which will not be returned. Tenders must be marked "Tender for Miscellaneous Tools and Stores," and sent in to Edward Z. Thornton, secy., 46, Queen Anne's Gate, London, not later than noon on May 1.

May 2. Arbroath.—*Supply of the following materials, for the Town Council:*—Pavement, kerb, channel and setts; fireclay pipes, bricks, lime and cement; cast-iron pipes and other castings; brass main service cocks. Schedules may now be had from the Borough Surveyor, and tenders are to be lodged with W. K. Macdonald, town clerk, Arbroath, before 10 a.m. on May 2.

May 9. Bradford.—*Supply of the following stores, for the Corporation:*—Pitch and oil required for street paving purposes; cast-iron gulleys, ventilators and storm grates; glazed earthenware pipes, blocks and junctions; timber for sewerage and other works. Forms of tender and all necessary information may be obtained on application at the office of J. H. Cox, city surveyor, at the Town Hall. Fair wages clause. Sealed tenders, endorsed "Tender for Materials—Street Works," to be sent to Frederick Stevens, town clerk, Town Hall, Bradford, on or before May 9.

THE LABOUR MARKET.

Board of Trade Returns for March.

THE Board of Trade returns show that employment in the building trades in March continued to show a general seasonal improvement, especially marked in the case of painters. Compared with a year ago, however, employment showed little change.

Returns received from sixty-two London employers showed that in the last week of March they paid wages to 11,623 workpeople of all classes, compared with 11,152 in February and 14,129 in March, 1905. Employment generally in London was rather better than a month ago, but a good deal worse than a year ago.

Returns were received from employers' associations in seventy-three districts outside London. In two-thirds of these employment was reported as dull generally; at Stratford-on-Avon and Maidstone it was very good, at Birkenhead good, at Ashton and Huddersfield fairly good, and at the remaining towns moderate or fair. Compared with a month ago, no change was reported in fifty-two towns, while in fourteen, including Stockport, Portsmouth, Bournemouth and Dublin, it was better; and in seven, including Hull, Chatham and Swansea, it was worse. Compared with a year ago employment was reported about the same in forty-four towns, worse in nineteen and better in ten.

The following information is based on returns from trade unions and from local correspondents:—

Bricklayers.

With bricklayers employment generally was bad, but better than a month ago. The improvement extended to every district, except Ireland, and was specially marked in Lancashire.

Stonemasons.

Employment with stonemasons was bad generally, but showed some improvement as compared with a month ago. It was worse than a year ago.

Carpenters and Joiners.

With carpenters and joiners employment was better than a month ago in all districts, the greatest improvement being shown in the Northern counties and Scotland. Compared with a year ago, there was on the whole little change. The percentage of trade-union members unemployed at the end of March was 7.4, compared with 9.5 in February and 7.9 in March, 1905.

Slaters and Tilers.

With slaters and tilers employment was bad. In England and Ireland it was worse than a month and a year ago; in Scotland it was better.

Plumbers.

With plumbers employment was worse than a month ago in London and Wales; in other districts it was better, most improvement being shown in Lancashire and Scotland. Compared with a year ago there was considerable decline in the East Midlands, Wales and Ireland, and some falling-off in London; most improvement was shown in the Northern counties. The percentage of trade-union members unemployed was 11.1 at the end of March, compared with 12.1 in February and 11.8 in March, 1905.

Plasterers.

With plasterers employment was better than a month ago. Generally it was dull, but in Scotland it was fair; it was moderate at Stockton, Bolton, Barrow, Coventry and Exeter, and fair at Oldham.

Painters.

Employment generally with painters was fairly good, and very much better than a month ago.

Labourers.

With labourers there was a slight improvement, but employment generally was bad.

Builders' Current Price List of Specialities.

This list is not intended to promote undercutting, and prices are subject to discounts for a quantity and for cash. Readers are advised to write for these discounts. Where prices for goods are standardised and fluctuation takes place in trade discounts, our prices have the discounts deducted. In some cases it is difficult for firms to quote prices, and we have stated where they will be pleased to send catalogues and quotations immediately on receipt of applications.

The New Regulations for Secondary Schools.

THE Board of Education have just issued a set of building regulations for secondary schools and pupil-teacher centres dealing with the principles to be observed in the design and fitting-up of new buildings; rules as to construction, &c.; and certain requirements as to plans, specifications and estimates. There is wisely no attempt to force these regulations upon existing schools of the class. The Board intimate that such cases will be dealt with on their merits and as they arise, but they warn authorities to carefully consider the principles embodied in this new set of regulations before submitting schemes for the alteration of existing buildings. Part I., which deals with the principles to be observed in designing and fitting-up the buildings in question, seems on the whole moderate and unobjectionable. It allows a great deal of latitude, and the Board recognize that, owing to the wide difference between the various grades of secondary schools and pupil-teacher centres, it is undesirable to attempt to lay down any hard-and-fast rules as to the actual method of planning to be adopted, and they state their readiness to approve variations where shown to be satisfactory. Part II., which deals with the rules as to the hygienic and sanitary condition of the premises, the construction of the fabric and the safety of the scholars in cases of emergency, are intended to be applied rigorously, and only in circumstances of a very exceptional character will variations be allowed. We think this is somewhat a pity, because on close inspection we see there is much that is of questionable advantage and a good deal that will unnecessarily increase the cost; and, finally, insufficient attention is paid to ventilation, heating and fire-protection.

Architecture at the Georgian Exhibition.

THE Spring Exhibition at the Whitechapel Art Gallery is devoted to "Georgian England," and a proportion of the limited space available has been allotted to architecture. For a century after the Great Fire London was probably the stateliest capital in Europe, and even so lately as the time of George IV. easily held her own with Paris. Artists of the eighteenth century were fond of delineating the streets, squares and river banks, and in the gallery are many examples by Paul and Thomas Sandby, Samuel Scott, Girtin, Varley and Rowlandson. T. Sandby's "Covent Garden" (No. 17) is an admirable example of a tinted pencil drawing, displaying architecture for its own sake, none of the cabbages and carrots which give so much colour to the scene being depicted. We see in its beauty Jones's piazza, which has since been partially destroyed. Varley's "St. Pancras" (No. 22) must have been painted upon the site of Euston Station at a time when the "New Road" (as the Euston and Marylebone Roads were originally named) formed the northern limit of the Metropolis. If it were not for that unmistakable steeple appearing above the trees, one would have imagined London to be miles away. But artists sometimes see less as well as more than ordinary mortals. In No. 38 we see how such a faithful delineator as Samuel Scott was not free from the common fault of unduly exaggerating the width of a street in order to put the buildings in a less sharp perspective. In his anxiety to do justice to the tower of St. Magnus Church, as well as the Monument, he makes Fish Street Hill appear as wide as Kingsway! In No. 45 he shows us the Adelphi Terrace in red brickwork; the stucco was applied in the last century only. A series of photographs of the architecture of Bath includes many doorways and other details. Of the plans, that of No. 41, Gay Street is the most interesting. Here a small town house on a corner site, about 30ft. square only, is invested with dignity and individuality mainly by placing the principal rooms on each floor on the diagonal axis, with a semicircular end towards the street corner and another within towards the stairs. Landings and passages are reduced to a minimum, and perfect symmetry attained without any undue sacrifice of convenience. Leoni's designs for the projected "villa" at Carshalton show that it would have been one of the most stately residences in England and a worthy rival of Wanstead House, which it in some ways resembled. Some of the garden accessories of this projected palace have only lately been disposed of and removed. No. 92, "Carnarvon Castle," by Girtin, almost makes one sigh for the days when our ruins stood up desolate but in perfect harmony with their surroundings, not marred by an environment of railway, iron-roofing and tourists' refreshment houses. Here

we have only castle, mountain and sea. There are many paintings by Hogarth, Reynolds, Gainsborough, Hoppner, Wilson and others. The portrait of Gibbs by Hogarth is the one usually to be seen at St. Martin's-in-the-Fields, which church is generally regarded as the masterpiece of that architect. The statement in the catalogue of this exhibit that in the eighteenth century "architecture became a popular hobby" is confirmed by an incident in Gibb's career. He published a book of his designs, and made a profit of nearly £2,000 by the edition and subsequent sale of the plates! The writer of the catalogue notes, after much appreciation of English Renaissance architecture, tells us that it degenerated slowly "to die in King's Cross Station and the Wesleyan chapels of Hackney and Homerton." Why King's Cross Station? This, in spite of later accretions and untidy environment, is the most expressive and dignified of all our London termini. Previously we have been told that "building must be the outcome of structural necessity nobly expressed." King's Cross might have been more approximately cited in this connection. The exhibition is open free daily from noon until 10 p.m., and closes on May 9th. A similar exhibition on a permanent basis could most fitly occupy the galleries of Kensington Palace.

Architects at $\frac{1}{2}$ Per Cent.

IN connection with the rebuilding of the Carmarthen Workhouse after a fire which occurred there recently, our attention has been called to what appears to us to be a piece of most unprofessional conduct. The Carmarthen Board of Guardians, in their ignorance, actually advertised for tenders from architects for the rebuilding, notwithstanding that there was a firm of architects of repute who had been acting for them for the last forty years. The result has been a competition among a few architects to undersell each other. Messrs. George Morgan & Sons, two members of which belong to the Institute, are the only ones who come out of the affair with honour. Messrs. Morgan, who have acted as the Board's architects for the period stated above, clearly gave the Guardians to understand that the standard of payment was 5 per cent., and furthermore that no architect of any training or standing would depart from this scale in any important building. We refrain from mentioning the names of the architects who replied to the advertisement, as also the absurd amount for which they offered to undertake the work, hoping that they at least will see the error of their ways. The Guardians have betrayed their trust as a public body by deciding by 18 votes to 11 to appoint a local architect whose offer was the lowest, amounting actually to $\frac{1}{2}$ per cent. commission. This architect also stated that he did not require a clerk of works!

COTTAGES ON SMALL HOLDINGS.

AT this time, when the question of the unemployed and the landless claims so much public attention—a question involving multitudinous difficulties—some practical scheme for dealing with the matter and supplying a remedy is sure to be appreciated.

It is evident that emigration to other countries is not the antidote, as emigration must drain a country of its strongest, leaving the unfit behind to go lower in the ranks of the unemployed.

Although the name "farm labour colony" is popularly associated with home colonization schemes, these institutions should be called "labour training farms," as out of such institutions (although many are under the control of the Poor Law authorities) must come the promotion and establishment of small holdings if they are to be of any permanent or practical use in relieving the unemployed. As the result of the prevailing distress, Mr. Joseph Fels conceived the idea of buying tracts of land in various districts and setting aside the greater part of such tracts for public authorities to take over as farm labour colonies, intending the balance of the land to be turned into small holdings, in the hope that many of these holdings would ultimately be taken up and profitably cultivated by the men trained on the colonies.

It is proposed that various branches of agricultural work shall be done on these small holdings—such as fruit-growing, market gardening, dairy work, bee-keeping, pig and poultry raising, and the more intensive cultivation for which greenhouses are required.

The cottages here illustrated are now being

built at Mayland, in Essex, and although this scheme is not primarily a commercial enterprise, it is important that the small holdings should be made to pay. The cottages are being built with the fullest regard to economy, with wholesome provision for the future occupants. It is intended that the rental of each holding of 5 acres shall be such as will pay a fair return for the capital outlay on buildings and cost of land.

The cottages are built of yellow stock bricks and roofed with dark Broseley tiles, which have been selected on account of their non-absorptive qualities, as at present the cottagers will be entirely dependent for their water-supply on the roof water from cottages and outbuildings. Each will be provided with an independent system with filter and storage tank, and a pump will be fitted in the scullery.

The attempt has been made to keep the roofs of the simplest form, the chimneys in the centre of the ridge, the staircase completely in the slope of the roof, and the windows under the eaves and in gable ends.

The cottages and the necessary farm outbuildings are being erected on behalf of Mr. Joseph Fels under the supervision of Mr. George Mosses and Mr. George Sabey, who are employing the labour direct. In the present stage of the work it is impossible to arrive at any definite statement of the cost. The architect is Mr. Charles H. Holden, A.R.I.B.A., 39, Wilson Street, E.C.

We hope later, when the work has been carried out, to give some photographs of these cottages, which are very interesting examples of simple design. The plans, it will be noticed, are squarely treated throughout, while the elevations exhibit the hand of a very capable architect.

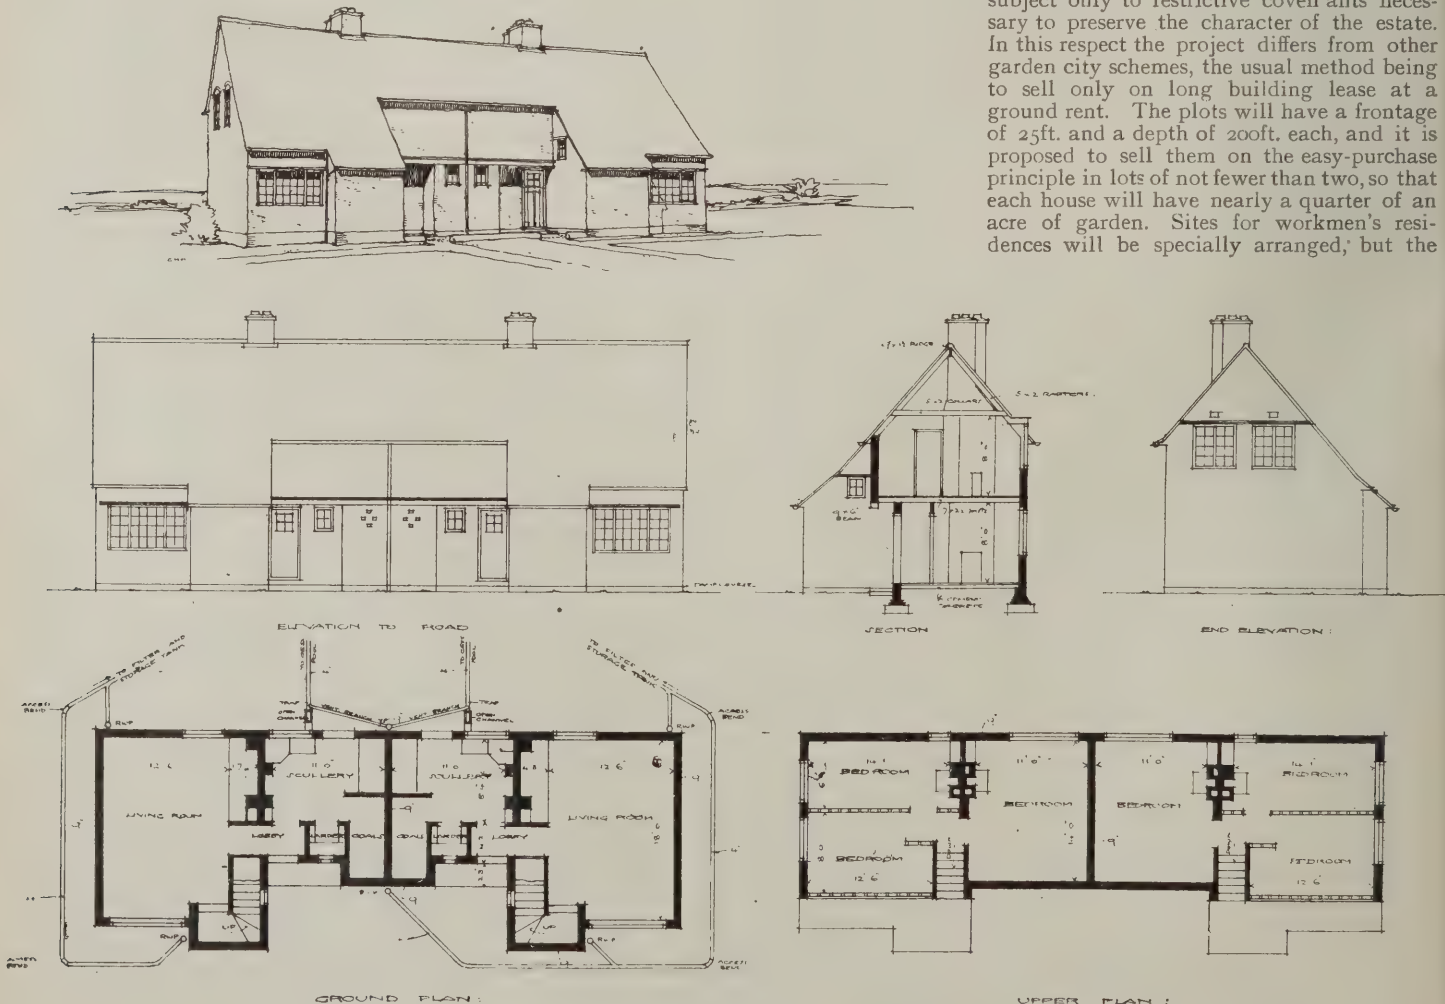

ANOTHER GARDEN CITY.

A Chatham Site Selected.

YET another garden city is proposed. This will be the first of a series which the British Garden Cities (Ltd.) hope to erect. For their initial experiment a freehold site, formerly known as the Wigmore Estate, near Chatham, has been secured. This site, 365 acres in extent, is about three miles from Chatham and half that distance from Rainham Station on the South-Eastern and Chatham Railway. It is within ten minutes' walk of the electric tramways from Chatham to Rainham, which are to be completed this spring. The site is high, overlooking the estuary and forts of the River Medway, and is dry and healthy. It will be laid out on the American "block" system, and it is proposed to provide a twenty acre park, a hotel, and a racing track and football-ground, around which will be a circle of business premises and co-operative stores.

Public Buildings.

The public buildings will comprise at least a school, a library and a village hall. The company will at first restrict its operations to parcelling out the estate, selling plots for buildings, providing sewers and making roads, leaving purchasers of plots free to build houses or cottages as they wish, subject, in order to secure some uniformity, to certain specifications and designs of the company's architects and surveyors. As the development of the estate proceeds the company will be prepared to financially assist plot-buyers to build and to undertake the supply of gas, water and electric light. A leading feature of the scheme is that all plots sold by the company will be the absolute freehold property of the purchasers, subject only to restrictive covenants necessary to preserve the character of the estate. In this respect the project differs from other garden city schemes, the usual method being to sell only on long building lease at a ground rent. The plots will have a frontage of 25ft. and a depth of 200ft. each, and it is proposed to sell them on the easy-purchase principle in lots of not fewer than two, so that each house will have nearly a quarter of an acre of garden. Sites for workmen's residences will be specially arranged, but the

FARM COTTAGES AT MAYLAND, ESSEX. CHARLES H. HOLDEN, A.R.I.B.A., ARCHITECT.

company has decided to allow only substantial cottages to be built at a minimum cost of £250 each, the better class of house varying in cost from £300 to £500, and possibly more. The average will be about £400. It is hoped that residents will be drawn not merely from the adjacent towns but from among the workers of London, seeing that when the electric tramway is completed the garden city will be within an hour's run of the metropolis, with a service of about fifty trains daily. Garden cities appear to be getting rather the vogue now, owing to the increasing congestion in towns, and provided they are conducted on sensible and practical lines there is every hope for their permanent success.

THE ARCHITECTURAL ASSOCIATION.

Mr. Walter Cave on Fenestration.

A MEETING of the Architectural Association was held on Friday evening at 18, Tufton Street, Westminster, the chair being occupied by the president, Mr. E. Guy Dawber, F.R.I.B.A.

The following new members were elected:—Messrs. H. S. Watling, E. J. Tanner and A. R. Ashby.

The president read the report of the scrutineers, and announced the election of officers for the session 1906-07 to be as follows:—President, Mr. R. S. Balfour; vice-presidents, Mr. Walter Cave (394 votes) and Mr. A. Needham Wilson (392 votes); council: Messrs. E. Guy Dawber (346 votes), Arnold Mitchell (279 votes), Louis Ambler (265 votes) J. B. Fulton (260 votes), A. Maryon Watson (253 votes), J. Murray (243 votes), W. Curtis Green (209 votes), Arthur Keen (193 votes) and E. W. M. Wonnacott (153 votes); hon. treasurer, Mr. Henry T. Hare; editor of A.A. Journal, Mr. Maurice E. Webb; hon. librarian, Mr. E. Gunn; hon. secretaries, Messrs. H. Tanner, junior, and C. Wontner Smith; hon. solicitor, Mr. W. H. Jamieson; hon. assistant librarians, Messrs. H. J. Wonow and Percy May.

Mr. Walter Cave then read a paper on "Fenestration." He dealt with his subject chronologically. Beginning first with Egypt, he took

The Gigantic Temple at Karnac as typical of the early hypostyle buildings, lighted only through unglazed clearstories. The introduction of light throughout the building was not considered a necessity—partly due, perhaps, to rites of the Egyptian religion, and partly due, perhaps, to the wonderfully brilliant skies of the East. In later times there was evidence that the

domestic buildings had openings in the front walls over low screens, and in the temples of Edfu and Dendera the same arrangement could still be seen.

How the Greeks lighted their Buildings.

Turning to Grecian architecture and the method of lighting those wonderful temples, we found a greater difficulty and more uncertainty. In the Erechtheum and the great temple at Agrigento, in Sicily (420 and 480 B.C.), according to the accepted restorations, there were windows on the side walls, but these were both exceptional instances, and even here the problem of how the central part was lit remained a matter of conjecture.

Both these examples might be taken as proving the rule that the Greeks did not consider that openings in the screen-walls were the best form of lighting their temples.

All Greek architecture came from the South, the land of brilliant sunshine, where windows, as we understood them, were either unknown or of quite subsidiary im-

portance. They were very few in number in all Classical work, and never placed to form more than one tier: for which reason, Mr. Cave said, we might draw the conclusion that windows were never really successful in columnar architecture. The Greeks felt this, and never developed the scheme, and the modern attempts to combine fenestrated with columnar architecture showed the impossibility of making a happy compromise between two totally conflicting styles.

That the Greeks had a method for lighting their temples was generally accepted by all archaeologists, and it seemed evident that if it was not from the side walls, it was from some form of clearstory adapted to a sloping roof, as suggested by Mr. Fergusson in his "History of Architecture." St. Peter's, Eaton Square, was an attempt, and a successful one, to light a church by this method. It was not till the time of the Roman Empire that the admission of light came to be considered as an integral part of the design.

Roman Top-lighting.

The great eye of the Pantheon was a good

ELEVATION TO ROAD :

SIDE ELEVATION :

SECTION :

GROUND PLAN :

UPPER PLAN

starting-point for a more detailed consideration of the subject. In this truly remarkable building we had an interior completely and perfectly lit by one central opening in the dome, 27ft. in diameter. The total cubical contents of the Pantheon represented nearly 2,000,000 cub. ft., giving the extraordinary result that each sq. ft. of skylight lighted 3,380 cub. ft. of space.

The arch and dome construction of the Romans gave an opportunity for windows, which were introduced high up beneath the vaulting and above the four-barrel arches supporting the dome; these were usually great semi-circular openings and divided by massive mullions into three divisions, one of which, according to Viollet-le-Duc, was finished with frames of bronze enclosing panes of glass, alabaster or simply lattice-work. This was presumably the usual way of lighting the great central courts of the Roman buildings.

The true Roman architecture was based on the use of the Greek lintel construction combined with the Etruscan arch, and, without going into the details of the origin of the latter, it was sufficient for our purpose to note that this combination gave an opportunity of lighting buildings from the side walls. The intercolumniation of the Greeks, as had been pointed out, precluded a satisfactory form of fenestration, but, with the pillars placed at a distance from one another equal to their own height, the intervening screen-wall was well adapted, if not obviously intended, for window openings. In later times by superimposing one order above another, giving a series of storeys, the opportunity for systematic fenestration was attained, and the windows thus became an integral part of the design.

Romanesque Windows.

In many of the Early Romanesque buildings in Italy there was a curious arrangement

of windows, these being designed from the inside with little regard to the exterior; and it was highly probable that the Early Christian antagonism to all the heathen practices might have led them to ignore their exteriors, on which the Greeks spent so much thought and labour.

In the Byzantine style the same remarks to a certain extent held good. Mr. Cave, however, here left the eastern architecture and followed the progress of fenestration westward, turning at once to

The English Gothic Buildings.

The windows in our Early Norman work were small, due to the desire for protection against enemies in those troubled times when churches (and especially their towers) were used as places of defence and refuge, the difficulty and expense of obtaining glass, and to the window itself having come from the East, or the land of sunshine.

With the advent of the pointed, or lancet,

windows of the thirteenth century a real attempt was made to make a design in fenestration both from the inside and out. In the lofty square-ended fronts of the Cistercian buildings we found the windows ranged in deeply-set arrays of varied arcading. But, as a rule, the Early Gothic windows in the arcades were subordinated to the general wall scheme.

Tracery.

Towards the end of the thirteenth century came a most remarkable change in the window treatment of our great Gothic buildings, "which," as Mr. Prior had said in his valuable work on Gothic art, "must be judged as no mere freak of a designing architect, but as a revolution worked by Gothic creativeness in some thirty years, such as the centuries of Egyptian or Greek art did not accomplish." That was tracery, in conjunction with glass, this combination reaching such a pitch at Selby that the tracery

FARM COTTAGE AT MAYLAND, ESSEX. CHARLES H. HOLDEN, A.R.I.B.A., ARCHITECT.

practically became the cloissons of a great masoned enamel. Gradually the glass-painter exercised more and more influence over the mason, and thus we found, at Gloucester and King's College Chapel, Cambridge, windows of such a size that the intervening wall spaces were only piers to carry the lofty stone vaults.

The Change.

With the decay of Gothic, which Mr. Cave said might for purposes of classification be taken as about 1500, a foreign influence began to make itself felt in England, and the interest in the national style, which had been mainly confined to the ecclesiastical structures, was transferred to the domestic buildings after the dissolution of the monasteries under Henry VIII.

The Italian Renaissance was the first of the outside influences, but before the classical traditions had really been thoroughly assimilated by the English builders there arose, under Queen Elizabeth, a marvellous growth of stately country houses, in which the followers of the fast-perishing Gothic style made their last effort to accomplish something new. The great country houses of the sixteenth century, with their stone-mullioned windows in many divisions, fitted with well-proportioned leaded glazing, were to be found scattered up and down the length and breadth of the country; and the wonderful ease with which this form of fenestration was adapted to the great façades of Kirby and Montacute, as well as to the modest gables of the Cotswold manors, took such a hold on the national mind that this style of window might be said never to have completely died out.

The necessity for a defensible house had by this time disappeared, and the reaction was, like all reactions, inclined to the opposite extreme, so that we found, in cases like Astley Hall, Lancashire, and Little Moreton, a range of windows practically dividing the façade into alternate horizontal bands of glass and solid wall surface.

The development of the bay window was also one of the striking characteristics of these times.

Proportions of Mullioned Windows.

The proportions of these mullioned windows was worthy of careful consideration. The single transom was generally placed so that its lower line was nearly in the centre of the window. The proportion of glass to mullion was usually 1 of mullion to $2\frac{1}{2}$ of glass. The glass-line took the centre of the mullion, and the face of the mullion, if not flush with the external wall, had only a small member beyond it. The mullions were about twice as deep as they were wide. Where more than one transom was used the divisions became less towards the top—with some curious exceptions, as at Kirby Hall.

In the earlier type of houses, and in the smaller examples—as, for instance, in the Cotswold district—the windows were small, and the amount of plain wall surface thus produced made up a composition in fenestration which could hardly be equalled for its dignity and sense of repose.

But the classical ideas which had, by the end of the sixteenth century, gained a firm foothold in the interior of the house, at last showed themselves both in the arrangement and details of the windows, and the outer member of the jamb developed into the architrave, though the mullion and transom held its ground. Woollaton Hall might be taken as typical of the transitional period, though the effect of the fenestration could not be considered entirely satisfactory.

The Banqueting House in Whitehall, finished in 1622, marked the beginning of a new era in English architecture. As had been pointed out, one of the characteristics of the great Tudor buildings was a long and low proportion produced by strongly-marked horizontal lines of windows with no studied

architectural effect. But, said Mr. Cave, in the fragment of the palace in Whitehall we were face to face with a great, and successful, attempt to create a building full of the subtle proportions and use of purely architectural forms which Inigo Jones had studied in Italy under the influence of the great architects of the Renaissance.

The window treatment was of exceptional interest. The proportion of voids and solids was well balanced, and worked out at about 1 to $3\frac{1}{2}$ —that was to say, only slightly less window space than in the Vendramini Palace at Venice. But the façade of the Banqueting House gave a far greater sense of dignity and strength on account of the plainer treatment of the wall surfaces between the windows, only broken by the columns and pilasters without the panelling and more restless ornament of the Venetian example.

The proportions of the windows themselves worked out at rather under two squares in height, which was somewhat wider than was usual in most of the Italian square-headed lights, which were generally about twice as high as their width—for example, the Palazzo Zecca at Venice, the Palazzo Ugigionni at Florence, and the Palazzo and Villa Farnese at Rome.

Difficulties.

The great difficulty of adapting this new architecture to the requirements of the day was felt from the first. A style of building which depended for its effect on well-judged proportion and a systematic arrangement of windows presented immense difficulties to the architects of the late Tudor buildings, whose art was, to all intents and purposes, unconscious, and in no way scientific. But architecture had suddenly become a science as well as an art, a science of proportion, and a knowledge of the great buildings in Italy was essential for those who embarked on the new undertaking.

In most of the great domestic buildings in England of the Tudor period the essentially English characteristic was the plan, and, following as a natural result with an indigenous style, the internal arrangements found an expression on the outside—in short, the buildings were designed from the inside to the outside. But, with this new and wonderful architecture borrowed from a distant country, this was reversed, and too often everything was sacrificed to the proportion and treatment of the façade. Thus we found English country houses following in all respects the villas and palaces of Italy—buildings designed by Italians for Italy, which were in many ways quite unsuitable for our northern climate.

The Effect of this Revolution

in architecture on the fenestration of our English buildings was very marked; for a long time the mullion and transom was still used, and with good effect—for instance, at the Ashmolean at Oxford and Wolseley Palace at Winchester. But the sash-window, divided by the heavy bars, became the accepted type to the purist, and the difficulties of the adaptation of the Roman architecture produced much defective lighting of interiors.

Such defects as the inevitably dark windows under the vast porticoes at Prior Park, near Bath, and Amesbury Abbey, Wiltshire, were inseparable from the use of a huge order, magnificent though the effect might be from the outside.

Two Examples considered in Detail.

Turning to a more detailed account of the window treatment of the seventeenth and eighteenth centuries, Mr. Cave took Hampton Court Palace and the Horse Guards as representing the leading tendencies of these times.

On the east or garden front of Hampton Court, begun by Wren in 1689, the internal arrangement was at once seen from the elevation. The ground-floor rooms were not of first-rate importance, and the windows were

subordinated to the great range of state chambers on the first floor—the *piano nobile* of the Italian palaces. These lofty windows had a proportion which was extremely dignified; the divisions of the sash-bars worked out at 20ins. high to 14ins. wide. The window-openings, 13ft. high to 5ft. wide—a far narrower proportion than was usual in Italy, and one that Wren was particularly fond of (as, for instance, in the orangery at Kensington Palace, where the end-square windows were 5ft. wide by 13ft. 6ins. high)—roughly speaking, two and a half times the width.

The circular windows gave a most interesting note to the façades at Hampton Court, and the division of the bars was most ingenious; above the secondary cornice the windows were practically square, and the sash-bar divisions of the same proportion, but on a much smaller scale than those below.

It would seem that Wren's idea was to produce an effect of height, and at the same time to indicate the relative importance of the rooms within.

At the Horse Guards, in Whitehall, we found the whole composition more broken up than usual in a Palladian design by the varied heights and planes of different parts of the building. The main part of the building was designed by Kent, in 1742, with the exception of the attic story on each angle of the central part and the clock turret, which were added by Vardy some ten years after his death. The composite windows under a single semi-circular arch were here used with considerable effect, and gave the necessary importance to the larger rooms on the first floor, while the second floor was entirely subordinated, and the window openings kept as plain as possible. These rooms were really treated as a mezzanine floor, and it was interesting to compare the arrangement with the Home Office on the south side of the parade ground, also probably by Kent, where the mezzanine windows were omitted in the front, and only showed on the ends. The result was that a fine solid-wall effect was produced with a complete entablature, but at the sacrifice of the interior lighting to these rooms.

This plan of disguising the real arrangement of the interior could never be considered as satisfactory, and an angle view, where both faces could be seen simultaneously, gave an unpleasant sensation of something wrong.

In the main façade of the Horse Guards the eye was at once satisfied, but on the end wings the same defect was seen, and the frieze and architrave of the cornice had to be stopped short on the return ends to allow for the windows on the mezzanine floors. The proportions of the windows themselves were interesting; their relative value to the solid wall surface represented 1 to $3\frac{1}{2}$, or rather more window than Inigo Jones' Banqueting Hall, and rather less than the Vendramini Palace at Venice.

Conclusion.

In concluding his paper Mr. Cave said:—
"Let the plan of a building be fully considered and designed from the first with due regard not only for the requirements but for the exterior, and let the window treatment bear on the exterior its proper relation to the internal arrangements. If the plan is faithfully designed to meet the given conditions it must of necessity reflect the life and habits of those for whom it is intended, and if the window treatment is also faithfully designed to suit the rooms, the result will be sincerity in the fenestration."

Mr. E. Prioleau Warren proposed a vote of thanks to Mr. Cave, which Mr. Allan Potter seconded. The president, in supporting it, mentioned that it was always surprising to find in measuring any well-proportioned windows that they were so much smaller in reality than they appeared. Mr. Cave briefly replied. The lecture was illustrated by a number of splendid slides.

R.I.B.A. REINFORCED CONCRETE COMMITTEE.

THE following statement, which was read at the first meeting of the Concrete Committee nominated by the Royal Institute of British Architects to consider and report upon the use of reinforced concrete in buildings and other structures, gives an idea of the nature and scope of the investigations which the Committee has been formed to carry out:—

First, then, it appears that we should inquire into what has been done already and ask the owners or architects or engineers of such work for particulars, and how the buildings have stood the test of time.

We shall have a secretary who can apply to railway companies, owners of mills, private owners, architects, engineers and others, who will no doubt willingly place the results of their experience at our service. Some of us may visit works; some have actual experience in the new system; and when we have digested this knowledge we can as a body express an opinion as to its usefulness, its safety, its permanence and other qualities, which opinion we may fairly hope will be of value to our fellow countrymen.

Similar Committees Abroad.

Something of this kind has been done already in other countries. The German Association of Architects and Engineers in conjunction with the Concrete Association have drawn up a report; the American Institute of Civil Engineers in conjunction with various other bodies have appointed a committee which is at present engaged on similar work, and it is suggested that we should apply for copies of such information or interim reports as may be at its disposal; the French Government also is said to have appointed a committee to prepare a set of recommendations.

A general expression of opinion as to its value would not help other architects or engineers very much; we should therefore consider and report upon the following amongst other matters, as to which there is doubt:—

Permanency of the Construction.

(1) Whether such constructions are permanent or likely to deteriorate with time. The steel skeleton is said by all those who have studied the subject not to rust, and even when steel is embedded in a material such as coke-breeze concrete containing a proportion of sulphur there is said to be no rusting. As any reduction in the section of the metal by rusting might endanger the work, we should consider if it ever does rust, and under what circumstances, so as to advise upon any necessary precautions, or to reassure the doubters on this head.

Resistance to Fire.

(2) The resistance to fire. We shall have to consider what has been done in experimental tests such as those of the City of Hamburg Authorities in 1895, and of the British Fire Prevention Committee just made. Also the results of tests in actual fires in buildings such as the Baltimore fire, where the conditions were exactly those we have to provide against. We may thus be able to form definite conclusions of value to all interested.

Contracts.

(3) The method of contracting. There are about fifty different so-called patent systems, and it is usual to entrust the design of any proposed work to one of the firms who make a speciality of this class of construction, obtaining from that firm a guarantee of strength. This arrangement is probably quite desirable; but as a certain responsibility must always lie on the engineer or architect who accepts or recommends for acceptance any such design, it is desirable

for us to define as best we may the responsibility of the parties.

For instance, it may be made clear that the contracting firm undertakes all responsibility; you may consider it wise to require that the drawings should first be submitted to the architect or engineer, and should be signed by the contracting firm or by some responsible person on their behalf. Some firms try to make a secret of their system, and object to showing the drawings.

It may appear to you that to accept a plan for floor or roof or wall or column or bridge or water-tank (all matters of construction in which we are supposed to be skilled) without making ourselves acquainted with what is to be done is dangerously foolish; and if so, your opinion may have sufficient weight to settle that question. Captious interference we should all deprecate of course, but the engineer or architect must be in command, and must know, not only what is proposed to be done, but how it should be done. We can still leave ample freedom to the experts in the design of the work, in the choice of material and method of carrying out the work.

Materials.

(4) The materials also will no doubt be considered. These are—

- (a) The metal, iron or steel;
- (b) The cement;
- (c) The sand;
- (d) The aggregate, ballast or stone, &c.

For the steel and the cement we shall have the standard specification of the British Engineering Standards Committee, and must inquire if qualities of the standard kinds are suitable for reinforced concrete work.

As to the sand, you know how universally the qualities of good sand are given as clean and sharp. We have to review all that in the light of recent knowledge. In America many experiments have been made which show that cleanliness is not so all-essential as has been supposed, and that washing does not improve every sand. These results were arrived at by experiments on material not only seven days or twenty-one days' old, but were made on pieces of various ages up to three years. Certain work in that way is being done here, and when we have collected and considered the facts our opinion based on knowledge should be of value.

Next as to the sharpness. You may find that sharpness is not so important as variety in size of the grains of sand. Compactness and freedom from voids appear to play a most important part in the strength of mortar, and that freedom from voids may best be obtained by variety of size. These questions we should study with an open mind, free from ancient prejudice.

Then there is the aggregate of stone, gravel, coke-breeze, &c., what proportion to use, what material to use to get the best results in given cases. If we find that washing the sand may be saved, and that concretes of leaner mixture may be used than hitherto with equal safety, we shall have done some good.

Questions arise as to the mixing. We want to know what is the proper way to mix our concrete; how much water to use; whether the sand, gravel, and cement should all be mixed together and the water added, or whether the sand, cement and water should be made first into mortar and the gravel or stone added, as recommended by some. We want to know the value of mixing machines, and whether it is wise to allow a smaller proportion of cement, say 10 per cent. less, if the concrete is mixed by machinery, owing to the fact that it is better mixed. Into all these we must enquire, so as to be able to advise our brother architects and engineers.

Supervision of Work.

(5) Another subject is the carrying out of the work. Should we require that only

skilled men under skilled supervision be employed; that the work be kept wetted, be stopped in frosty weather; how long the centres should be kept up, &c.? All these can only be indicated as matters for your consideration and judgment, and upon which an authoritative pronouncement would be desirable.

Safe Stresses.

(6) One important question which we must consider is what are the safe stresses to allow in various cases. There is apparently no such general agreement upon the safe stresses and methods of calculation as we find in regard to steel or iron, and it is possible that in the present state of knowledge we cannot tell with sufficient accuracy what are the internal conditions in a non-homogeneous beam, to enable us to determine rules which are not open to criticism or improvement with the advance of experience.

Reinforced concrete is, however, being used, and there is need of rules—tentative though they may be—to guide us until we get formulæ which will command general assent. Much has been done in the way of experiment in recent years, so that we are in a much better position to test any of our theories by the results of actual work.

It may be found desirable to refer this part of our subject to a sub-committee of those amongst us who are specially qualified by reason of their mathematical attainments to pronounce upon it.

Our commission is limited to preparing suggestions and recommendations, and therefore any report that may be made will be in the way of advice and not as fixed and immutable rules.

By-laws.

How far our building acts and by-laws should be altered to permit of the use of reinforced concrete walls may also be considered, because as they stand they interfere with the reasonable use of the material.

There is a general feeling that our regulations as to walls should be relaxed in all buildings, at least in rural districts. The agitation for reform in this respect has not yet spread to urban districts, save in regard to the material we are studying; and it certainly seems that if the strength is increased by the use of a metal skeleton the thickness of a concrete wall may be correspondingly reduced.

We fortunately have with us municipal and county engineers and district surveyors whose experience in the working of these by-laws will be of value in restraining too much reforming zeal should we display it.

All the questions thus briefly reviewed are matters upon which the general body of architects and engineers and others interested would no doubt value the consensus of opinion of skilled and disinterested men who have studied the subject. Such an opinion will help the introduction of the material by giving those who hesitate to employ it through want of knowledge and fear of the responsibility, the assurance of the conditions under which it may safely be used, and give that confidence which is at present lacking. It will call attention to its advantages where it has any, such as road bridges over railways, which at present deteriorate rapidly with rust.

Obituary.

Mr. Alexander Shairp, C.E., of Oban, died suddenly last week. He executed considerable architectural work in the town, including the municipal buildings, the parish church, the "Oban Times" buildings, the Argyllshire Gathering Hall, the Memorial Hall, &c. He was engineer for a large part of the Corran Esplanade, and the intricate repairs of the North Pier, under the Town Council, were carried out under his direction.

OUR PLATE.

THE new post-office at Hull is at present in course of construction at the corner of Lowgate and Alfred Gelder Street. It is intended to take the place of the building erected about thirty years ago, which is now quite inadequate to meet the requirements of the post-office. The site was occupied until a short time ago by very old property; a portion of it was originally the site of Suffolk's Palace.

Some difficulty has been experienced with the foundations owing to the nature of the sub-soil on the site, and it has been necessary to enter into a rather unusual method of construction to provide for the heavy superstructure which is to be placed upon the ground. The foundations have consequently been constructed on the Hennebique ferro-concrete system, concrete piles being used and a concrete slab with beams and retaining walls carried upon the piles. This work has been completed by the Yorkshire Hennebique Contracting Co., and the site is now ready for the superstructure.

The perspective view of the building reproduced in this issue shows the elevations to Lowgate and Alfred Gelder Street, which elevations are to be carried out in Portland stone above the plinth; the latter, as well as the balustrade and the main entrance in Lowgate, to be in Peterhead granite.

The public office will be in the centre of the Lowgate front, and access to same will be obtained by two doorways. There will also be a public telephone call office adjoining the public office and accessible from the latter. The remainder of the ground floor is occupied by the rooms for the telegraph messengers and the sorting office for letters and parcels, this latter having an area of 9,000 ft. super.

The first floor will be occupied to a considerable extent by the postmaster and his clerical staff; and there will also be retiring accommodation for the sorting clerks and telegraphists, &c., and a dining-room with kitchen accommodation for the staff generally.

The second floor will accommodate the telegraph and telephone work and batteries. The telegraph instrument room will be 112ft. long by 40ft. wide and the telephone-room 63ft. long by 26ft. wide.

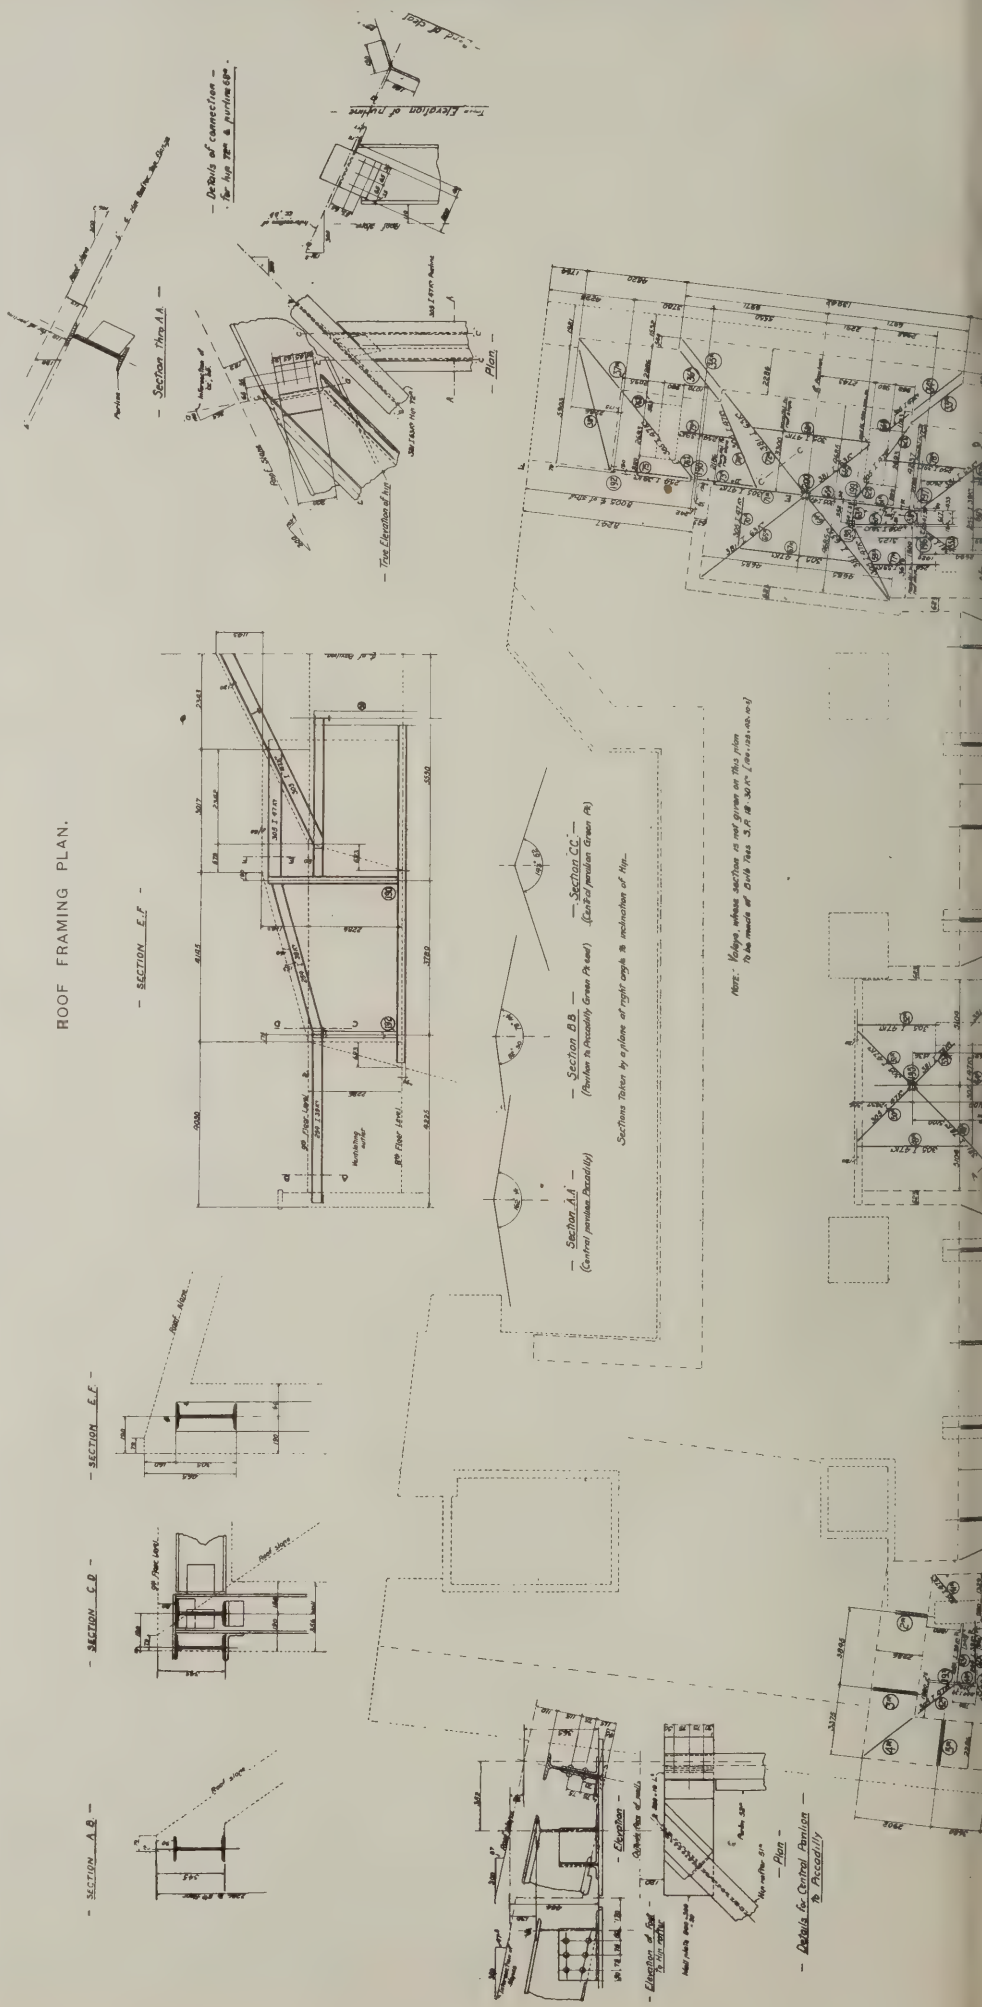

The basement will be largely utilized for the storage of baskets and general stores, including those of the engineers; the postmen will also have a retiring-room on the Alfred Gelder Street side.

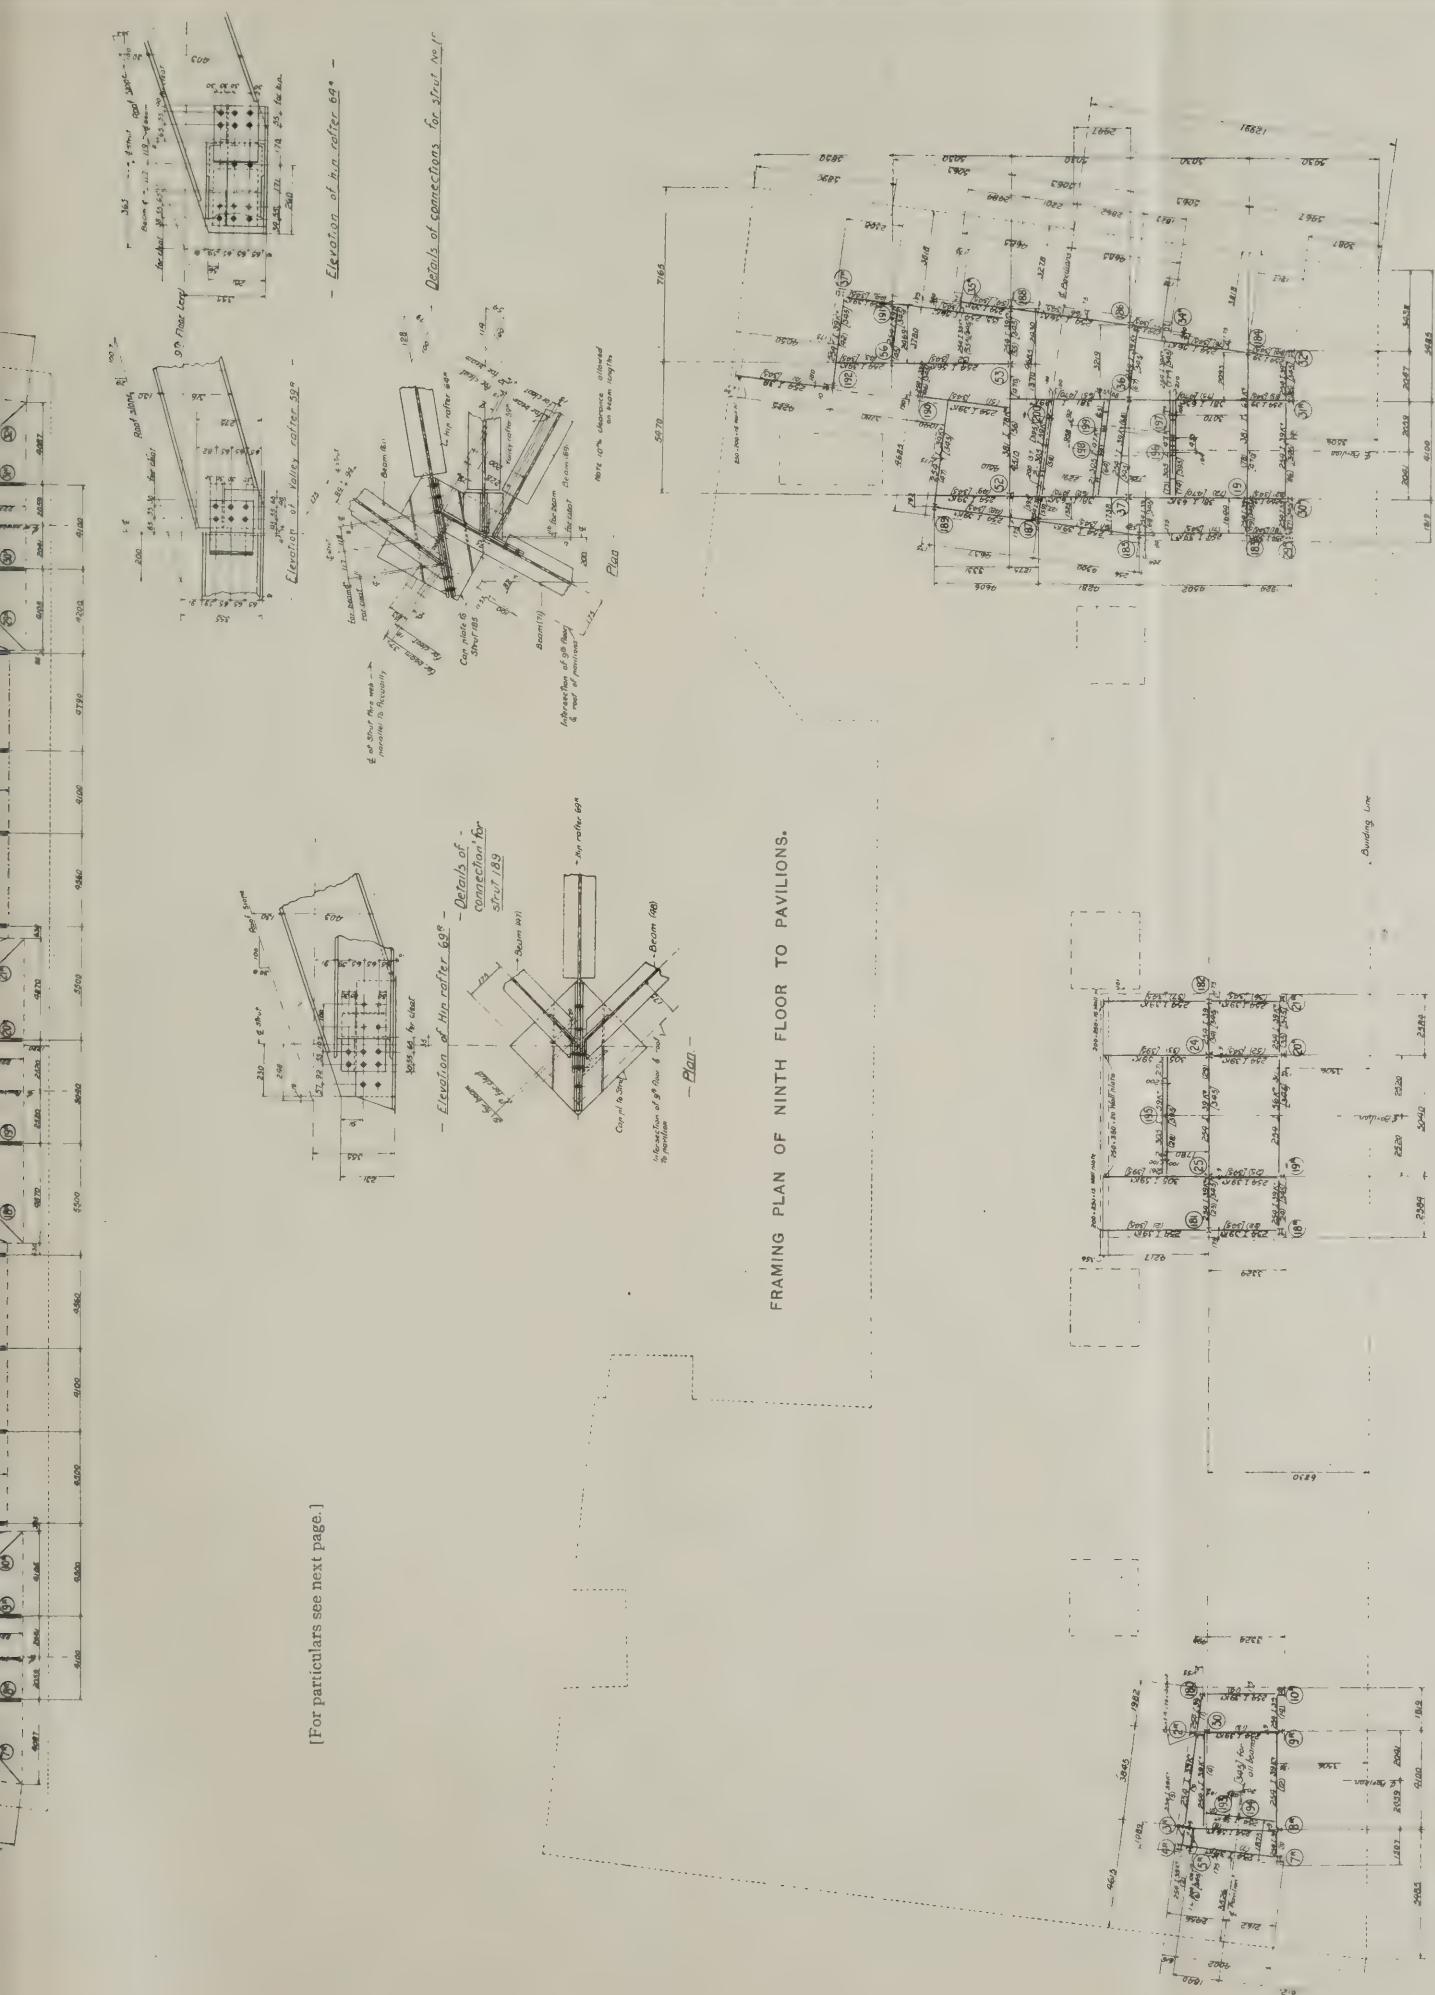

Ample space has been provided in the yard for the loading and unloading of mails and parcels. The entrance to same will be in Alfred Gelder Street.

The sanitary arrangements have been designed upon the latest principles, and the rooms throughout the building will have the walls lined with glazed bricks where occupied by any considerable number of the staff, so as to admit of frequent cleansing.

The building will be heated throughout with low-pressure hot water, and radiators will be provided so that the heat may be regulated. The ventilation of the various rooms has been carefully considered, and provision is being made for the admission of fresh air through the radiators, so that it will be warmed in winter as it enters the building. Lighting will be by electricity.

The contract for the superstructure has been secured by Messrs. Arnold & Son, of Doncaster, and it is anticipated that the building will be ready for occupation about the end of 1908. The total estimated cost, including fittings, is £53,000. The architect is Mr. W. T. Oldrieve, F.S.I., whose design is being carried out under the supervision of Mr. Walter Pott, of H.M. Office of Works.

[For particulars see next page.]

FRAMING PLAN OF NINTH FLOOR TO PAVILIONS.

NOTES ON COMPETITIONS.

Southwark Library.

It is a great relief to know and to be able to announce that after all a fully qualified assessor has been appointed by the Borough Council of Southwark to make a selection from the drawings submitted in the recent competition for a free library. This is a matter for congratulation and regret: congratulation that those who have sent in drawings will have justice meted to them; regret that so many have been debarred from competing through the action of the Competition Reform Society in issuing a notice of disapproval. The Society's action, of course, was rendered imperative by the original intention of the Council to have the drawings judged by a lay committee, assisted by the borough surveyor and an architectural assistant. Extreme measures were not resorted to, however, until after a personal interview between the honorary secretary of the Society and the clerk to the Borough Council, the result of which was, that all hope was abandoned of getting matters placed upon a more satisfactory footing. Nor was confidence restored when the council notified all intending competitors that it would be assisted by a fully qualified architect, for it was but a reasonable precaution to assume, in lack of evidence to the contrary, that the fully qualified architect and the professional member of the council's staff were one and the same person. It does not do to run any risks in these days of competitions that fail, as witness the recent flagrant case of Wallend and the many others that have been the subjects of remark in these columns from time to time. The unwisdom of the "go in and chance it" policy has been amply proved, and the perennial optimism which induces so many to enter the lists, blindly and gaily, under the most unfavorable conditions, is a matter for wonderment. However, all's well that ends well, and at the present stage, as regards Southwark, all's well. No doubt this desirable state of affairs has been largely brought about by the protests which the council has received from numerous sources. The result is encouraging. If concerted action is impossible on the part of would-be competitors, as it evidently is in the present incoherent state of the profession, individual action should at least be taken to induce a successful issue. The Southwark matter is now in the hands of Mr. A. W. S. Cross. There is little doubt he will perform his duties as conscientiously as at Greenwich and with a result as happy.

Acton Municipal Buildings.

It is much to be regretted that an unsuccessful competitor for the Acton Municipal Buildings, who has been conducting a somewhat active campaign against the assessor's award, should, at this the eleventh hour, consider it desirable to lay the matter before the council of the R.I.B.A. Whatever opinions may have been held about the award itself, there are surely but few who would wish to see the successful competitor unseated, now that his appointment has been made and his working plans far advanced. Time did not permit of the matter being discussed at the last meeting of the council, so at present it is in obscurity. To discuss it further here would be to prejudice the case, but it is impossible to refrain from wishing that the council had not been troubled with a matter which can only cause embarrassment.

Birmingham Council House Extension.

The report of Sir Aston Webb and Mr. E. Ingress Bell, the assessors appointed by the Birmingham Corporation in connection with the competition for the Council House extension scheme, was considered last week by the special Sub-committee of the General

Purposes Committee. It was announced that 124 sets of plans had been received in this preliminary competition. Eventually the assessors selected ten designs, the architects of which were found to be Messrs. Crouch, Butler & Savage and Messrs. Mansell, Mansell & Dixon, of Birmingham; Messrs. H. V. Ashley & Winton Newman, Greenaway & Newberry, Henry T. Hare, E. P. Howard, A. N. Prentice, Treadwell & Martin and Wills & Anderson, of London; and Messrs. Matear & Simon, of Liverpool. The preliminary designs are not to be publicly exhibited. The several architects are now preparing for the final competition.

The Peace Palace Competition.

In the competition for Mr. Carnegie's Temple of Peace to be erected at the Hague 217 entries have so far been received. No entry has been refused owing to the time limit having been exceeded. The designs will probably be exhibited in June.

Competitions Open.

The following is a list of competitions open:—

DATE OF DELIVERY.	COMPETITION.
May 5	BRANCH LIBRARY AT SUNDERLAND.—Limited to local architects. Premiums of £20 and £10. Particulars from Mr. John W. Moncur borough engineer, Town Hall, Sunderland.
" 8	ENLARGEMENT OF PARC GWYLLT ASYLUM, near Bridgend. Names to be sent in by this date to Mr. W. E. R. Allen, Glamorgan County Offices, Cardiff.
No date	DETACHED AND SEMI-DETACHED HOUSES AT CLIFTONVILLE, BELFAST.—Premiums £700. Particulars from R. J. McConnell & Co., 51, Royal Avenue, Belfast.
"	SCHOOL AT BEDMINSTER, BRISTOL, for 1,030 children. Limited to Bristol architects. Particulars from W. Avery Adams, secretary to the Bristol Education Committee, Guildhall, Bristol.
"	ALMSHOUSES AT WAREHAM. Particulars from G. C. Filler, North Street, Wareham, Dorset.
"	CHAPEL AND SCHOOLROOM AT MANSELTON, SWANSEA. Particulars from Mr. T. Roberts, 71, Brynhyfryd, Swansea.

R.I.B.A. ANNUAL REPORT.

THE report of the council of the Royal Institute of British Architects for the past year, to be presented to the annual general meeting to be held on Monday next, states that the present membership comprises 749 Fellows, 1,177 Associates, 46 Hon. Associates, 2,507 Probationers and 737 Students. The council announce that the negotiations for the purchase of the freehold garden site in Portland Place for new premises for the Institute have fallen through owing to the impossibility of settling questions of ancient lights in a satisfactory manner. With regard to the new County Hall for London, it is stated that the County Council have been recommended to institute a combined open and invited competition, to be judged by a jury of assessors. The Board of Architectural Education have appointed members to visit the various schools of architecture, and have agreed to grant the certificates issued at Liverpool University, University College and King's College, London, and the Architectural Association Day School. With regard to the Fellowship, which after the end of this year will be closed to all candidates who are not Associates or have passed the examinations qualifying for Associateship, the council express the opinion that it was unjust to the candidates and detrimental to the interests of the Institute that of the twenty-eight candidates nominated for election on March 5th twenty-two non-Associates should have been rejected after the poll demanded by private members. "As most of these non-

elected candidates are, by their age and position, precluded from sitting for an examination, they are thus debarred from membership."

During the past year the following grants have been made by the Council:—Cretan Exploration Fund 25 guineas, Artists' Benevolent Fund 20 guineas, Edinburgh Architectural Association (Architectural Refinements Exhibition) 10 guineas, Architects' Benevolent Society 20 guineas, British School at Athens 20 guineas, Architectural Association £100, Royal Architectural Museum 20 guineas.

For the forthcoming International Congress of Architects, to be held in London in July, the membership up to the present is 672, of whom 188 are ladies. The Executive Committee regard this as a sign that the movement will be largely supported. More than 20,000 circulars have been sent to architects at home and abroad, and the response from foreign countries has been most encouraging. In addition to the grant of £500 mentioned in last year's report, the Council have decided to give an invitation garden party to the Congress at the Royal Botanic Society's Gardens. The Society of Architects has made a donation of £100 to the Congress funds and the Architectural Association 25 guineas.

The financial accounts of the Institute show a considerable reduction of the balance in hand. The reason for this is that £785 was spent in connection with the Institute's opposition to the London Building Acts (Amendment) Bill, 1905, and £319 in connection with the drafting of the Architects' Enrolment Bill.

The Art Standing Committee report, in respect of the new Charing Cross station roof, that Mr. Flockhart had prepared sketch suggestions for the ends of the side walls, which it was considered should be treated in an architectural manner, as also the wind screen. A conference about these suggestions has taken place between Sir Benjamin Baker and Mr. Tempest, on behalf of the Railway Company, and the Art Standing Committee.

The Practice Standing Committee report that they are still considering the revision of the phraseology of the Institute scale of charges, particularly with regard to the ownership of drawings.

The Science Standing Committee report that they have drawn up a short description of the tests to be applied to Portland cement for insertion in specifications where only small quantities are used. The enquiry into the present method of applying Dr. Angus Smith's solution and other preparations for protecting iron has been carried out, and a series of experiments with iron drain pipes treated with different preparations is now being conducted. The committee have reported on the draft specification for structural steel drawn up by the Standards Committee. They have also been represented on the committee dealing with cast-iron pipes for heating and ventilating.

THE RITZ HOTEL.

THE inclusion of the two roof plans in this issue concludes our publication of the steel framing plans of the Ritz Hotel, Piccadilly. We have thus completely recorded the design of the steelwork, because this has been the first large building erected in London on the regular American steel-frame system, so as to afford English architects and engineers the opportunity of carefully studying a type of construction that is new to this country. The ninth-floor framing plan shows the bracing of pavilions at the ninth-floor level. The details show the connections between the roof beams over the pavilions. The other plan shows the framing to roofs, which were constructed on the Columbian system.

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

Supplement to
THE BUILDERS' JOURNAL AND ARCHITECTURAL RECORD,
Wednesday, May 2nd, 1906.

LIBRARY
OF THE
UNIVERSITY OF ILLINOIS

Enquiries Answered.

The querist's name and address must always be given, not necessarily for publication.

Questions should in all cases be addressed to the Editor and be written on one side of the paper only.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Correspondents are particularly requested to be as brief as possible.

Stress on Inclined Beams.

LONDON.—H. C. W. writes: "What are the conditions of the forces at either end of an inclined beam, uniformly loaded, bearing horizontally at supports? Does it act like an ordinary beam, or, if not, where does the change take place?"

An inclined beam has no tendency to slip in consequence of the slope of the major part if the ends have horizontal bearing. It simply acts approximately as an ordinary beam with the same clear span.

HENRY ADAMS.

Upkeep of Cottages.

LONDON.—A. J. T. writes: "A has sixteen leasehold cottages, each let at 8s. 5d. weekly. The conditions in the leases are of the ordinary character. The cottages have not been painted externally as set out in the lease (namely, once in every four years). Without notice the freeholder sends his surveyor to report upon the condition of the property. He makes his survey, and attached to the schedule, which is duly sent to A, is a charge of £2 2s. for solicitors' and surveyor's fees for each tenement, amounting to £33 12s. The solicitors for the freeholder state that they require A to pay £25 per house (£400 in all) as compensation to the freeholder for breach of covenant. The property, being weekly, it will be understood that the cottages are constantly being whitewashed and generally cleansed internally as the occupants leave, so that they may be fit for the new tenants. Last year £64 was spent on this work alone, and the average outlay under this head for the last eight years has been 18 per cent. In the schedule of dilapidations, which is of the usual character, A is called upon to paint both back and front walls of the whole of the cottages, and to paint all wood and ironwork; also to re-instate the front gates to the cottages (these, I may say, have never been in existence). The work has been duly carried out, and the cost amounted to £138. The only item yet to do is the interior cleansing of one of the cottages, the occupier of which refuses to admit the workmen; this cottage was cleansed and painted inside some four years ago. Can the fees of £2 2s. for each cottage and the £25 for the breach of covenant be legally enforced? What is your opinion as to A's liability to erect the iron gates?"

I can hardly imagine that the lease contains no stipulation obliging the lessor to first call upon the lessee to fulfil his obligations thereunder before he takes such action as you describe. Everything, of course, turns upon the actual wording of the lease, and I advise A to consult his solicitor before paying the sum demanded. Subject to the advice he may give A after perusal of the lease, I am of opinion that it is extremely unlikely that A can be called upon to do anything but put the property into repair in accordance with the lease. If he does this, and the matter does not go into court, the surveyor's and solicitors' fees cannot be obtained from him. A cannot, of course, be compelled to repair something which never existed, and therefore the claim for new gates may be ignored. Consult your solicitor at once.

F. S. I.

BENT STAIRCASE GIRDER.

Section for Bent Staircase Girder.

MANCHESTER.—RETLAW writes: "Having a girder of 18ft. span cut, cranked and loaded as shown in sketch, I shall be glad if you will show how I can determine the strength of girder (by diagram) and how I can determine the size of joint plates and the number of rivets required."

The particulars given are shown in Fig. 1, which may be replaced by the frame diagram Fig. 2. For the bending moment under the 2-ton load $5(2 \times \frac{1}{18} + 1'5 \times \frac{1}{18}) = 8'9$ ton-ft., and for the bending moment under the $1\frac{1}{2}$ -ton load $4(1'5 \times \frac{1}{18} + 2 \times \frac{1}{18}) = 6'9$ ton-ft. For the bending moment due to the distributed load of $\frac{1}{2}$ cwt. per lineal foot and the weight of girder say another $\frac{1}{3}$ cwt., making 1 cwt. per ft. run, the actual length being $5 + 10'5 + 4 = 19'5$ ft., the distributed load will be $19'5$ cwt. Then $\frac{WL}{8} = \frac{19'5}{20} \times 18 \div 8 = 2'2$

ton-ft. ordinate at centre of parabola. Putting these down to scale, as in Fig. 3, it is found that the maximum bending moment is 10'7 ton-ft. Then 8 times bending moment = tabular value of load carried by 1ft. run, or $8 \times 10'7 = 85'6$, which would be given by a British Standard Beam (B.S.B. 15) 9in. by 4in. by 21 lbs. if the joist could be left solid, but a joint plate will be required on the bottom flange as well as on the webs, and the rivet holes through the flange will take away some of the strength. It will therefore be necessary to adopt the next size larger, namely, B.S.B. 17, 10in. by 5in. by 30 lbs. The arrangement of joints will be as shown in Figs. 4 and 5.

HENRY ADAMS.

Architects' Fees.

BRISTOL.—J. B. writes: A client instructs an architect to prepare plans for alterations and additions to a house. The architect provides quantities and invites tenders, the lowest of which, amounting to £380, is accepted subject to amended plan and revised tender of £313. The architect charges, through the builder, £18 18s. for the bill of quantities, but in the revised tender increases his charge, through the builder, to £32, to come out of the first certificate. In addition to this the architect charges his client the usual fees for plans, and the client is unaware he has charged anything through the builder for quantities. Is this customary? If not, can the client recover any of the charges?"

For supplying bills of quantities the usual charges are "from a minimum of 1½ per cent. to a maximum of 2½ per cent. according to

the nature of the work, exclusive of lithography and copying." The schedule sanctioned by the Royal Institute of British Architects states that when an architect supplies builders with quantities on which to form tenders he should do so with the concurrence of his employer, and it is desirable, when practicable, that the architect should be paid by him rather than by the builder. It is however often stipulated in the contract that the builder should pay for the quantities. I do not understand the apparently excessive charge named in this case.

F. S. I.

Architect and R.I.B.A. Form of Contract.

MANCHESTER.—SQUARE writes: "When an architect is building for himself would it be right for him to use the R.I.B.A. form of contract, simply inserting his own name both as employer and architect?"

We think not. A special form of contract should be drawn up.

Thickness of Walls and Scantlings of Roofs.

ST. ANNES-ON-THE-SEA.—F. S. writes: "(1) How is the thickness of a wall arrived at under any conditions of loading? (2) How are the scantlings of roof timbers determined over all spans and distances of trusses apart? I have seen a few books giving the sizes of roof timbers, but they place the trusses at roft. apart; would not the trusses require strengthening if they were placed 12ft. 6ins. apart?"

The first question is too vague to be answered. If dwelling-house and warehouse walls are intended, the London Building Act may be taken as a guide. If church walls are referred to, the thickness depends upon their height and the construction of the roof. If retaining walls are meant, the nature of the soil and other circumstances will affect the answer. The scantlings of roof trusses are determined by a combination of calculation and judgment. If a table of scantlings gives the distance apart of the trusses as roft. they would of course be too light for 12ft. 6in. spacing. If d = the given distance apart and D = the proposed distance apart, then the scantlings due to the proposed span s may be made the same as for the span of $s \times \frac{D}{d}$. Example: King-post truss

$s = 24$ ft. span, $D = 12$ ft. 6ins. centres, $d = 10$ ft. centres: then the scantlings adopted may be those given for $s \times \frac{D}{d} = 24 \times \frac{12'5}{10} = 30$ ft. span.

HENRY ADAMS.

NEW LONDON BUILDINGS.

AT yesterday's meeting of the London County Council the Building Act Committee reported the following applications under the London Building Act, 1894, their recommendations as to consent or refusal being appended in *italics* :—

Building on the southern side of Bulwer Street, Wood Lane, Hammersmith, on the application of Macintosh & Newman, on behalf of E. J. Clayton. (*Consent.*)

One-storey shops in front of Nos. 110 and 112, Westbourne Grove, Paddington, on the application of J. A. L. Gimblett. (*Consent.*)

Facia addition to the projecting shelter in front of the Tivoli Music Hall, Strand, on the application of H. Tozer. (*Consent.*)

Bay windows, porches, wooden cornices and sham half-timber work to ten semi-detached houses on the north side of Burbage Road, Dulwich, on the application of W. Griffiths, on behalf of J. Watson. (*Consent.*)

Half-timber work and a projecting porch to a house on the northern side of Liskeard Gardens, Blackheath, on the application of A. M. Torrance, on behalf of N. McDougall. (*Consent.*)

Three external iron gangways, connecting the first, second and third floor levels of Nos. 9 and 10, Lensen Place, Finsbury, an external iron staircase at the eastern end of No. 8, Lensen Place, and two external iron staircases and landings connecting Nos. 8 and 9, Lensen Place, at the first and second floor levels, on the application of L. Tubbs & Welch. (*Consent.*)

Buildings on the site of Nos. 34 to 40 (even numbers), Boleyn Road, Kingsland, on the application of F. J. Staines. (*Consent.*)

Extension of the period within which the erection of buildings on a site on the south side of Kensington Road, Kensington, to abut also upon Palace Gate, was required to have been completed, on the application of Millard & Pryce, on behalf of the Royal Exchange Assurance. (*Consent.*)

Additions in front of Nos. 4, 6, 8 and 10, Loampit Vale, Lewisham, on the application of J. Webster, on behalf of A. E. Woollett. (*Consent.*)

Deviation from the plan approved on 7th November, 1905, for the erection of a projecting flue on the eastern side of the Savoy Hotel extension to project in Savoy Buildings, so far as relates to the erection of an additional flue, on the application of Colcutt & Hamp. (*Consent.*)

Retention of a showcase on the forecourt of No. 449, Holloway Road, on the application of the Holloway Press Co. (*Consent.*)

Covered way in front of No. 160, Knight's Hill Road, Norwood, on the application of Hammond & Son, on behalf of the Colour Type Co., Ltd. (*Refusal.*)

Buildings on the eastern side of Mare Street, Hackney, to abut upon Tudor Road, on the application of Crossman, Prichard & Co., on behalf of J. King. (*Consent.*)

Addition to a factory building on the north-western side of Leipsic Road, Camberwell, on the application of E. J. Strevens, on behalf of Captain Wood. (*Refusal.*)

Buildings on plots Nos. 8, and 9, Goldsmith's Row, Haggerston, to abut upon Goldsmith's Row, Dove Row and Hay Street, on the application of Woodrow & Helsdon, on behalf of D. Dear. (*Consent.*)

Two external iron and concrete balconies at workshop premises on the north-west side of George Street Mews, Holloway, on the application of J. Farrer, on behalf of Foxton Brothers. (*Consent.*)

Wood and Uralite addition to a saw mill, Rotherhithe Street, Rotherhithe, on the application of Burt, Boulton & Haywood, Ltd. (*Consent.*)

Wood and iron buildings of a temporary character at Lower King and Queen Wharf, Rotherhithe Street, Bermondsey, on the application of J. R. Wood & Co., Ltd. (*Consent.*)

Retention of a covered way of a temporary character over a portion of Capel Court, Bartholomew Lane, City, on the application of Joseph & Smithem, on behalf of the Alliance Assurance Co. (*Consent.*)

Extension of the period within which a new street for carriage traffic, to lead from Dartmouth Road to Sydenham Hill Road, Lewisham, was required to be clearly defined throughout by posts and rails or so otherwise as the Council might permit and thrown open to the public as a highway, on the application of Eastman Brothers. (*Consent.*)

Dwelling-house on the eastern side of an extension of Oakford Avenue, Wells Road, Sydenham, approved by the Council on 26th February, 1906, on the application of W. Wilkinson, on behalf of T. Covell. (*Consent.*)

New street for carriage traffic, to lead from Peckham Rye to Dewar Street, Camberwell, on the application of Worsfold & Hayward. (*Consent.*)

New streets for carriage traffic to lead from Manor Park to Manor Lane, Lee, Lewisham, and in connection therewith the widening of a portion of Manor Lane, on the application of G. A. Lansdown, on behalf of W. J. Scudamore & Son. (*Consent.*)

Street for carriage traffic to lead out of the eastern side of West End Lane, Hampstead, on the application of R. J. Worley, on behalf of the Midland Railway Co. (*Refusal.*)

Deviation from the plans approved on 19th December, 1904, in connection with the erection of a building known as Thorney Court, Palace Gate, Kensington, so far as relates to an alteration in the position of the building, on the application of Millard & Pryce. (*Consent.*)

Modification of the provisions of that section with regard to open spaces about buildings so far as relates to the proposed erection of a building on the southern side of Oxford Street, to abut also upon Davies Street, with an irregular space at the rear, on the application of W. A. Lewis, on behalf of Perry Brothers. (*Consent.*)

Modification of the provisions of that section with regard to open spaces about buildings so far as relates to the proposed erection of a building to abut upon Silver Street and Edge Street, Kensington, with an irregular open space at the rear, on the application of W. G. Hunt. (*Refusal.*)

Buildings on the eastern side of Richmond Road, Paddington, on the space at the rear of No. 112, Westbourne Grove, on the application of J. A. L. Gimblett. (*Refusal.*)

Retention of openings uniting Nos. 4 and 6 to No. 8, Lexham Gardens, Earl's Court, on the application of E. L. Wratten, on behalf of the Misses Brown & Charles. (*Consent.*)

Uniting of No. 45, Piccadilly, with a building on the eastern side of Albany Courtyard, on the application of G. D. Martin. (*Consent.*)

Conversion of No. 27, Belvedere Road, Lambeth, into two separate tenements, on the application of P. N. Ginham, on behalf of the Works Committee of the Council. (*Consent.*)

Notes and News.

The new Nautical School at Portishead, of which Mr. Edward Gabriel, F.R.I.B.A., of London, is the architect, is to be opened on Saturday by H.R.H. Princess Christian. The key for the opening has been made by the Bromsgrove Art Guild.

Shakespeare and Old London.—Mr. T. R. Croger, F.R.G.S., F.Z.S., F.P.S., read a paper with this title before last Thursday's meeting of the Society of Architects. He cited a number of the buildings figuring as the scenes of great events in the poet's plays.

"A History of Architecture on the Comparative Method," by the late Prof. Banister Fletcher and Mr. Banister F. Fletcher, is to be translated into Russian by M. Robert Böker, of St. Petersburg, to whom the Russian rights of translation have been sold.

Building Collapse at Lewes.—On Thursday last a spacious timber shed which was being erected at Eastgate Wharf, Lewes, for Messrs. Parsons Brothers, Ltd., about 20ft. high and covering an area of goft. by 30ft., collapsed suddenly, and three men received injuries of a more or less serious nature.

Sheffield Master-Builders and Operatives.—The first meeting of the local conciliation board in connection with the building trade at Sheffield was held last week at the Builders' Exchange. Mr. A. J. Forsdike was appointed chairman of the newly-constituted body, Mr. T. Driver vice-chairman, Mr. J. L. Taffe secretary for the masters, and Mr. H. H. Diver secretary for the operatives.

Special Elections to Fellowship, R.I.B.A.—At the meeting of the council of the Royal Institute of British Architects held on April 23rd the following gentlemen, being presidents of allied societies, were elected Fellows:—Mr. H. S. Chorley (Leeds and Yorkshire), Mr. J. M. Monro (Glasgow Institute), Mr. Harbottle Reed (Devon and Exeter) and Mr. H. H. Thomson (Leicester and Leicester-shire).

The Northern Counties' Building Trades Exhibition was opened at the St. James's Hall, Manchester, on Wednesday last by Alderman Sir James Hoy, Mr. J. H. Woodhouse, president of the Manchester Society of Architects, being in the chair. The exhibition, which remains open until May 5th, contains about fifty exhibits of the usual character, and a small collection of architectural drawings. Among the local firms exhibiting are Messrs. J. & H. Patteson, who have on view a fine display of marble work.

Manchester Society of Architects.—At the annual general meeting of this Society held last Thursday the following officers and members of council were elected:—President, Mr. J. H. Woodhouse; vice-presidents, Mr. J. W. Beaumont and Mr. Edward Hewitt; hon. secretary and treasurer, Mr. Paul Ogden. Council (Fellows): Messrs. John Ely, J. B. Gass, W. C. Hardisty, C. H. Heathcote, J. D. Mould, F. P. Oakley, Isaac Taylor, G. H. Willoughby and P. S. Worthington; (Associates) Messrs. Godfrey Colles, A. E. Corbett and J. H. Gibbons.

Aberdeen Joiners' Dispute.—The trade committee representative of employers and operatives in the Aberdeen joinery trade met last week to consider the proposed alterations in the by-laws as regards overtime, outside men, &c. At one stage there was some hope of an amicable settlement being arrived at, but at the eleventh hour the operatives, failing to agree among themselves, declined to accept the concessions proffered by the representatives of the employers. Reference was made to arbitration, but that was not received with unanimity, and the meeting terminated without any decision being arrived at. A strike is not improbable. The existing by-laws are valid till June 1st.

Complete List of Contracs Open.

WITH a few exceptions, news of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issue of other contracts that still remain open.

Unless expressly stated to the contrary all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair-wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

May 3. Port Talbot.—*Erection of three shops and dwelling-houses* at Station Road. Plans, specifications and conditions of contract to be seen at the office of R. O. Clark, C.E., architect and surveyor, Station Road, Port Talbot, to whom tenders must be sent not later than 4 a.m. on May 3.

May 3. Abererch.—*New schoolroom* attached to Abererch C.M. Chapel, near Pwllheli. Plans, specification &c., are now open for inspection at the Deacon's Room, Chapel House. Tenders, sealed and endorsed "Tender for Schoolroom," to be delivered to R. Parry, Penbrynaudd, Abererch, not later than 4 p.m. on May 3.

May 3. Edinburgh.—*Alterations at public library, &c.*, in town house, Portobello, according to plan and specification, which may be seen at the Public Works Office, or at the office of Mr. Baxendale, registrar, Town House, Portobello, where copies of the specification may be had on deposit of £1 rs. by crossed cheque. The estimates must be sealed and marked "Tender, Portobello Library," &c., and sent to R. Morham, city architect, Public Works Office, City Chambers, Edinburgh, not later than May 3.

May 3. Glasgow.—*Works to be executed in the construction of a potato shed and warehouse on the site of the old City Poor-house to the east of Buchanan Street Goods Station, and of a portion of a bridge to carry Dobbie's Loan for the Caledonian Railway Co.* Drawings may be seen at the office of the Company's Engineer, Buchanan Street Station, Glasgow, where copies of the specification and schedule may be obtained on payment of £2 2s. Sealed tenders, endorsed "Tender for Buchanan Street Station Potato Shed Warehouse and Relative Works," to be lodged with J. Blackburn, secy., Caledonian Railway Co.'s Offices, 302, Buchanan Street, Glasgow, by May 3.

May 3. Sunderland.—*Erection of caretaker's house in connection with Harrison Buildings, in Silver Street.* Drawings and conditions of contract may be seen, and specification, schedule of quantities and form of tender obtained at the Borough Surveyor's Office, Town Hall. Sealed tenders, addressed "To the Chairman of the Health Committee," and endorsed "Tender for Caretaker's House, Harrison Buildings," must be delivered at the Town Clerk's Office, Town Hall, before noon on May 3.

May 3. Hastings.—*Repairs to two cottage homes, 100, Ashburnham Road and 59, Vicarage Road.* A copy of the specification of the work may be obtained on application at the Union Offices, 11, Wellington Square, Hastings. Tenders to be sent in to Arthur R. Inskipp, clerk, 11, Wellington Square, Hastings, not later than noon on May 3.

May 4. Norwich.—*Enlargement of Shelton and Hardwick School, for the Norfolk Education Committee.* Builders desirous of tendering should send in their names to A. F. Scott, architect, Castle Meadow, Norwich, at whose offices plans and specification can be inspected and bills of quantities obtained. A deposit of £1 rs. will be required. Tenders must be delivered by noon on May 4, addressed to "The Secretary, Norfolk Education Committee, 57, London Street, Norwich," and endorsed "Tender for Shelton and Hardwick School."

May 4. West Somerton.—*Enlargement of the School.* Builders desirous of tendering should send in their names to the Secretary, Norfolk Education Committee, 57, London Street, Norwich, at which office plans and specification can be inspected and bills of quantities obtained. Tenders must be delivered by 12 noon on May 4, addressed to "The Secretary," at the above address, and endorsed "Tender for West Somerton School."

May 4. Swansea.—*Erection of grand stand and ring on the occasion of the Horse Show.* Particulars may be obtained of the secretary, F. J. Parker, Plymouth Street. Tenders to be sealed and marked "Tender for Stand," and forwarded to the Secretary on or before May 4.

May 5. Arnside.—*Erection of a new house and alterations to No. 1, Beechmount, Arnside, for J. Airey.* Applications for quantities to be sent to R. Morton Rigg, architect and surveyor, Arnside, by May 5.

May 5. Burwardesley.—*Alterations and additions to the school buildings.* Plans and specifications can be seen at the office of H. Beswick, county architect, Newgate Street, Chester, and quantities obtained, on deposit of £1. Tenders, endorsed "Tender for Works at Burwardesley," to be sent to H. Grant Bailey, clerk, Crypt Chambers, Chester, on or before May 5.

May 5. Chelmsford.—*Erection of a pair of villas in Park Avenue.* Plans, specification and form of contract can be seen at the office of F. Whitmore, architect, 73, Duke Street, Chelmsford, to whom tenders, endorsed "Tenders for Villas, Park Avenue," must be delivered by May 5.

May 5. Ynysddu.—*Erection of four houses at Ynysddu, for W. H. Stone, Black Prince Hotel, Ynysddu, Mon.* Plans and specification can be seen at the above hotel. Tenders, sealed and endorsed, to be delivered to Mr. Stone, at the above address, not later than noon on May 5.

May 7. Cwmparc.—*Enlargement of Parc C.M. Chapel, Cwmparc, together with new assembly hall and classrooms.* Tenders to be delivered to Thomas Morgan,

Ardwyn, Cwmparc, on or before May 7, sealed and endorsed "Tender," with whom also plans and specifications may be seen, or at the office of R. S. Griffiths, M.S.A., architect and surveyor, Excelsior Buildings, Tonypandy.

May 7. Ashby.—*Erection of a new Wesleyan church at Ashby, Lincolnshire (near Frodingham).* Plans and specifications may be seen at the office of W. H. Buttrick, architect, 28, Wells Street, Scunthorpe, to whom tenders are to be sent not later than noon on May 7, sealed and endorsed "Tender for Ashby Wesleyan Church." Particulars may be had on receipt of a deposit of £2.

May 7. Crossgar.—*Erection of a dispensary and dispensary residence for the use of the medical officer of the Crossgar Dispensary District, in the townland of Crossgar, convenient to the village of Dromara, according to the plans and specifications prepared by W. W. Larmor, architect, and now deposited at Pcor Law Office, Workhouse, Banbridge, for inspection.* The Guardians desire that the materials used in the above works shall be as far as possible of Irish manufacture. The contractor must undertake to have the whole of the works completed on or before the October 31, 1906. Sealed tenders, addressed "To the Presiding Chairman," on the special form obtainable from this office, and containing the names and addresses of two solvent sureties willing to join with contractor in a joint and several bond for double the amount of the contract, will be received at the Poor Law Office, Workhouse, Banbridge, up to noon on May 7.

May 7. Lumphanan.—*Mason, carpenter, plumber, slater, painter and glazier works of a cottage to be erected near Lumphanan Station.* Plans and specification may be seen with Andrew Fraser, Rosedale Cottage, Lumphanan. Tenders will be received by Isaac Muirton, Corse, Lumphanan, up to and including May 7.

May 7. Southampton.—*Alterations and additions to warehouse "G," to convert the same into an ice store, for the Harbour Board.* Drawings, specifications and conditions may be seen upon application at the Harbour Board Office to E. Cooper Poole, A.M.I.C.E., engineer to the Board, and bills of quantities and form of tender obtained upon payment of £1. Sealed tenders, endorsed "Alteration to Warehouse 'G,'" to be delivered at the office of J. E. Pailthorpe, clerk to the Board, Harbour Board Offices, Town Quay, Southampton, not later than noon on May 7.

May 8. Hampton.—*Erection of porter's lodge at the Isolation Hospital, Uxbridge Road, Hampton Hill; five-stall public convenience at High Street, Hampton Hill; five-stall public convenience at Bell Hill, Hampton.* The drawings and specifications may be seen and forms of tender obtained of the Surveyor, upon application being made, accompanied by a deposit of £2. Fair wages clause. Sealed tenders, endorsed "Tender for Lodge, &c.," to be delivered to the clerk to the Council not later than 4 p.m. on May 8.

May 8. Maenclochog.—*Repairs and alterations to the Council school.* Drawings and specifications may be seen on application to the headmaster at the school, and also at the offices of the architect, D. E. Thomas, 17, Victoria Place, Haverfordwest. Tenders must be endorsed "Tender for Maenclochog Council School," and delivered to W. Davies George, clerk to the Education Committee, County Education Offices, 9, Quay Street, Haverfordwest, on or before May 8.

May 8. Nuneaton.—*Erection of a small-pox hospital at Bramcote, near Nuneaton.* Drawings and specification may be seen at the office of F. C. Cook, surveyor to the Council, Nuneaton, and bills of quantities obtained from him on deposit of the sum of £5 5s. Sealed tenders, endorsed "Tender for Small-pox Hospital," must be sent to F. S. Clay, clerk to the Joint Hospital Committee, Bridge Street, Nuneaton, by noon on May 8.

May 8. Alford.—*Erection and completion of a house, for the U.D.C., on the Council's property in Alford according to the plans and specification to be seen at the office of J. E. H. Sergeant, clerk of the Council, Alford to whom tenders are to be sent by noon on May 8.*

May 9. Glasgow.—*Excavations and masonry work, also cast-iron pillars and steel beams, wright-work, slater-work, plumberwork, plasterwork, and tile work in connection with buildings proposed to be erected in Hope Street.* Specifications and forms of offer may be had on application at the Office of Public Works, City Chambers, 64, Cochrane Street. Sealed offers, marked outside "Offer for Hope Street Improvement," must be lodged with A. W. Myles, town clerk, City Chambers, Glasgow, not later than 10 a.m. on May 9.

May 9. Shotley Bridge.—*Brickwork, slating, &c., required in the extension of the resort house at the Shotley Bridge Gasworks.* Plans and specifications may be seen at the Gas Office, Shotley Bridge, and the site viewed at the Works. Tenders to be sent to M. Richey, secy., Gas Office, Shotley Bridge, not later than May 9.

May 10. Royton.—*New public elementary school at Byron Street, Royton, near Oldham.* The plans may be seen and bills of quantities obtained at the office of the county architect, Henry Littler, 16, Ribblesdale Place, Preston, by payment of a deposit of £2. Tenders must be delivered before noon on May 10, sealed and endorsed, to J. W. Riley, Town Hall, Royton.

May 10. Newby.—*Enlargement of Newby Chapel.* Plans and specifications may be seen at Townhead, Newby, and estimates, sealed and endorsed, to be returned to Richard Green, Newby, by May 10.

May 11. Abernant.—*Rebuilding Bethesda Welsh Independent Chapel, Abernant, Aberdare, for the Trustees.* Plans and specification can be seen at the office of T. Roderick, architect, Ashbrook House, Clifton Street, Aberdare. Endorsed tenders to be sent to J. Barclay, 10, Windsor Terrace, Abernant, not later than May 11.

May 11. Taunton.—*Erection of a new classroom wing and corridors, and also a new corridor to connect this extension with the new chapel, at Taunton school.* The plans and specifications may be seen and bills of quantities obtained at the offices of F. W. Roberts, M.S.A., architect and surveyor, 2, Hammet Street, Taunton, to whom tenders must be delivered by the first post on May 11.

May 12. Redruth.—*Erection of banking premises at Penryn Street, Redruth, and shop premises adjoining same, for Barclay & Co. Ltd.* The drawings and specifications may be seen by appointment at the offices of the architect, C. Caldwell, Victoria Square, Penzance, to whom sealed tenders, endorsed "Tender for Banks," are to be sent by May 12.

May 14. Alford.—*Building a church hall at Alford, Lincolnshire.* Plans and specifications may be seen at Mr. Green's, chemist, Market Place, Alford, by appointment. Tenders must be received on or before May 14.

May 14. Marlpool.—*Council school to accommodate about 216 boys.* Persons desirous of tendering for the work may see the drawings, specification, agreement, &c., at the office of the Architect to the Committee, St. Mary's Gate, Derby, between 10 a.m. and 4 p.m., except on Saturday, when they will be on view from 10 a.m. to 12 noon. A copy of the bill of quantities, specification, conditions of contract and form of tender can be obtained at the Architect's Office upon payment of £1 rs. Sealed tenders, in envelopes provided for the purpose, endorsed "Tender for New Council School, Marlpool," must be delivered to George H. Widdows, A.R.I.B.A., architect to the Committee, County Education Offices, St. Mary's Gate, Derby, not later than 5 p.m. on May 14.

May 15. Sheffield.—*Erection of tenements on section 2 of the Crofts area.* Tenders for work required in connection with the above:—Excavator, bricklayer and mason, carpenter and joiner, slater, plasterer, plumber and glazier and painter. Specifications and plans may be seen and quantities obtained at the office of Charles F. Wike, C.E., city surveyor, Town Hall, Sheffield, on payment of £1 rs. Tenders, endorsed "Crofts Dwellings," are to be sent in not later than 9 a.m. on May 15, addressed to "The Chairman and Members of the Health Committee, City Surveyor's Office, Town Hall, Sheffield." Fair wages clause.

May 15. Patterdale.—*Alterations to St. Patrick's Church, Patterdale.* Plans, specifications and all particulars may be obtained on application to George Wason & Son, architects, St. Andrew's Chambers, Penrith. Tenders to be sent to the Rev. W. P. Morris, the Rectory, Patterdale, not later than May 15, endorsed "Tender for Church."

May 16. Epping.—*Construction of nurses' and infants' quarters at the Epping Workhouse.* Drawings can be seen and further particulars and bills of quantities obtained at the office of H. Tooley, A.R., A.B.A., Buckhurst Hill, upon a deposit of £1 rs. Applications for quantities must be made to H. Tooley before May 4. Tenders to be made on forms which will be supplied, and to be sent in the envelopes which will be provided, to R. D. Trotter, clerk to the Guardians, Epping, on or before 5 p.m. on May 16.

May 16. Uttoxeter.—*New Council school to accommodate about 532 children.* Builders desiring to tender for the work should apply to Graham Balfour, Director of Education, Stafford. Quantities will be supplied, for which a deposit of £1 rs. will be charged. The drawings and specification can be seen at the office of the Education Committee at Stafford.

May 16. Aberdeen.—*Mason, carpenter, glazier, slater, plumber, plaster, heating and iron works of alterations and additions at the north-east portion of the main buildings of the Royal Asylum.* The plans and conditions of contract may be seen with, and specifications and schedules of quantities obtained from, Kelly & Nicol, architects, 367, Union Street, Aberdeen. Sealed tenders are to be lodged with A. Scott Finnie, clerk and treasurer, 343, Union Street, Aberdeen, not later than May 16.

May 17. Walmersley-cum-Shuttleworth.—*Enlargement and improvement of the Turn-i-th-Lane Council School, Walmersley-cum-Shuttleworth.* The plans may be seen at the Council Offices, Ramsbottom, and bills of quantities obtained at the offices of the county architect, Henry Littler, 16, Ribblesdale Place, Preston, by payment of a deposit of £1. Tenders must be delivered before noon on May 17, sealed and endorsed, to W. Dilworth, Arden House, Summerseat, near Manchester.

May 18. Dundee.—*New school in the east end of the city, for the School Board.* Plans may be seen and schedules of quantities obtained on application to J. H. Langlands, architect of the Board, 31, Murraygate, Dundee. Offers must be sealed and marked "Tenders for New School," and lodged with John E. Williams, clerk, School Board Offices, Dundee, not later than noon on May 18.

Tenders.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, Great New Street, Fetter Lane, E.C. Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

Aberdeen.—Accepted for the erection of a new public school at Kuthrieston, for the School Board. Mr. J. A. O. Allan, architect. Quantities by Mr. R. Addie, 129, Union Street.

Excavator—J. Gould.
Mason—E. Gould.
Carpenter—Hendry & Keith.
Slater—Merson & Stewart.
Plasterer—Sellar & Co.
Plumber—J. J. Johnston.
Painter and glazier—J. Mason & Son.
Blacksmith—G. Thomson.
Electric lighting—Pratt & Keith.

[Total, £14,319 16s.] [All of Aberdeen.]

Beauworth.—For the erection of a school, &c., at Beauworth, about six miles from Alresford Station on the London and South-Western Railway, for the Wiltshire County Council. Mr. W. J. Taylor, county surveyor, Winchester:—

C. Wright, Lee-on-the-Solent ... £2,021 15 1
Parnell & Son, Rugby ... 1,971 0 0
Crosby & Co., Farnham ... 1,969 0 0
Jenkins & Sons, Southampton ... 1,868 0 0
F. J. Eddolls, Alresford ... 1,823 1 6
Hale Brothers, Bishop's Waltham ... 1,717 0 0
Grace & Sons, Clatford, Andover ... 1,708 16 6
Annett & Sons, Andover ... 1,545 0 0

* Accepted.

Cefn Mawr.—For the erection of a new Baptist chapel in Cefn Street, for the English Baptist Mission (Mr. G. R. Morris, secretary). Mr. G. Martin Tune, architect and surveyor, Pontycysylltau, Llangollen:—

J. Carden, Rhosymedre ... £1,695
W. F. Humphreys, Cefn ... 1,210
J. T. Jones, Cefn ... 1,195

* Recommended for acceptance.

Cosby.—For works of repair, new vestry, &c., to Cosby church, seven miles from Leicester. Mr. H. Cayley, architect, Bank Chambers, Rothwell, Kettering:—

W. J. Bloxham, Banbury ... £1,599 0 0
R. Cosford, Northampton ... 1,580 0 0
H. Smith, Wolverley, Kidderminster ... 1,297 0 0
S. F. Halliday, Stamford ... 1,248 15 0
W. Lord, Narborough ... 1,215 10 0
G. Henson & Sons, Wellingborough ... 1,177 0 0
T. E. Banbury, Leicester ... 1,115 17 0
Bowman & Sons, Stamford ... 1,100 0 0
Heighton & Co., Cosby ... 1,093 15 0
W. Moss & Sons, Narborough ... 1,090 10 0
T. Herbert (late Cockram), Leicester ... 1,076 9 6
F. J. Bradford, Leicester ... 1,073 4 0
J. R. Cooke, Broughton Astley, Rugby ... 1,059 7 0
Scurr, Jowitt & Co., Barrow-on-Soar, Loughborough ... 1,035 10 0
J. & A. Agar, Syston, Leicester ... 1,016 0 0

* Accepted.

Eastney.—For the erection of St. Patrick's church hall and mission buildings in Eastfield Road. Mr. G. E. Smith, architect, Glendore, 145, Victoria Road North, Southsea:—

Wright & Hurst ... £2,987 0 0
McCarthy Brothers ... 2,962 0 0
W. Beaton ... 2,935 16 6
T. Pearce ... 2,929 0 0
S. Salter ... 2,759 0 0
J. Wright ... 2,698 4 10
M. K. Coltherup ... 2,695 0 0
T. W. Quick ... 2,689 0 0
J. Croad ... 2,650 0 0
J. Harding ... 2,642 0 0
G. H. Rowdell ... 2,600 0 0
E. & A. Spriggins ... 2,600 0 0
J. Crockerell, Victoria Road North, Southsea ... 2,556 0 0
H. Clark & Sons ... 2,549 0 0
W. W. Learmouth ... 2,500 0 0
H. Jones ... 2,440 0 0
H. H. Hall ... 2,374 0 0

* Accepted.

Gainsborough.—For the erection of an elementary school in Koper Road, for the Lindsey County Council Education Committee. Messrs. Scorer & Gamble, architects, Bank Street Chambers, Lincoln:—

H. Peake, Peterborough ... £8,125 0 0
Bowman & Sons, Stamford ... 7,497 10 0
E. Good & Sons, Hull ... 7,390 0 0
Halkes Brothers, Lincoln ... 7,378 0 0
B. Crooks, Woodhall Spa ... 7,260 0 0
F. Messom, Nottingham ... 7,126 13 6
J. Cooper & Sons, Nottingham ... 7,060 0 0
G. Longden & Son, Sheffield ... 6,990 0 0
W. Barton, Thorne, Doncaster ... 6,960 0 0
H. S. & W. Close, Lincoln ... 6,908 10 0
T. Cuthbert, Nottingham ... 6,745 0 0
C. Wright, Leicester ... 6,649 0 0
F. T. Salmon & Co., Cudworth ... 6,598 4 4
F. Scarborough, Lincoln ... 6,530 0 0
A. J. Elmes, Gainsborough ... 6,207 13 9
Sprakes & Sons, Doncaster ... 6,175 0 0
Moss & Sons, Loughborough ... 5,900 0 0

* Accepted.

Hereford.—For the erection of a pair of semi-detached villas on the Highfield Building Estate. Messrs. Groome & Bettington, architects and surveyors, Palace Chambers, King Street, Hereford:—

E. J. Davies ... £925 0 0
R. L. Friend ... 907 10 0
Davies & Co. ... 876 0 0
W. Powell ... 836 0 0
C. Cooke ... 810 0 0
J. T. Jones ... 770 0 0

* Accepted. [All of Hereford.]

Kingston-on-Thames.—Accepted for the erection of new elementary schools in Richmond Road, for the Town Council:—

F. G. Lawrence ... £10,237
[Thirty-six tenders received.]

London, S.W.—For the erection of a new wing to the Waste Land and Lygon Almshouses, Fulham Palace Road, Fulham, S.W., for the Trustees of the Fulham Waste Land and Lygon Almshouses Charity. Mr. Ernest Avern, architect, 13, Tyrerway Road, Fulham. Quantities by Mr. T. Woodbridge Biggs, 10, Clifford's Inn, E.C.:—

H. Haynes, Wembley ... £1,785 0 0
F. J. Lovell & Son, Marlow ... 1,680 0 0
F. G. Minter, Putney ... 1,641 0 0
Patman & Fotheringham, London ... 1,563 0 0
H. Terry, Fulham ... 1,560 0 0
W. Johnson & Co., Wandsworth Common ... 1,539 0 0
E. Swan & Son, Fulham ... 1,520 0 0
W. Lawrence & Son, Walthamstow ... 1,494 0 0
J. Barker & Co., London, W. ... 1,457 0 0
E. J. Clayton, London, W. ... 1,453 0 0
B. E. Nightingale, Lambeth ... 1,415 0 0
Cowley & Drake, Willesden Green ... 1,387 0 0
A. Brickell, West Kensington ... 1,358 0 0
F. G. Lawrence, Kingston-on-Thames ... 1,332 19 4
C. Gray, Shepherd's Bush ... 1,300 0 0
F. & G. Foster, Clifford Road, Norwood Junction ... 1,296 0 0

* Recommended for acceptance.

London.—For the supply of locks required at Long Grove Asylum:—

Chubb & Sons, Ltd., London ... £3,075 0 0
J. Gibbons, Wolverhampton ... 1,993 13 4
Hobbs, Hart & Co., London ... 1,868 12 6
C. G. Smith & Co., London ... 1,546 12 6

London.—For the installation of electric lighting and power (excluding generating plant) at Long Grove Asylum, for the London County Council:—

E. D. Triswell ... £25,117 0 0
W. Mackie & Co. ... 19,127 0 0
Edmundson's Electricity Corporation, Ltd. ... 17,048 0 0
New alternative tender ... 16,550 0 0
W. Dibbed, Southampton ... 17,027 1 0
G. Hartland, Bowden & Co., Manchester ... 16,814 0 0
J. O. Grant & Taylor ... 16,586 0 0
Tyler & Freeman ... 16,542 0 0
F. A. Glover & Co., Ltd. ... 16,500 0 0
W. H. Arundell, Maidenhead ... 16,300 0 0
W. G. Heath & Co., Plymouth ... 16,000 0 0
Strode & Co. ... 15,973 0 0
T. Hiscock Hounslow ... 15,935 13 6
Bailey, Grundy & Barrett, Cambridge ... 15,750 10 0
Strange & Son, Ltd., Tonbridge ... 15,654 0 0
G. N. Haden & Son, Tonbridge ... 15,427 0 0
Hooper, Neary & Co. ... 14,976 0 0
Dargue, Griffiths & Co., Liverpool ... 14,448 0 0
S. S. Cozens ... 14,217 0 0
J. E. Spagnoletti & Co. ... 14,000 0 0
H. A. Jackson & Co., Blackburn ... 13,995 0 0
Tamplin & Makovski, Redhill ... 13,883 0 0
Buchanan & Curwen ... 13,880 0 0
Sweet Brothers ... 13,855 9 7

The Army and Navy Auxiliary Stores ... 12,880 0 0
W. Fryer & Co. ... 12,769 0 0
W. J. Furze, Nottingham ... 12,700 0 0
W. Winn ... 12,675 0 0
Cox Walkers, Durlington ... 12,582 0 0
Besvan & Sons, Ltd. ... 12,495 0 0
R. Cort & Sons, Ltd. ... 12,336 0 0
Jackson Brothers ... 12,235 0 0
Bromley, Batstone & Kirk ... 11,600 0 0
Lea & Warren, London and Kettering ... 11,200 0 0

* Accepted. [Rest of London.]

Morley.—Accepted for the erection of a cotton-spinning mill, for the Morley Cotton Spinning Co. Messrs. T. A. Buttery & S. B. Birds, architects, Queen Street, Morley:—

Mason—J. Clegg & Son, Morley ... £5,390 0 0
Ironfounder—Newsome & Askham, Batley ... 2,722 0 0
Plasterer and Concretor—Bagnall Brothers, Wakefield ... 1,178 19 11
Joiner—Smith & Bland, Leeds ... 1,335 13 4
Plumber—G. A. Firth, Morley ... 194 0 0
Slater—G. Rogerson, Morley ... 24 5 0

Morley.—Accepted for the erection of a new woollen mill, for Mr. J. W. Appleyard. Messrs. T. A. Buttery & S. B. Birds, architects, Queen Street, Morley:—

Joiner—P. Rhodes, Leeds ... £2,100 0 0
Mason—I. Newton, Morley ... 1,190 0 0
Ironfounder—Morley Engineering and Pulley Co., Morley ... 315 14 0
Slater—J. Atkinson & Son, Leeds ... 229 18 6
Plumber—G. A. Firth, Morley ... 204 0 0
Plasterer—J. Iredale & Son, Birstall ... 56 13 8

Newport.—Accepted for the erection of the new Carnegie free library, Corporation Road, for the Corporation:—

J. H. Williams, Llanwrn, near Newport ... £2,000
Seascale (Cumberland).—For the erection of a residence for Mr. George R. Burnett. Mr. W. L. Mason, F.R.I.B.A., architect, Ambleside:—

D. Mackereth, Milson ... £2,739 0 0
H. Eillbeck & Son, Seascale ... 2,618 0 0
G. W. Bradley, Milson, Cumberland ... 2,597 0 0
J. Fyson, Gosforth, Cumberland ... 2,417 13 2
W. Gradwell & Co., Barrow-in-Furness ... 2,414 0 0
L. Ferguson, Willow Dene, Harrington ... 2,389 0 0
J. Laing & Son, Widdowburn Street, Carlisle ... 2,359 0 0

* Accepted.

Tamworth.—For certain new buildings and alterations to their premises in Orchard Street, The Leys, Tamworth, including the erection of butcher's and grocer's shops and sundry other works, for the Tamworth Industrial Co-operative Society. Mr. Francis B. Andrews, architect, 95, Colmore Row, Birmingham:—

W. Bishop, King's Heath, Birmingham ... £5,185 0 0
E. Williams ... 5,113 0 0
J. Smith & Sons, Birmingham ... 5,078 0 0
C. E. Shuttleworth, Tamworth ... 5,022 10 0
J. Barnsley & Son, Birmingham ... 5,002 0 0
H. Smith, Wolverley, Kidderminster ... 4,936 0 0
T. Elvins, Birmingham ... 4,895 0 0
Watson & Sons ... 4,880 0 0
W. Robinson, Birmingham ... 4,766 0 0
C. Clarkson & Sons* ... 4,718 0 0
B. Musson ... 4,677 0 0
Co-operative Builders, Kettering ... 4,271 0 0

[Rest of Tamworth.] * Accepted.

Thornley.—For the erection of a small-pox hospital near Thornley, co. Durham, for the Easington and Sedgfield Joint Smallpox Hospital Board. Mr. James Stones, architect and surveyor, Sedgfield:—

Sanderson & Bell, Coxhoe, co. Durham ... £3,553 13 0
T. Manners, Bishop Auckland ... 3,295 0 0
A. Metcalfe, Shildon ... 3,054 14 0
G. W. Lazenby, Ferryhill ... 2,835 0 0
S. & G. Colwill, Wingate ... 2,830 0 0
Makepeace & Vaux, Trimdon, co. Durham ... 2,550 0 0

* Accepted.

Wimbledon.—For slipper baths extension, for the Town Council. Mr. C. H. Cooper, surveyor:—

Parsons & Townsend ... £2,007 0 0
J. Barrett ... 1,913 0 0
G. Beloni ... 1,883 0 0
H. E. H. Buckingham, Ltd. ... 1,844 0 0
J. Burges & Sons ... 1,800 0 0
E. P. Bulled ... 1,773 9 5
F. & G. Foster ... 1,769 0 0
J. Garrett & Son ... 1,767 0 0
W. S. Sheppard ... 1,754 0 0
Martin, Wells & Co. ... 1,750 0 0
B. E. Nightingale ... 1,733 0 0
R. Dean & Co. ... 1,705 10 0
W. H. Hyde ... 1,685 0 0
F. G. Laurence, Kingston ... 1,540 1 8

* Accepted.

Wimbledon.—For external cleaning and painting, &c., at the Library buildings, for the Library Committee:—

R. H. Adams ... £93 15 0
Parsons & Townsend ... £70 0 0
H. E. H. Buckingham, Ltd. ... 60 10 0
J. Thursting ... 55 0 0

* Accepted. [All of Wimbledon.]

Wimbledon.—For the erection of ten villas at Chatsworth Avenue, for the Polytechnic Estate, Ltd. Mr. William C. Poole, architect, Wandsworth Common:—

Harbour & English, Southend-on-Sea ... £3,120
H. E. H. Buckingham, Ltd., Wimbledon ... 3,050
Hall & Jacobs, Sydenham ... 2,938
Workington.—For the whole or any of the trades required in altering and extending the Central Hotel, Workington for the Workington Brewery Co. Messrs. Oliver & Dodgshun, F.F.R.I.B.A., architects, Carlisle:—

T. Mackenzie, Maryport ... £3,757 14 4
H. Kilip, Harrington ... 3,179 9 0
T. Johnston, Workington ... 2,924 18 6
J. Shackley, Harrington ... 2,808 17 0
B. Hyde, Workington ... 2,707 18 3

* Accepted.

Coming Events.

Wednesday, May 2.

ROYAL ARCHAEOLOGICAL SOCIETY.—"Notes on Fonts," by Mr. Alfred Fryer, and "Excavations in Hayling Island," by Mr. Talfourd Ely, at 4 p.m.

INSTITUTION OF CIVIL ENGINEERS.—Mr. R. D. Hadfield on "Unsolved Problems in Metallurgy," at 8 p.m.

BUILDERS' FOREMEN AND CLERKS OF WORKS' INSTITUTION.—Ordinary Meeting at 8 p.m.

Thursday, May 3.

CHEMICAL SOCIETY.—Ordinary Meeting at 8.30 p.m.

WORSHIPFUL COMPANY OF CARPENTERS.—Mr. J. Bartlett on "Shoring, Timber Framing and Floors," at 7.30 p.m.

Saturday, May 5.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Visit to Newbattle Abbey, Dalkeith, N.B.

Monday, May 7.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.—Annual General Meeting at 8 p.m.

SURVEYORS' INSTITUTION.—Junior Meeting at 7 p.m.

SOCIETY OF ENGINEERS.—Mr. David Sommerville on "The Chemistry and Bacteriology of Potable Waters," at 7.30 p.m.

Thursday, May 10.

WORSHIPFUL COMPANY OF CARPENTERS.—Mr. J. Bartlett on "Shoring, Timber Framing and Floors," (continued), at 7.30 p.m.

Friday, May 11.

ARCHITECTURAL ASSOCIATION.—First Summer Visit, to All Saints' Church, Tooting.

Saturday, May 12.

EDINBURGH ARCHITECTURAL ASSOCIATION.—Associates' Visit to St. Andrew Steel Works.

Monday, May 14.

SURVEYORS' INSTITUTION.—Ordinary General Meeting at 8 p.m.

Wednesday, May 16.

ARCHITECTURAL ASSOCIATION.—Annual Dinner, Georgian Hall, Gaiety Restaurant.

REINFORCED CONCRETE.

The Kahn System.

IN this country we were tardy in adopting reinforced concrete, but now that we are waking up to its utility several firms well-known in America and on the Continent are bringing their systems over to take a share of the work. The Trussed Concrete Steel Co., who work the well-known Kahn system of America, have recently opened an office at Caxton House, Tothill Street, Westminster, and have issued a catalogue which is one of the best we have seen in connection with this branch of construction. It is, indeed, more than a catalogue; it is a useful treatise on the principles of reinforced concrete construction, and all professional men should study it. Formulae, tables, a specimen specification, and other information of practical use are included, together with illustrations of works executed on the Kahn system. There are several features in this system which require explanation as differentiating it from other well-known types. The basis is the patent bar, which is rolled in steel to the section shown in Fig. 1. The projecting wings on either side are sheared up to do the duty of stirrups in other systems; that is to say, they bond both the layers of concrete in which such work is brought up the required

FIG. 1.—CROSS-SECTION AND VIEW OF KAHN TRUSSED BAR.

thickness and reinforce members against shear.

The following is an explanation of the action of these bars in beams—the most important detail of reinforced concrete construction. Anyone who understands the theory of stresses in beams will know that the top of the beam acts in compression while the bottom is in tension. The lines of principal tensile stress curve upwards from the centre of the span towards the supports, while the lines of compressive stress are exactly the reverse, curving downwards from the centre of the beam at the top to the bottom of the beam at the supports. In the centre these lines are flat, curving sharply upwards and downwards at the supports; they cross each other at right angles. With the distributed load which beams are usually called upon to sustain the shear is greatest near the points of support. Now concrete is weak in tension and strong in compression, consequently when loaded heavily the concrete cracks inwards along the lines of compressive stress. As the loading becomes greater the shear force extends these cracks

FIG. 5.—KAHN BAR WITH STAGGERED DIAGONALS.

FIG. 6.—METHOD OF REINFORCING CONTINUOUS BEAM AT POINT OF CONTRAFLEXURE.

inwards along the lines of compressive stress, owing to the weakness of the concrete in tension. This is clearly shown in Fig. 2, which is a photograph of a beam tested by the United States Government War College. The vertical members of the Kahn bar cross these cracks at right angles, being bent upwards to an angle of 45 degs., and prevent the concrete opening by shear in this way.

In regard to this some theorists have reasoned that it is unnecessary to consider shear in a beam, but apparently this is based on the consideration of concentrated loads or small spans. Where a beam sustains distributed loads it is most important to reinforce

rigidly attached shear members. The importance of this point is considerable. This rigid connection allows the strength to be so much more easily calculated. We have not to depend upon the elastic limit of the steel, but can take a factor of safety of 4 on the ultimate strength.

Where beams are of considerable depth it will be apparent that if the bar were sheared, as shown in Fig. 1, the shear members could not be made long enough to extend to the top of the beam, but by staggering these, as shown in Fig. 5, they can be of any depth. The tension members require to be of greatest strength in the centre of the beam and can diminish towards the supports. Thus, in

FIG. 3.—DIAGRAM SHOWING TRUSS ACTION.

against shear. This vertical reinforcement may be explained on the principle of truss action (see Fig. 3). The concrete acts, as shown, as the vertical compression member of a truss. Another way of looking at the action of the Kahn reinforcement is illustrated in Fig. 4, showing a flat lintel. The load tends to push the keystone down, which can only be done by pushing aside the voussoirs of the arch, and thereby causing a thrust on the skewbacks or wall, the last ordinarily supplying the horizontal resistance. If the wall be taken away this horizontal thrust can be supplied by a steel tension member turned up at the ends, with prongs connected thereto passing between the blocks. Now this brings us to the point in the Kahn system. It will be clearly seen that unless these prongs were rigidly connected to the tension bar at the bottom they would slip along with the voussoirs and not transfer the stress to the tension member. Tests have shown that loose stirrups have slipped along the bars when the beams have been tested to failure. Tests have shown about 33 per cent. increase of strength that comes by the use of

calculating the strength, the entire area of the section, including wings, must be taken.

With continuous beams the Kahn bar is placed reversed, as shown in Fig. 6, at the point of contraflexure. In columns the bars have the prongs bent in one direction, and extend inwards from the angles of the centre, as shown in the general view of the system in Fig. 7, thus forming practically a latticed column. These prongs take the place of the links or wire binding in other systems.

The Kahn bar is equally efficient in other conditions. It has been used extensively for footings, retaining walls, bridges, sewers, water-tanks, &c. It is obvious that the reinforcement being all joined together as a unit, it can be conveniently handled and put in position without risks of getting out of place, such as arise with careless workmen. Consequently the Kahn system is most economical. Fig. 8 shows the manner in which a Kahn floor is laid. There are no royalties with this system. For further particulars we would refer readers to the catalogue issued by the Trussed Concrete Steel Co.

(Continued from p. 239.)

May 17. Great Leighs.—Structural alterations, and building new classroom, to the Council School, Great Leighs. Plans, specifications and form of contract may be inspected at the office of the architect, Frank Whitmore, 73, Duke Street, Chelmsford, between 10 and 5, on any working day except Saturday. Builders desirous of tendering must send in their names and addresses to the architect on or before May 3, when copy of bills of quantities will be supplied to each applicant if references are satisfactory. Sealed tenders, endorsed "Tender for Great Leighs School Works," should be sent to J. W. Nicholas, secty., County Offices, Duke Street, Chelmsford, by May 17.

May 21. Lochgelly.—Mason, brick, joiner, plumber, concrete, plaster, slater, iron, steel and glazier works for proposed bakery premises, Lochgelly, for the Lochgelly Co-operative Society, Ltd. Plans and specifications may be seen, and all further information obtained, on application to James T. Scobie, architect, Dunfermline and Lochgelly. Schedules of measurements may be had from the Secretary on payment of £1 1s. The estimates to be lodged with the secretary, John Mitchell, on or before 10 a.m. on May 21, marked "Tender New Bakery Premises," on envelope.

No date. Glasgow.—Erecting a large number of villa residences on a building estate near Glasgow. Drawings and schedules and full particulars will be supplied by R. Anderson, 39, Victoria Street, Westminster, London, on deposit of £2 2s.

No date. Wimborne.—Erection of a pair of villas at Wimborne. Plans and specification may be seen at the offices of Charles Munckton, surveyor, Wimborne.

No date. Monmouth.—Erection of a residence in Redbrook Road, for H. F. Perkins, Hadnock Court. Intending contractors should send their names to Ernest G. Davies, M.S.A., architect, 7, Bridge Street, Hereford, and 25, Agincourt Square, Monmouth, when specification and form of tender will be supplied.

ENGINEERING.

May 3. Manchester.—Supply of a one ton hand Scotch derrick crane, 35ft. jib complete. To be delivered at Denton station (L. and N.W. Ry.). Tenders, endorsed "Tender for Crane," and addressed to the Chairman of the Waterworks Committee, Town Hall, Manchester, must be delivered not later than May 3.

May 4. Walsall.—Heating and hot-water supply, laundry alterations, &c., at Walsall and District Hospital. Plans and specifications can be seen on application at the hospital between 10 and 5. Tenders are to be sent to E. J. Brookes, chairman, Leicester Street, Walsall, before noon on May 4.

May 4. Northfleet.—Construction of a swimming bath, 80ft. by 30ft., at the rear of the Factory Club. Plans and specification may be seen at the Secretary's Office between 10 a.m. and 8 p.m., and tenders, marked "Tender for Swimming Bath," must be delivered to W. H. Steadman, secty.

May 5. Llanuwchllyn.—Erection of a steel girder bridge with masonry abutments, at Llanuwchllyn, in the county of Merioneth. Intending competitors may estimate for the whole work or for the masonry or steelwork only. Plans and specifications may be seen at the office of the County Surveyor, at Arthog, Dolgellay, to whom tenders are to be sent not later than May 5.

May 5. Talylyn.—Erection of a small girder bridge at Talylyn, in the county of Merioneth. Intending competitors may estimate for the whole structure, or for the masonry or steelwork only. Plans and specifications may be seen at the office of the County Surveyor, at Arthog, Dolgellay, to whom tenders are to be sent not later than May 5.

May 5. Standish.—Constructing a service reservoir near Prospect Hill, in Standish; also for 75 tons of cast-iron water mains, for the U.D.C. Drawings may be seen and copy of bills obtained on application to Heaton, Ralph & Heaton, engineers, Wigan, on a deposit of £1 1s. Sealed tenders, endorsed "Tender for Reservoir," to be delivered to J. H. Richards, clerk to the Council, Standish, by May 5.

May 12. Portsmouth.—Additions to the Stanshaw pumping station, with new engine pump and rising main in Simpson Road, Stanshaw. On payment of the sum of £2 2s. a lithographed copy of the specification, general conditions and bill of quantities, with form of tender, can be obtained on application to the Town Clerk, and any further particulars can be obtained at the Borough Engineer's Offices, at the Town Hall, Portsmouth. Tenders, marked "Tender for Stanshaw Pumping Station Rising Main, &c.," must be filled up, signed and returned with the bills of quantities, duly filled in, to Alexander Hellard, town clerk, Town Hall, Portsmouth, not later than 10 a.m. on May 12. Fair wages clause.

May 14. Edinburgh.—Arc lamp posts. The specification, form of tender and drawings can be obtained from the Electrical Engineer, Dewar Place, Edinburgh, on payment of a deposit of £2 2s. Tenders on the prescribed form, enclosed in sealed envelopes and endorsed on the outside "Tender for Arc Lamp Posts," must be sent to the Town Clerk, City Chambers, Edinburgh, not later than May 14.

May 14. Langley Moor.—Repairs to Esh Bridge. Contractors desirous of tendering for this work may receive particulars from G. G. Donkin, surveyor, Langley Moor, by appointment. Tenders to be delivered to J. G. Wilson, Durham, on or before May 14.

May 14. Manchester.—Extension of the refrigerating machinery and plant at Smithfield Market. Specification and form of tender may be obtained on application at the City Surveyor's Office, Town Hall, Manchester, on payment to the City Treasurer of £2 2s. All cheques or postal orders are to be made payable to the order of "The Corporation of Manchester." Tenders, enclosed in the official envelopes and addressed to the Chairman of the Markets Committee, to be delivered at the City Surveyor's Office not later than noon on May 14.

May 15. Clare.—Carting, excavating for and laying and jointing of about 3 miles of 4in. and 3in. cast-iron water-mains, including fixing valves, hydrants, &c., the erection of brick service reservoir, pumping station, and all works in relation thereto, for the R.D.C. Plans and specifications may be seen, and copies of the quantities and form of tender obtained from the engineers Sands & Walker, Milton Chambers, Nottingham, on payment of £2 2s. (by cheque). Sealed and endorsed tenders to be sent to S. L. Bigmore, clerk to the Council, Haverhill, Suffolk, on or before 10 a.m. on May 15.

May 15. Warrenpoint.—Construction of sea baths for the U.D.C., in accordance with plans and specifications prepared by Kaye, Parry & Ross, civil engineers and architects, 63, Dawson Street, Dublin. For the convenience of persons tendering for the above works bills of quantities, based upon the plans and specifications, have been prepared by Beckett & Medcalf, quantity surveyors, but their accuracy is not guaranteed. Copies of these bills can be obtained at the offices of the Architects on payment of £1. Tenders, enclosed in sealed envelopes, marked "Tender for Baths," and addressed to the Chairman of the Council, must be delivered at the Town Hall, Warrenpoint, on or before May 15.

May 15. Amptill.—Water supply: (a) Supply, delivery and laying of about 7 miles of 6in., 4in. and 3in. cast-iron water mains, with sluice valves, hydrants, air valves and water-level indicator; (b) construction of engine and producer-house and brick softening tanks at Crophill and a 150,000 gallon capacity service reservoir in Amptill Park; (c) supply, delivery and erection of suction gas plants, gas engines, air compressors, surface pumps, softening plant, and well, with air lifting plant at Crophill, for the U.D.C. Drawings, specification, conditions of contract and forms of tender may be seen on and after May 3 at the offices of the engineers, W. R. & W. Phillips, Luton, Beds, from whom copies of same can be obtained on payment of £2 2s. for each (a) (b) and (c) contracts, half of which sum will be returned on receipt of a bona-fide tender if the copies of plans and specifications are returned to the Engineers. Sealed tenders on the prescribed form and endorsed "Amptill Waterworks, Contract (a) (b) or (c) as the case may be, to be addressed to Alfred T. Trethewey, clerk to the Council, U.D.C. Offices, Amptill, Bedfordshire, and delivered by May 15.

May 16. Salford.—Supply and erection of a station meter (50,000 cub. ft. per hour capacity) at the Bloom Street Gasworks. The drawings may be seen and copies of the specification and form of tender obtained (for which a charge of £1 1s. will be made) on application to William W. Woodward, engineer, Gas Offices, Bloom Street, Salford. Sealed tenders, endorsed "Tender for Meter," addressed to the Chairman of the Gas Committee, Town Hall, Salford, to be delivered to L. C. Evans, town clerk, Town Hall, Salford, not later than 3 p.m. on May 16.

May 21. South Uist.—Repairing the tidal embankment at Strone Dearg, near Oaiburgh, South Uist, including erection of cofferdam and other wood framing. Construction of about 260 cub. yds. of concrete embankment with sluice ways, tidal flap valves, and other works. Schedules of quantities can be obtained from J. Wedderpoon, engineer, The Castle, Inverness, to whom tenders are to be sent by May 21. Contractors will be taken over the works on May 14 at 12.

IRON AND STEEL.

May 8. London, E.C.—Steel and cast iron bridge-work for the Bombay, Baroda and Central India Railway Co. Tenders must be made on a form, copies of which, with specification, can be obtained at the offices on payment of 12s. each (which will not be returned). Tenders to be sent to T. W. Wood, secretary, Gloucester House, Bishopsgate Street Without, London, E.C., by noon on May 8.

May 9. London, E.C.—Supply of 500 steel tyres for carriage and wagon wheels, for the Burma Railways Co., Ltd. Specifications and forms of tender can be obtained at the Company's offices, 199, Gresham House, Old Broad Street, E.C. For each specification a fee of 10s. will be charged, which will not be returned. Tenders, enclosed in sealed envelopes and marked "Tender for Steel Tyres," must be delivered not later than noon on May 9.

May 9. London, E.C.—Wrought-iron bars for the East Indian Railway as per specification to be seen at the Company's offices. Tenders are to be sent to C. W. Young, secty., Nicholas Lane, E.C., marked "Tender for Wrought-iron Bars," not later than noon on May 9. The Company reserves to itself the right to divide the order, also to decline any tender without assigning a reason. For each specification a fee of £1 1s. is charged, which cannot under any circumstances be returned.

May 15. London, S.W.—Unclimbable steel paling, for the Southern Mahratta Railway Co., Ltd., as per specification and drawing, which may be seen at the offices of the Company. The charge for the specification is £1 1s., which will not be returned. Tenders must be sent in, marked "Tenders for Steel Paling," addressed to E. Z. Thornton, secretary, 46, Queen Anne's Gate, S.W., not later than noon on May 15.

May 15. Clare.—Supply and delivery at Clare of about 170 tons of cast-iron water-pipes and specials, 4in. and 3in. diameter, and other works. Specification and bill of quantities may be obtained from the engineers, Sands & Walker, Milton Chambers, Nottingham, on payment of £2 2s. (by cheque). Sealed and endorsed tenders to be sent to S. L. Bigmore, clerk to the Council, Haverhill, Suffolk, on or before 10 a.m. on May 15.

PAINTING AND PLUMBING.

May 3. Ganarew.—Re-decorating Ganarew church. Specification may be seen and particulars obtained of H. Webb, Ganarew, to whom tenders must be delivered not later than May 3.

May 3. Haworth.—Painting required to be done to the whole of the property of the Haworth Industrial Co-operative Society Ltd. Specification and details may be had from the Secretary. Tenders to be in not later than 6 p.m. on May 3, endorsed "Painting."

May 3. London and Burton.—Painting, &c., as follows:—(1) Cleaning and painting at Poplar Goods Depot, London. (2) Cleaning and painting engine sheds, &c., at Burton. Specifications may be seen, quantities and particulars obtained on application at the Engineer's Offices at Derby. Sealed tenders to be forwarded by post to the Secretary of the Way and Works Committee, Midland Railway, Derby, not later than 9 a.m. on May 3.

May 3. Skipton and Ingleton.—Painting, &c., to buildings, &c., at Skipton and Ingleton, for the Midland Railway Co. Specification may be seen, quantities and particulars obtained on application at the Engineer's Office, Derby. Sealed tenders to be forwarded by post to the Secretary of the Way and Works Committee, Midland Railway, Derby, not later than 9 a.m. on May 3.

May 7. Stafford.—Painting bridges and fencing, also for the exterior painting of Elmhurst, Tillington, and the thirty-one municipal cottages, Crooked Bridge Road. Forms of tender and other particulars can be obtained on application to W. Blackshaw, borough engineer, Borough Hall, Stafford. Fair wages clause. Sealed tenders (in official covers) shall be delivered at the Town Clerk's Office, Martin Street, Stafford, not later than 10 a.m. on May 7.

May 9. Sunderland.—Painting and colouring the following schools during the Midsummer Holidays, viz.: Haswell and Station Town, windows inside and wood and ironwork outside only, Trimdon Foundry; Wheatley Hill, Wingate and Wingate Grange. Applications for specifications and forms of tender, stating for which school or schools same are required, may be obtained from C. Neate, district clerk, Haswell, Sunderland, to whom tenders must be returned by May 9.

May 10. London, S.E.—Whitewashing, cleaning and painting work at the Infirmary, East Dulwich Grove, S.E. The specification can be seen and all information obtained at the offices of the Steward of the Infirmary as above, between 10 and 4. Tenders, endorsed "Painting, &c.," should be addressed to the Guardians of the Southwark Union and delivered at the Union Offices, John Street West, Blackfriars Road, S.E., by 4 p.m. on May 10.

May 10. Peterborough.—Supply of lead pipe, plumbers' metal, and pig lead for twelve months for the Town Council. Further information and specification with forms of tender may be obtained on application at the City Engineer's Office, Market Place, where sealed tenders must be delivered on or before May 10.

May 14. London, S.E.—Cleansing, repair and painting of schools, to be executed during the summer vacation. Persons desiring to tender are requested to make written application to William Jacques, A.R.I.B.A., architect to the Education Committee, 2, Fen Court, E.C., for copy of specification and form of tender on or before May 5, which application must be accompanied by a deposit of £1 (cheques will not be accepted). Sealed tenders in the envelope supplied to be delivered at the Education Department, 95, The Grove, Stratford, E., not later than 5.30 p.m. on May 14. Fair wages clause.

May 22. Cardiff.—Painting the cab shelters of the Corporation. Further particulars may be obtained from the Head Constable, Chief Police Station, Cardiff. Tenders, endorsed "Painting Cab Shelters," must be delivered to the Town Clerk, Town Hall, Cardiff, before May 22.

No date. Exeter.—Painting. Persons willing to tender for repairs and painting at the United Almshouses, Parr Street, Exeter, are requested to send their names to C. E. Ware, 18, Bedford Circus, when copy of specifications will be supplied.

No date. Peterborough.—Iron fencing and painting at Old Fletton Cemetery. Particulars to be obtained from W. Mellows, solicitor, Queen Street, Peterborough, clerk to Burial Joint Committee.

Ogden Hardicker, clerk to the Council, Northern Assurance Buildings, Albert Square, Manchester, by May 25.

No date. Plympton St. Mary.—Making a road-way, about 600 yds. in length and 12ft. wide, from George

Lane to Lower Chaddlewood Farm, in the parish of Plympton St. Mary, for G. W. C. Soltau-Symons. Plans and specifications may be seen and further particulars can be obtained of G. W. Soltau, surveyor, 7, Courtenay Street, Plymouth.

SANITARY.

May 3. Cork.—Execution of the following works, according to specifications, which may be inspected at the Boardroom, Cork Workhouse, for the R.D.C.:—(a) Laying sewer at Dock Street, Passage West; (b) building wall to enclose reservoir at Plarney Waterworks. Each party tendering is required to give the names and addresses of two solvent sureties who are willing to join in a bond for the due performance of Contract. Tenders to be sent in to John Corter, clerk of council, Boardroom, Workhouse, Cork, by noon on May 3.

May 3. Leiston-cum-Sizewell.—Sewering of part of Snape Road. About 423 yds. of 9in. pipes with manholes, gullies, &c., in accordance with the drawings and specifications, which may be seen at the office of James Baldry, Snape Road, Leiston, surveyor. Tenders, sealed and marked "Sewering," to be sent to John Fry, clerk of the council, Saxmundham, by May 3.

May 4. Penrith.—Construction of about 2,500 yds. of 21in. stoneware main outfall sewer and contingent works, for the U.D.C. General conditions, specifications, bills of quantities and forms of tender may be obtained, and drawings inspected, at the Town Hall, Penrith, upon receipt of a deposit of £2 2s. Full information may be obtained from the engineers, Brierley, Holt & Co., of Blackburn and Blackpool, or from the resident engineer, J. J. Knewstubb, Town Hall, Penrith. Sealed tenders, endorsed "Penrith Sewerage—Contract No. 1," must be delivered to George Wainwright, clerk of the Council, Town Hall, Penrith, not later than May 4.

May 4. Manchester.—Sewering, draining and paving the following streets and passages, for the Corporation:—Buxton Street, from the passage adjoining No. 19, Buxton Street, to a point 34 yds. distant in a westerly direction, West Gorton, South Manchester. Sutton Street, from the end of the existing paving opposite No. 22 to the boundary wall at the end of such street, West Gorton, South Manchester. New Square, West Gorton, South Manchester. Passage behind 2 to 12, Buxton Street, and adjoining 2, 4 and 12, Buxton Street, West Gorton, South Manchester. Passage behind 25 to 33, Buxton Street, 2 to 12, New Square, and adjoining 2 and 12, New Square, West Gorton, South Manchester. Passage adjoining 19 and 21, Buxton Street, and 20, New Square, West Gorton, South Manchester. Draining, flagging, and curbing passage behind 7 to 13, Charles Street, and adjoining 2, Buxton Street, West Gorton, South Manchester; also the passage adjoining 22, Sutton Street, West Gorton, South Manchester. Forms of tender may be obtained on application to the Paving, &c., Department (Surveyor's Office), and must be returned to the Chief Clerk, Paving, &c., Department, Town Hall, Manchester, before 10 a.m. on May 4.

May 5. Heath Town.—Sewering, levelling, paving, kerbing, channelling and making generally of Tudor Street, for the U.D.C. The drawings may be seen and specification and form of tender obtained at the office of Berrington, Son & Martin, civil engineers, Lichfield Street, Wolverhampton, on payment of £2 2s. Tenders must be delivered to J. W. E. Stirik, clerk to the Council, Lichfield Street, Wolverhampton, enclosed "Tender for New Street," before noon on May 5.

May 7. Macroom.—Construction of sewerage works in the town of Macroom in accordance with plans and specification prepared by A. W. Barnard, C.E., to be seen at the office of the Clerk. Sealed tenders, addressed to the presiding chairman, and containing the names of two solvent sureties willing to enter into a bond with the contractor for double the amount of the contract for the due and faithful fulfilment of same, to be lodged in the tender box in the Council office up to 4 p.m. on May 7. A sum of £10 in cash to be lodged with each tender. (Cheques will not be accepted.) The contractor will be required to give preference to Irish-manufactured goods in all cases where procurable, prices being equal.

May 7. Surbiton.—Construction of a 9in. sewer, with manholes, flushing tanks, &c., and reconstruction of house drains at Oak Hill Grove, for the U.D.C. Tenders, made out on the form and sealed in envelopes supplied, must be delivered at the District Council Offices at or before 10 a.m. on May 7. Plans and specifications may be inspected and a copy of the surveyor's estimated quantities obtained on application to the Surveyor during office hours. The quantities will not be supplied until the plans and specification have been inspected.

May 8. Barnstaple.—Erection of new lavatory buildings and general alterations, and for plumbing work in connection therewith, at the North Devon Infirmary, Barnstaple. Application should be made at once to J. C. Southcombe, architect, Barnstaple, from whom plans, specifications and quantities may be obtained, and tenders to be sent to J. B. Symons, secy., on or before May 8.

May 11. Fleetwood.—Construction of the pumping station buildings, storage tanks, mains, screens, fences, &c., at Fleetwood. The drawings, prepared by George R. Strachan, M.I.C.E., may be seen, and copies of specification and bills of quantities obtained at the Clerk's office on payment of a deposit of £5. Sealed tenders, endorsed "Tender for Pumping Station, &c.," are to be delivered at the Clerk's office at or before 10 a.m. on May 11.

May 14. Acton.—Construction of 3½ miles of sewers, varying from 6ins. to 6ft. in diameter, 2½ acres of filter beds, and various works connected therewith, for the U.D.C. Instructions for tender and forms of tender, with the form of contract and schedules annexed, can be obtained and the drawings inspected at the offices of Sir Alexander Binnie & Sons, 9, Great George Street, Westminster, on payment of £2. Tenders, enclosed in a sealed cover and addressed in the manner provided in the instructions for tender, must be received at the offices of the clerk to the Acton U.D.C., 242, High Street, Acton, not later than May 14.

May 14. Cheshunt.—Works to be carried out at the sewage-disposal works in the parish of Enfield, for the Cheshunt U.D.C. The works comprise the construction of an add-on to the existing engine-house, a tank, No. 4 filters, the supply and erection of engines and centrifugal pumps in duplicate, the laying out of land, together with all necessary carriers, mains and other incidental works. Drawings and specifications may be seen at the office of the engineers, Pollard & Tingle, 31, Old Queen Street, Westminster, and at the offices of the Council. Form of tender can be obtained only from the clerk to the Council upon deposit of £5. Bills of quantities can only be obtained from the Engineers upon production of the form of tender. Sealed tenders, addressed to the Chairman of the Council and endorsed "Sewage-Disposal," are to be delivered at the Council's Offices, Manor House, Cheshunt, Herts, before 4 p.m. on May 14.

May 15. Maesteg.—Sewerage works. Contract No. 1: 333 lineal yds. of 9in. stoneware pipe sewer, 1,191 lineal yds. of 6in. stoneware pipe house connections, 493 lineal yds. of 4in. stoneware pipe house connections. Contract No. 2: 237 lineal yds. of 9in. stoneware pipe sewer, 1,117 lineal yds. of 6in. stoneware pipe house connections, 560 lineal yds. of 4in. stoneware pipe house connections. Contract No. 3: 452 lineal yds. of 9in. stoneware pipe sewer, 431 lineal yds. of 6in. stoneware pipe house connections, 222 lineal yds. of 4in. stoneware pipe house connections. Together with all the necessary manholes, inspection chambers, ventilating shafts, junctions, &c., relating to the three contracts. Plans, sections and specifications may be seen and copies of the bill of quantities and form of tender can be obtained from the engineer, Joseph Humphreys, C.E., Town Hall Chambers, Maesteg, Glam., on payment of a cheque for £2 2s. A charge will be made of 2s. 6d. for each separate copy of the bill of quantities of Contract No. 1, 2s. 6d. for copies of Contract No. 2, and 2s. 6d. for copies of Contract No. 3. On receipt of cheque (which should be a separate one to the £2 2s. cheque) copies will be sent. Sealed and endorsed tenders to be sent to Joseph Humphreys, C.E., engineer and surveyor to the Council, Town Hall Chambers, Maesteg, Glam., on or before 1 a.m. on May 15.

May 16. Salford.—3,500 sq. yds. of hard floor tiles, similar to the sample which may be seen at the Salford Sewage Works, Weaste. Forms of tender and particulars may be obtained at the Borough Engineer's office, Town Hall, Salford. Tenders, endorsed "Filter Tiles," addressed to the chairman of the River Committee, must be delivered to L. C. Evans, town clerk, Town Hall, Salford, by noon on May 16.

MISCELLANEOUS.

May 3. London, E.C.—Supply of the following stores, for the Great Indian Peninsula Railway Co.:—Miscellaneous articles and materials; fencing wire strand; Sheffield tools, &c.; fencing materials. Specifications and forms of tender may be obtained at the office on payment of the fee for the specification, which payment will not be returned. Tenders must be delivered in sealed envelopes, marked "Tender for Miscellaneous Articles," or as the case may be, addressed to J. I. Berry, secy., 48, Copthall Avenue, E.C., London, not later than 11 a.m. on May 3.

May 10. Melford.—Supply of the undermentioned materials, &c., for the R.D.C.:—Broken granite; glazed sanitary drain-pipes, 4ins. to 4½ins. diameter; blue Staffordshire bricks and kerbs; York stone kerb; Portland cement; granite concrete flags; flints; chalk; road grates and frames; team labour; tools; steam rolling. Forms of tender and other information may be obtained from W. Carver, C.E., surveyor, 3 Melford Road, Sudbury, Suffolk. Sealed tenders to be sent in not later than May 10, addressed to H. C. Canham, clerk, 68, Friars Street, Sudbury, Suffolk.

May 14. Hanley.—Works. Destructor works—clinker-crushing plant; mortar mill; steam engine; alternating current motor. All the above are for hiring terms per annum, with option of purchase by the Corporation. Sewers for the diversion of mine water, Etruria Canal Bridge to Bell's Mill Pool; two 12in. centrifugal pumps, for the sewage works. Private street improvement works:—Contract No. 364, Waterloo Street; contract No. 365, Commercial Road; contract No. 366, Eagle Street; contract No. 367, passages off Albert Street; contract No. 368, back Steadman Street; contract No. 369, back Bucknall Road North; contract No. 370, back Mulberry Street; contract No. 371, back Bucknall Road South; contract No. 372, back Homer Street West; contract No. 373, back Homer Street East; contract No. 374, back Seymour Street; contract No. 375, back Jasper Street. All as fully described in the minutes of the Council and on the plans. Specifications, bills of quantities and forms of tender may be obtained and plans inspected at the Borough Engineer's Office, Town Hall, Hanley. Fair wages clause. Separate sealed and endorsed tenders must be sent to Joseph Lobley, borough engineer and surveyor, Hanley, by May 14.

May 15. London, E.C.—Supply of the following stores, for the South Indian Railway Co., Ltd.:—(1) Steel rails (4½ lbs. and 50 lbs.), 1,742 tons, and fishplates for the same 85 tons; (2) cast-iron sleepers, 1,750 tons; (3) tie bars, gibs and cotters, 139 tons; (4) fishbolts, spikes and bearing plates, 98 tons; (5) iron wire fencing and steel pales, 32 tons; (6) general stores, comprising iron, steel, metals, oils and co'ours, electric stores and sundries; (7) locomotive stores, comprising copper and steel plates, tyres, axles, springs, and brass and steel tubes. Specifications and forms of tender may be obtained at the Company's offices. Tenders, addressed to the Company, marked "Tender for Rails," or as the case may be, must be left with Henry W. Notman, managing director, 55, Gracechurch Street, London, E.C., not later than noon on May 15. A charge, which will not be returned, will be made of 10s. for each copy of specifications Nos. 1, 2 and 6, and of 10s. for each copy of the others. Copies of the drawings may be obtained at the office of Sir George B. Bruce, 3, Victoria Street, Westminster, on payment of 5s. per sheet.

Bankruptcies.

[Abbreviations: R.O.—receiving order; P.E.—public examination; C.C.—county court; O.R.—official receiver; Adj.—Adjudication.]

DURING THE WEEK ending April 27th eighteen failures in the building and timber trades in England and Wales were gazetted.

J. TYSON, builder, Egremont. R.O. April 18th.

G. ARCHER, builder, St. Albans. R.O. April 18th.

N. W. HAINES, plumber, Swindon. R.O. April 21st.

A. SUCKLING, builder and contractor, Halstead. Adj. April 20th.

J. H. MEREDITH, builder, Hambledon. P.E., Southampton C.C., May 23rd, at 12.

BELL & TROUGHTON, builders and contractors, Lancaster. P.E., Preston Sessions Hall, May 4th, at 11.

W. DRAKE, builder and contractor, Poulton-le-Fylde. R.O. April 18th.

LANGTON & Co., builders' merchants, Brentford and Twickenham. Adj. April 19th.

C. STEARN & Co., builders, decorators and plumbers, Ipswich. P.E., Shirehall, Ipswich, May 18th, at 10.30.

J. BARRY & Son, builders and contractors, Scarborough. P.E., Scarborough C.C., May 22nd, at 12.

F. PHIPPS, builder, Foxcombe Hill, Oxford. Gross liabilities, £7,187; expected to rank, £2,834. Assets estimated to produce £691.

Rodin's "Le Penseur" has been presented to the city of Paris by a group of admirers, and is now placed on a pedestal immediately in front of the steps of the Panthéon.

BAYLISS, JONES & BAYLISS LTD.

Theory and Practice. WHAT do these terms comprise? What is their connection with the building trades? These questions seem to be little thought out by the majority of those engaged in the industry. Being an industry where most of those in it are engaged in the direct execution of works, they are accustomed to flatter themselves on being practical men, and sneer at the men of theory. It is evident that these "practical" men are ignorant of the meaning of the word. They are ready to admit that rule of thumb is undesirable and that a man should exercise his intelligence, as they call it, but they fail to recognize that immediately they go outside the former and resort to the latter, they are exercising theory. They look upon the man of theory as a dreamer, a man who goes to his imagination for his facts, and one who is divorced from the opportunity of proving his assumptions. However true this last unfortunately may be of many men of theory,

it would be absurd to sneer at theory because certain exponents betray insufficient acquaintance with facts. Theory is based on practice. It is the interpretation of fact. Theory is hypothesis to explain phenomena; it is method, an ordering, a scheme of established facts, and an exposition of their ascertained principles for the purpose of future practice. Without theory you can have little or no progress, but of course theory cannot go on alone; it must continually be put to the test and corrected and revised by reference to practical experience. The time has gone by when a man did a thing because his forefathers did it so before him. Nowadays he desires to know the why and wherefore, and the reason which he gives for his action is his theory. We all act on precedent, to a certain extent, but no one acts in all future circumstances just as he did before—to do that would be mere instinct, without reason. We could wish that there was a little more theory in the building trade, a little more science, a little more initiative, a little more progress, and a little more experimentation and invention. Scientific investigation always proceeds from the determination of empirical facts to their hypothetical generalization. The generalizations are stated as theoretical laws. The mistake that is often made by theorists and men of science comes in just here, for they suppose that these laws are finally established beyond dispute or modification. We know nothing absolutely. It is a necessity and a sign of progression that these theoretical generalizations should be constantly altering as fresh facts come to light, leading to new points of view. We admit that there is often a want of appreciation among theoretical men that the method by which investigation usually proceeds is to put the theory to the test by endeavouring to draw conclusions from the generalizations or laws, and then seeing if the facts or results agree with these conclusions. If they do not, the theory should of course be modified to fit the facts, not the facts distorted to fit in with the theory. The architect and engineer are primarily men of theory; they should be careful to see that their theory is consonant with fact. There are not enough tests carried out in connection with the building trades. We depend mostly upon a few unscientific and obscure tests that have been carried out by private individuals in the past, or on tests by foreign Governments and professional bodies in the United States, Germany and France. It is distinctly a disgrace that England should lag behind in this manner. It is true we have engineering laboratories in this country which occasionally test materials and forms of construction employed in building practice as well as engineering, but there should be several testing laboratories and professorships established for building construction pure and simple.

The Candid Art Critic. JUST now, with the critics only half-way through their Academy notices in the newspapers, the fact is borne in upon some of us that there is indeed a very great deal of bias in the majority of the criticisms. We are all creatures of circumstance, but it is surprising how unfair a critic can let himself become to those exhibitors who happen to be under the bin. It has been urged that to be interesting or forceful one must be a partizan of some sort, and doubtless the biblical stigma of the luke-warm has a just application; at the same time, as an actual example, one has only to go round the galleries at Burlington House, and to read the published notices of the exhibits there, in order to feel the truth of our accusation. As this is not a journal devoted to the exploitation of art in the form of oil paintings, we do not propose to give any lengthy list of instances illustrating our contention, though to do so would be easy. We simply make a plea for fairer criticism. There are pictures in this year's Academy which, because they are the work of eminent painters, are spoken about in the suavest manner, though some of them are foolish productions, far below the level of others by little-known men; while some exhibitors whose pictures have hitherto been of a very "popular" kind, puerile in subject and photographic in technique, never get the glimpse of a fair hearing; they suffer for their past sins! We call to mind one painter especially who, in our opinion, has hitherto won popular favour with views of fluffy mountains and the same familiar cattle—pictures which, we think, are the poorest stuff: yet any fair critic would be bound to admit that this year, in another subject, he has painted a really fine picture, though he is not likely to get that credit for it from the self-elected sages. We do not find fault with a man for keeping on in one phase, provided he gives us a reasonable variety: it is when his models are always the same, merely changed about from here to there, as though he had a stock lot of objects to display right and left and left and right—it is then he deserves to be shouted down: but because he has made a muddle in former years, that is no reason why he should not be accorded a fair hearing this year; he may forsooth have taken the well-administered precepts to heart, for which the kindly critic can take unction to his soul; but at present the critic does nothing of the sort, he just keeps on wallowing, wallowing and wallowing, and becomes as hackneyed as the objects of his satire; at the same time shutting out his genuine judgment of pictures by men who, because of the canons, he is supposed to admire. That is a false position, and we should like more often in art criticism to feel that the critic wrote what he really thought, not what he thought he ought to think, according to respectable precedent.

ARCHITECTURE AT THE ACADEMY.

ONE year and another we have tried all the various ways of giving a notice of the architectural exhibits at the Academy, but the same difficulty presents itself: one has either to take a few of the outstanding exhibits and discuss them in detail, leaving the reader uninformed of what else there is to see, or to degenerate into a mere catalogue, taking drawing after drawing, which, to say the least of it, is a very dull method. A middle course seems to be the best way out of the difficulty, so we have followed that course in the present notice.

Everyone who has been to the Academy knows what a tiring job it is to go round looking at the scores of pictures on the walls, and we can assure our readers it is no less irksome for the writer of any notice of them. The architectural room of course only comprises what is comparatively a small collection, numbering fewer than 250, but even a detailed examination of each of these is no light task. The most cursory glance round the room, however, will at once pick out the most important and interesting scheme shown, namely, the rebuilding of Regent Street Quadrant, for which Mr. Norman Shaw is responsible. General satisfaction has been expressed that this work is not to be left to the mercy of any one or more architects of mediocre ability, however extensive their practice. The task of designing the Regent Street front of the new Piccadilly Hotel, as part of an intended scheme for the rebuilding of the Quadrant, is beset with many difficulties of a practical nature, and requirements of business firms, but Mr. Shaw, we think, has produced a fine scheme, though we take exception to the centre turret on the hotel roof (which is quite out of keeping with the fine square chimneys on either side), and we do not much care for Mr. Shaw's scrolls on the side wings: nor can we admire the heavily blocked columns. There can be no doubt, however, as the detail of the elevation shows, that the colonnade on the first floor, carried on the rusticated arches below, will have a noble effect when executed. We sincerely trust that the business firms in the Quadrant, many of whom we understand are contemplating new premises, will fall into line and accept this admirable scheme. In connection with it Mr. Shaw exhibits a very interesting plan for the re-modelling of Piccadilly Circus. We have a number of places in London where important streets converge, and there is no need to point out how hopelessly lacking in any sense of regularity the majority of them are; and Piccadilly Circus is perhaps the worst. Mr. Shaw proposes to put it into something like proper shape. His idea is to make a square of it, setting back the County Fire building on the north, cutting off a slice at the Monico corner, adding a new front to the London Pavilion, setting back the end between the Quadrant and Piccadilly, and putting Alfred Gilbert's Shaftesbury Memorial centrally in the space, with a square treatment around it relieved with shrubs. This scheme seems to us to be a good one and would be a notable improvement to the West End.

Turning to some of the other exhibits of a public nature, we see Sir Aston Webb's scheme for the Royal College of Science and Government offices at Dublin, about which there has been so much talk in Ireland. The general scheme is of a range of buildings around a quadrangle. Mr. T. Manly Deane is associated with Sir Aston Webb in this work, but we see little evidence of his existence: in any case the design shows nothing particularly noteworthy, though it is certainly an important work. Sir Aston Webb's detail of the new Admiralty building at the east end of the Mall is, however, very imposing and interesting, though, as classical

work, it does not compare with Mr. Reginald Blomfield's fragment of the new building for the United University Club in Suffolk Street, Pall Mall: this latter is indeed a very refined example of English Renaissance.

There is a considerable representation of designs for the Wesleyan Methodist Hall, Westminster—too many of them—no fewer than five remnants of the competition being shown on the walls, besides the accepted design by Messrs. Lanchester & Rickards.

Mr. Hare shows a very fine design for the Provident Institution building now being erected opposite St. Clement Danes Church in the Strand (one of the best designs he has produced); and Messrs. Ernest George and Yeates exhibit an excellent design for the Royal Exchange buildings. Mr. Belcher's detail of Winchester House, Old Broad Street—another block of City offices—is not very inspiring, least of all the figures dying away into the pilasters. Mr. Mountford is represented by his new town hall for Lancaster, a very dull building; Mr. Mallows, associated with Mr. Lacey, shows his excellent design for the Bournemouth town hall (already published in our pages); and among other municipal buildings there is also to be noted the Bradford town hall extension by the city architect, Mr. Edwards (with whom Mr. Norman Shaw has been associated); the Preston Sessions house, a good piece of modern Renaissance by Mr. Littler, though we think that the lanky tower would be greatly improved by having two or three stages taken off it; a poor drawing of Woolwich Town Hall, by Mr. A. Brumwell Thomas; a recuscitation of that foolish idea for building a county hall for London on a bridge across the Thames, by Mr. Ernest W. Twining; and the new municipal buildings at Tottenham, by Messrs. Tayler & Jemmett. Other good designs of a public character are Mr. Hare's Islington library, Messrs. Russell and Cooper's technical institute for Rochester, the proposed town hall at Dartmouth by Mr. Vincent Harris, new offices for the Frimley Urban District Council by Messrs. H. R. & B. A. Poulter, Messrs. Eden and Mount's second-premiated design for the Eton war memorial, the new assurance offices in Pall Mall by Mr. Norman Shaw and Mr. Ernest Newton (which combination of ability, however, has not produced anything particularly good), and Mr. Percy Adams's Women's Hospital, Soho Square—this last being a very delightful example of work. Mr. Percy Adams also shows two drawings of the King's Sanatorium, one of the north front and the other of the lodge: both of which are fine examples of brickwork design.

Church Work.

There is not a great deal of church work shown this year, but it includes a few designs of very interesting quality. One, however, which is not at all interesting we will say at once is Mr. Jackson's Giggleswick Chapel. Mr. Jackson has been responsible this year for the selections in the architectural room. He has exercised his prerogative very thoroughly, but we feel sure some of the rejected architects will smile when they look upon this design of his, and then think of those which have been thrown out by him.

Mr. Bodley is not shown to much advantage this year, his only exhibit being a rather ordinary design for a monument to the late Marquess of Salisbury in Westminster Abbey; but Mr. Skipworth exhibits a very fine design for a church at Mirfield, Yorks., a design which we feel is not falsely rendered by the drawing. (We mention this because close by there is a design for a church at Johannesburg by Mr. Fellowes Prynne. The exterior is shown by a commonplace drawing, and the design looks a medley, devoid of dignity. The effect of the interior, however, as represented by a magnificent

drawing by Mr. Charles Gascoyne (this year's Owen Jones prizeman) is quite the reverse, being dignified in the extreme, and we cannot help feeling that this effect is more due to the draughtsman than to the design. It so happens that Mr. Gascoyne has made another drawing of a church interior, by Mr. Spooner, and though he has here followed out much the same sort of treatment as in Mr. Prynne's church—to the extent of introducing a similar speckly light on the east end, and the same sombre-hued people in the foreground (for which duplication he may perhaps be pardoned)—a close inspection of the design will show that it is a very much finer piece of work. It is indeed an excellent design.)

Mr. Gilbert Scott shows a huge drawing of a detail of the elevation of Liverpool Cathedral—good powerful Gothic, with very beautiful tracery in the windows, though we cannot honestly join in the panegyrics that have been written about the building. Mr. Scott also exhibits the design for a church at Bournemouth, reproduced in our centre plates this week, a design which is certainly strange and not altogether pleasing.

Messrs. Nicholson and Corlette are represented by a number of churches large and small in various places (including the one given in our centre plate this week), and they are all very good.

Mr. Ernest Newton shows his new spire for Bickley church, a good design, though

(Royal Academy Exhibition, 1905.)

not exceptional. Mr. Bateman exhibits a squatty church at Sutton Coldfield, and Mr. Temple Moore his poor design for All Saints, Tooting Graveney. Messrs. Buckland and Farmer are represented by an interesting church near Sutton, while Mr. Mileham shows a drawing of Epsom Church—splendid in feeling, with a noble tower that reminds one somewhat of Ely, though of course it is on nothing like so large a scale.

Domestic Work.

Turning now to the domestic work exhibited, this of course is a branch of work in which English architects particularly excel; consequently there are always a number of interesting houses shown. It is quite impossible to attempt any enumeration of them, because in very few instances do they present anything sufficiently novel to call for lengthy description; yet they are quite delightful examples of that design which seems to come so easily to us, though we have only to turn to American and continental types to see that the easiness is apparent only. There are not many large country houses exhibited, the majority of the domestic exhibits being of somewhat small houses and cottages. Mr. Arnold Mitchell shows a good-looking house at Harrow Weald; Mr. Walter H. Brierley a fine house in Leicestershire, comprising hunting-lodge, stables and cottages; Mr. Baggallay his design for the rebuilding of Shenley Hill, Herts; Messrs. Ernest George & Yeates their design for Busbridge Hall, Godalming; Mr. Weir Schultz a fine house at How Green, Hever, Kent; Sir Aston Webb new almshouses at the Hendre, Monmouth; Mr. Guy Dawber a village club at Sandon, Staffs.; Mr. Geoffrey Lucas the cottages shown on p. 244 of this issue; Mr. Maxwell Ayrton some delightful cottages in Oxfordshire; and Mr. C. R. Ashbee a row of cottages at Ellesmere Port, with an old-world air about them.

Mr. Alleyne Creswick exhibits a model of a house proposed to be built at Buenos Ayres, excellent in detail and arrangement, and quite the most interesting of the three models shown in the room, the other two being of Mr. Pomeroy's Belfast monument to the late Marquess of Dufferin and Ava, and Mr. Belcher's structure for Williamson Park, Lancaster—another of Lord Ashton's gifts. This last is rather disappointing, considering the subject and the scope it offered.

Among town house architecture Mr. Henry White is well represented, but quite the most remarkable design in this branch of work is Mr. J. Atwood Slater's for a town mansion. This is really a very clever piece of design, full of originality: it is rendered, too, by an oil painting, which makes the exhibit all the more remarkable. Mr. Slater has followed, if we may say so, in Prof. Beresford Pite's vein, and has enhanced the verticality of his design by moulded pilasters at the corners of the house, stopped off some little distance from the ground; but what the strange thing at the front corner is meant to represent, we find it impossible to say—perhaps a piece of sculpture, or a shrub mysteriously growing out of the wall; in any case, a very remarkable smudge on a remarkable design. It may be a sort of joke of Mr. Slater's, in which case he finds a rival in Mr. J. M. Swan, A.R.A., who shows in the sculpture section a confused mass of silver with a large crystal on the top. It is called "Polar Bears," and truly when one has looked at it from all sides up and down, for half an hour or so, the idea of a bear climbing around at the base, and another at the top, dawns on the beholder; but the exhibit leaves him with that idea only, and if the sculpture were labelled "lead ore" and put in a suitable place in the geological museum it might strike the visitor as being eminently appropriate.

THE ACADEMY BANQUET.

Decoration of the Houses of Parliament.

AT the banquet of the Royal Academy held on Saturday evening last the president, Sir Edward Poynter, and Sir H. Campbell-Bannerman both made reference to the scheme for the decoration of the Houses of Parliament with historic paintings. Sir Edward said he had often regretted that the efforts to revive this great scheme, which came to so abrupt an end, should have been fruitless, and that the spaces so liberally provided for pictures in the Palace at Westminster should still remain unoccupied, except for a somewhat monotonous wallpaper. He ventured to say that to encourage the higher forms of art was a task—he had almost said a duty—not unworthy of the Government of the country, and that there was no better way of doing it than by commissions for great works of decorative art to occupy important public positions. The Premier said he asked himself what were the relations between the Executive Government and the Royal Academy and the artistic world at large. They had certainly nothing to do with the Executive Government itself. He did not think that the Cabinet, as a rule, lent themselves to artistic treatment. We were all familiar with pictures of a Cabinet Council—a group of heads drawn, apparently, on different scales, set uncomfortably on unaccustomed shoulders, faces some of them looking with intelligent inquisitiveness at each other, some of them with a statesmanlike gaze into vacancy, while others were turned with an ingratiating look towards the artist, or the onlooker for whom the picture was taken. All these pictures he had seen were failures. . . . Then there were the buildings. It was desirable that a public building should be externally beautiful and internally convenient. Sometimes we put up a building which was one or the other, but he had never yet known a building which combined both those qualities.

With respect to the vacant spaces on the walls of the corridors of the Houses of Parliament, Sir Henry said that in his non-Chancellor of the Exchequer character he entirely agreed with the president. It was a most extraordinary thing that there should have been an abrupt interruption of that process of decoration, and that that interruption should have been allowed to continue for all these years. But, unfortunately, at present there was another thing that would stand in the way. What were they to do with the House of Commons? They wanted more accommodation in the House. They had an inconvenient number of members, who were inconveniently anxious to do the work that the constituencies had sent them there to do. That, surely, was the first thing to be attended to before they attacked the walls, for he believed the House of Commons was the only assembly of its kind in the world that could not sit down under its own roof.

Obituary.

Mr. Thomas Garner, whose name as a church architect was so much associated with Mr. Bodley (with whom he was in partnership for more than thirty years), died last week at his house in Oxfordshire, aged 66. Among the work produced during the partnership may be mentioned the church of the Holy Angels at Hoar Cross, Derbyshire, and Lord Windsor's Hewell Grange; while—as designs solely by Mr. Garner may be cited the reredos in St. Paul's Cathedral; St. Michael's Church, Camden Town; and most recently the new chancel to Downside Abbey, near Bath.

NOTES ON COMPETITIONS.

British Medical Association's New Premises.

The limited competition for the rebuilding of the British Medical Association's premises in the Strand has just been decided in favour of Mr. H. Percy Adams, F.R.I.B.A., who was one of six invited architects. We have not seen the selected design, but Mr. Adams has already given us such a number of excellent buildings that we have no doubt this will be one more to add to the list.

Greenwich Branch Library.

We are glad to see that at their meeting last week the Libraries Committee of the Greenwich Borough Council decided to recommend the payment of an extra £15.15s. to Mr. A. W. S. Cross for the considerable additional trouble to which he was put in assessing the 172 designs submitted in the recent competition for a branch library for the borough. When dealing with this competition a few weeks ago we took occasion to point out how very thoroughly Mr. Cross had done his work. His award dealt with each one of the designs sent in and was quite a model of its kind.

The Palace of Peace.

Last Thursday, at the Hague, the jury who will make the awards in the international competition for Mr. Carnegie's Palace of Peace held their first meeting. This country is represented by Mr. T. E. Colcutt, Holland by Dr. Cuypers, Germany by Herr von Ihne, Austria by Professor Koenig, France by M. Nenot, and America by Professor Ware, who is the president of the jury.

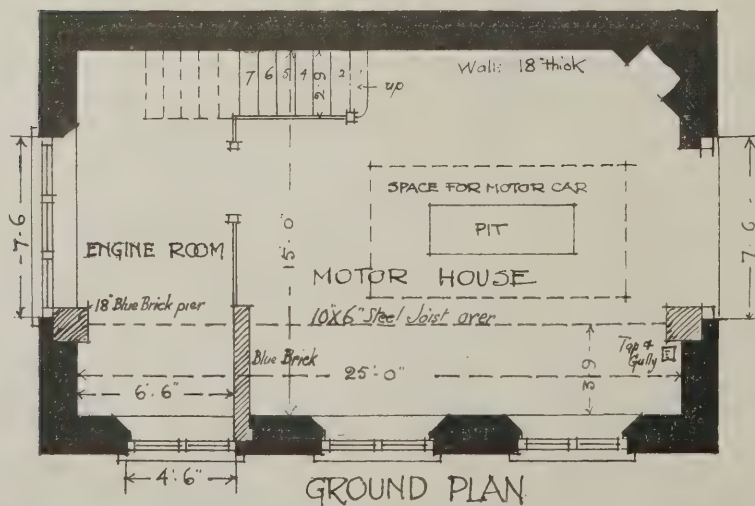

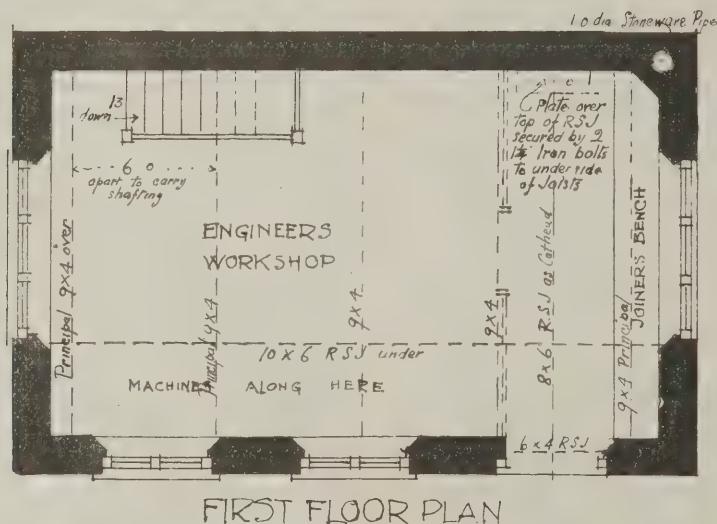

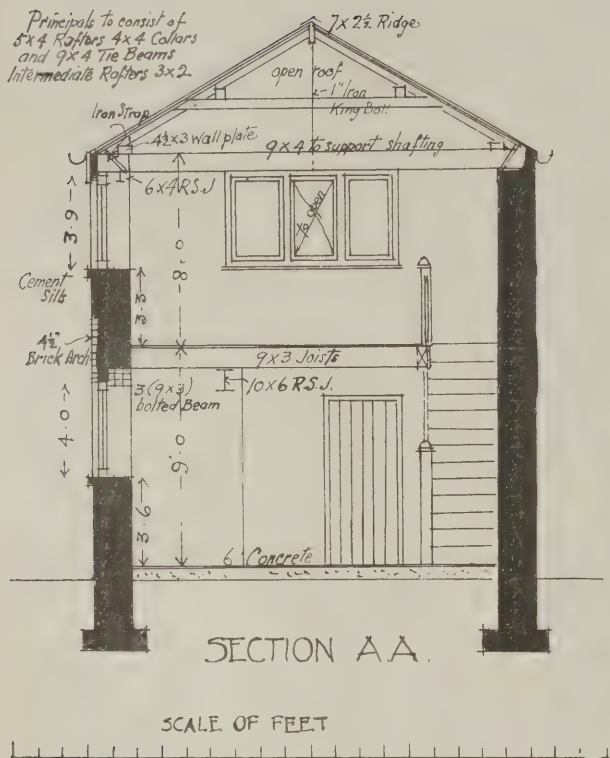

Another Cheap Competition.

With the particulars before us of the competition for a Congregational chapel at Manselton, Swansea, we expect this to be but another to add to the unsatisfactory list. A premium of seven guineas is offered for the best approved scheme—plans, sections, elevations, &c., "this amount to merge in liquidation of commission to be received in case (!) the successful competitor is engaged to carry out the work." Clause 2: "Each competitor is asked to state his terms for preparing detailed plans, specifications, and all other details of work usually done by an architect in carrying out and superintending the building." The chapel is to cost £2,200 and the schoolroom £800, and "a draft specification must accompany each scheme."

Competitions Open.

The following is a list of competitions open:—

DATE OF DELIVERY.	COMPETITION.
May 31	CHAPEL AND SCHOOLROOM AT MANSELTON, SWANSEA. Particulars from Mr. T. Roberts, 71, Brynhyfryd, Swansea.
July 2	SECONDARY SCHOOL FOR GIRLS AT AIGBURTH VALE, for the City of Liverpool Education Committee. Limited to architects in Lancashire and Cheshire. Particulars from the Town Clerk, Municipal Offices, Liverpool.
No date	DETACHED AND SEMI-DETACHED HOUSES AT CLIFTONVILLE, BELFAST.—Premiums £700. Particulars from R. J. McConnell & Co., 51, Royal Avenue, Belfast.
"	SCHOOL AT BEDMINSTER, BRISTOL, for 1,030 children. Limited to Bristol architects. Particulars from W. Avery Adams, secretary to the Bristol Education Committee, Guildhall, Bristol.
"	ALMSHOUSES AT WAREHAM. Particulars from G. C. Filliter, North Street, Wareham, Dorset.
"	VILLAGE INSTITUTE AT AYS-GARTH, WENSLEYDALE, to cost £500. Particulars from Mr. F. S. Graham, Aysgarth.

MOTOR-HOUSE AND ENGINEER'S WORKSHOP AT PORT ST. MARY, I.M.
PERCY H. TOPHAM, ARCHITECT.

MOTOR-HOUSE AND WORKSHOP.

THE motor-car having now established itself, provision for its housing and repair has to be made in connection with every modern house, especially in connection with large country houses, where the car is quite taking the place of the dog-cart and the brougham. In our issue for August 10th, 1904, we published an article giving some practical notes on the arrangement and fitting-up of motor-houses, with a plan and section of the pit generally provided for enabling the underside of the car to be got at for purposes of cleaning, inspection and repair.

On this page we give a photograph, with plans and section, of a motor-house and engineer's workshop which has been built at Port St. Mary, in the Isle of Man, from designs by Mr. Percy H. Topham, architect, of Monton Green, Manchester.

The aim has been to give as pleasing an appearance as possible consistent with the uses of the building and the materials employed. The walls are built of rubble stone-work quarried from the neighbourhood and finished with smooth stucco on the outside. The roof was made specially strong on account of the exposed situation, and also to bear the vibration of the shafting run across the principals, which had to be 6ft. centre to centre.

The floor consists of 9in. by 3in. red deal joists with 5in. tongued and grooved white deal floor boards, strengthened under the heavy machinery by a 10in. by 6in. rolled steel joist.

The motor-house on the ground floor has a height of 9ft. and the engineer's workshop on the first floor 8ft. to the tie-beam. At one corner of the motor-house a space is divided off for the engine (presumably a petrol engine) which will drive the shafting above.

Owing to the rocky foundation it was found possible to build without putting a bed of concrete under. The cost of the building was £185, the builders being Messrs. H. & A. Moore, of Port St. Mary, Isle of Man.

Views and Reviews.

Japanese Architecture.

The author of this book is a well-known architect who is noted for his sympathy with Gothic ideals, yet he has written extensively upon the subject of Japanese art—an art which has little in common with that of the West. We can hardly appreciate the architecture of Japan because we cannot enter into the feelings and methods of the Japanese. We have not the architectonic sense for Japanese architecture. The architecture of the West is mostly stone or brick, and timber building has never been so fully developed as in the Far East. This very fact prevents us easily assimilating and appreciating the architecture of Japan. Mr. Cram writes enthusiastically and eloquently of the beauties of the temples in language which we are accustomed to associate with our own canons of art, and consequently his analysis seems to be often far-fetched and inappropriate, but we have no doubt that to him, with the knowledge he possesses, no ambiguity exists. Whether he or others will be able to convince us of these wonderful unseen beauties we do not know. Japanese architects are painstaking, and they study the most minute thing, so that it requires a careful study of the most subtle curves and combinations to appreciate their work, just the same as with Greek art. Their buildings are simple almost to plainness in many cases, although the interiors of some of the temples are very rich, albeit very reserved. Often, especially in domestic work, the beauty comes by the use of colour and texture rather than form, although the latter is carefully studied and plainness does not mean want of thought. Japanese houses are of course totally different to our own, being designed to suit the ways of their occupants and the climate. The planning and construction are simple, and they afford very little for study. The Japanese have rules of conduct and habits which engender cleanliness and good health, but we should find their houses inadequate in sanitation and convenience, while in many respects they would offend against our sense of propriety. The book is well illustrated, but unfortunately the illustrations have not been printed in the best manner, and the photographs are not clear enough in detail. However, the book deserves the careful attention of all students of architecture.

"Impressions of Japanese Architecture," by Ralph Adams Cram. London: John Lane.

Perspective.

We have reviewed before "R's Method of Perspective," and probably this method is known to most architects and draughtsmen by this time. It is a most convenient method for practical work and saves an enormous amount of time and labour, giving quicker and better results than the old methods. It is easily understood from the first, but there are certain points of difficulty which this book has been written (by the author of "R's Method of Perspective," Mr. H. W. Roberts) to explain. R's method consists, we may say, in putting squared paper in perspective. The squares are marked off along the planes, both vertically and horizontally, ranged at different angles to the observer, and all one has to do is to put a sheet of paper on these diagrams and draw to scale outlines corresponding to those on the elevations and plans. Since Mr. Roberts first published his method he has had three years' experience with it, and has now threshed out the various minutiae that must arise in practice. This instruction book is the result. To anyone desirous of making ready perspectives it will be most useful, if not necessary.

"Architectural Sketching and Drawing in Perspective," by H. W. Roberts. London: B. T. Batford, price 7s. 6d. net.

NEW LONDON BUILDINGS.

AT yesterday's meeting of the London County Council the Building Act Committee reported the following applications under the London Building Act, 1894, their recommendations as to consent or refusal being appended in *italics*:—

Enclosing of a portico in front of No. 21, Hill Street, Berkeley Square, on the application of Keeble, Ltd., on behalf of Capt. H. S. Clay. (*Consent.*)

Porch to a proposed new church on the eastern side of Altenburg Gardens, Clapham Common, on the application of Kellie & Dickie, on behalf of the Rev. G. Grady. (*Consent.*)

Bay windows at Block B, The Pryors, East Heath Road, Hampstead, on the application of J. E. Yerbury. (*Consent.*)

Pair of semi-detached houses on the southern side of Netherhall Gardens, Hampstead, with projecting bay, porch and pent roof, on the application of C. H. Saunders, on behalf of Dr. J. R. Whait. (*Consent.*)

One-storey addition at the rear of the entrance lodge to St. Joseph's Home, Portobello Road, Notting Hill, on the application of W. Daniell, on behalf of the Sisters of St. Joseph's Home. (*Consent.*)

Porches in front of Nos. 159, 161, 163, 165 and 167, Hazellbank Road, Hither Green, Lewisham, on the application of Norfolk & Prior, on behalf of W. Rolfe. (*Consent.*)

Four projecting stone balconies at a building abutting upon Wigmore Street, Welbeck Street, St. Marylebone, on the application of Wallace & Gibson, on behalf of Debenham, Ltd. (*Consent.*)

Six houses on the eastern side of Knight's Hill Road, West Norwood, at the corner of Rothschild Street, on the application of Hall & Jacobs, on behalf of P. Stock. (*Consent.*)

Retention of a projecting balcony in front of Nos. 3 and 4, Sherwood Street, Finsbury, on the application of J. H. Smith. (*Consent.*)

Retention of a projecting iron sign in front of the New Theatre, St. Martin's Lane, Strand, on the application of W. G. R. Sprague, on behalf of Sir Charles Wyndham. (*Refusal.*)

One-storey shop in front of No. 12, Bective Road, Wandsworth, on the application of H. J. Cadwell. (*Consent.*)

Extension of the period within which the erection of additions in front of Nos. 49, 51, 53 and 55, Mansell Street, Whitechapel, were required to be commenced and completed, on the application of F. Selby. (*Consent.*)

Buildings on the south-eastern side of Fulham Road, Chelsea, to abut also upon College Street and Kimbolton Row, on the application of Elms & Jupp, on behalf of E. Bingham and T. Crapper & Co., Ltd. (*Refusal.*)

Projecting steps and balconies in front of St. Clement's Parish Room, Fulham Palace Road, Fulham, on the application of E. Monson & Sons. (*Refusal.*)

Advertisement board in front of the Greenwich Central Hall, London Street, Greenwich, on the application of G. G. Woodward, on behalf of the Rev. W. Spencer. (*Refusal.*)

Houses on the northern side of Fane Street, North End Road, Fulham, on the application of J. T. Brown, on behalf of W. Huxley. (*Refusal.*)

Retention of an iron and glass shelter in front of the Arlington Street entrance to the Ritz Hotel, Piccadilly, on the further application of J. P. Bishop, on behalf of the Building and Vendor Co., Ltd. (*Consent.*)

One-storey addition at the rear of the Plough public-house, No. 66, Coldharbour Lane, Brixton, at less than the prescribed distance from the centre of the roadway of Denmark Road, on the application of F. J. Eedle & Meyers, on behalf of C. Martin. (*Consent.*)

Retention of a wood and iron porch at Netherleigh, Manor Road, Forest Hill, abutting upon Piercefield Avenue, on the application of F. Penfold. (*Refusal.*)

Buildings on the site of No. 68, Spelman Street and Nos. 76, 78 and 80, Pelham Street, Whitechapel, on the application of J. R. Moore Smith, on behalf of J. Donn. (*Consent.*)

Building upon a site abutting on Blythe Road and Addison Gardens, West Kensington, on the application of Colonel E. Clarke, on behalf of F. Smiths. (*Consent.*)

Modification of the provisions of that section with regard to open spaces about buildings so far as relates to the proposed erection of a building on the south-west side of Camberwell New Road, Camberwell, adjoining the Athenæum public-house, with an irregular open space at the rear, on the application of Barlow, Roberts & Thompson. (*Consent.*)

Iron and glass covered way in front of block B, The Pryors, East Heath Road, Hampstead, on the application of J. E. Yerbury. (*Refusal.*)

Buildings on the north-eastern side of Maida Vale, St. Marylebone, on the application of V. S. Galsworthy, on behalf of the trustees of Harrow School. (*Refusal.*)

One-storey building at the Stepney Jewish School, Stepney Green, on the application of Joseph & Smithem. (*Refusal.*)

Building on the eastern side of Gwendolen Avenue, Putney, adjoining the Putney Wesleyan Church, on the application of Thomson & Pomeroy, on behalf of the trustees of the Putney Wesleyan Church. (*Refusal.*)

Retention of a roof over a yard at Potter & Clark's premises, Artillery Lane, Whitechapel, to abut upon Bell Lane, on the application of H. Line, on behalf of Potter & Clarke. (*Consent.*)

Modification of the provisions of that section with regard to open spaces about buildings so far as relates to a building on the north-eastern side of Lifford Road, Camberwell, with an irregular open space at the rear, on the application of E. E. Bird, on behalf of L. Whitehead & Co., Ltd. (*Consent.*)

Modification of the provisions of that section with regard to open spaces about buildings so far as relates to two buildings erected on the southern side of Battersea Rise, westward of No. 89, with irregular open spaces at the rear, on the application of H. Bignold. (*Consent.*)

Deviation from the plan sanctioned on November 19th, 1869, for the formation of a new street to lead out of the south side of Sydenham Road, Lewisham, so far as relates to an alteration in the position of the boundary at the north-eastern corner of the street, on the application of R. Appleby. (*Consent.*)

Deviations from the plans approved by the Council on January 31st, 1905 and August 1st, 1905, for the formation of new streets on the St. Quintin estate, St. Quintin Avenue, so far as relates to a slight deviation in the direction of street No. 1 (Highlever Road) and in the position of the boundaries of street No. 4, on the application of Trant, Brown & Humphreys. (*Consent.*)

Deviations from the plans approved on January 21st, 1902, and May 13th, 1902, under the provisions of section 76 of the London Building Act, 1894, in connection with block 2 of a factory building on a site on the west side of Tyssen Street, Dalston Lane, Hackney, such deviations being shown on the plans, dated March 1st, 1906, and April 14th, 1905, submitted in connection with the application of T. B. Whinney, on behalf of the Marconi Wireless Telegraph Co. (*Consent.*)

Plans, as amended, dated March 16th, 1906, and April 4th, 1906, submitted with the application of C. Thompson, on behalf of the County of London Electric Supply Co., Ltd., for the construction of a new roof over the switch-room at the company's generating station, The Causeway, Wandsworth. (*Consent.*)

Deviation from the plans approved on November 15th, 1904, for the erection of dwelling-houses, to be inhabited by persons of the working-class, on a site to the northward of the Rotherhithe Tunnel approach, between Rose Lane and Butcher's Row, so far as relates to an alteration in the setting-out of certain of the blocks, on the application of R. Robertson, on behalf of the Housing of the Working Classes Committee of the Council. (*Consent.*)

Conversion of No. 158, Farringdon Road, Finsbury, into a warehouse and stables without complying with the provisions of section 41 of the said Act, on the application of J. B. Pinchbeck, on behalf of J. May. (*Consent.*)

Addition to No. 13, Highgate Hill, Highgate, without the provisions of section 74 of the said Act being complied with, on the application of C. W. Callcott, on behalf of J. W. Galton. (*Refusal.*)

The Theatre and Music Hall Committee also reported the following:—

Drawings submitted by W. G. R. Sprague showing certain slight modifications proposed to be made in the grand saloon, balcony and balcony saloon at the new theatre to be erected at the corner of Shaftesbury Avenue and Rupert Street. (*Consent.*)

Enquiries Answered.

The querist's name and address must always be given, not necessarily for publication.

Preservative for Marble.

SUNDERLAND.—MASON writes: "Is there any preparation made for the purpose of preserving marble tombstones, &c., from the action of the weather?"

We suggest the use of any of the well-known colourless stone preservatives.

Building Line.

TAUNTON.—BUILDING LINE writes: "A and B are two old dwelling-houses and C is, and has been for years, a garden. B and C belong to the same owner, who wishes to come out to a building line marked $\times-\times$, but the authorities wish him to keep back to a proposed new building line. Can they compel the owner to set back? Sketch sent (not reproduced)."

In my opinion the authorities are exceeding their powers in this case. The correct building line is found by drawing a line from the front main wall of building A to the front main wall of building B, and it appears to me that the line you mark "owner's building line" is therefore the correct one. This by section 3 of the Public Health Act of 1888. F. S. I.

Size of Stanchions for Shop Front.

STRESS writes: "In altering a shop front it is proposed to support the girder solely by stanchions. These are to be 14ft. high, and the total load bearing on each is 46 tons.

Supplement to
THE BUILDERS' JOURNAL AND ARCHITECTURAL RECORD,
Wednesday, May 9th, 1906.

NEW CHURCH AT BOURNEMOUTH. G. GILBERT SCOTT, ARCHITECT.
(*Royal Academy Exhibition, 1906.*)

STUDY FOR A MODERN CHURCH. HUBERT C. CORLETTE, F.R.I.B.A., ARCHITECT.
(Royal Academy Exhibition, 1906.)

Notes and News.

A new Public Library at Blackpool is to be erected at a cost of £15,000.

The Derby Master-builders' Association held their annual dinner recently under the presidency of Mr. R. Weston.

A new Operating Theatre is being erected at the Royal Portsmouth, Portsea and Gosport Hospital. The architects are Messrs. Young & Hall, of London.

Mr. W. H. D. Caple, architect, of Cardiff, has been appointed by the magistrates of the city of Cardiff to assess the amount of compensation to be paid under the Licensing Act, 1904, for surrendered licences.

Scottish Building Trades Federation.—At the recent half-yearly meeting at Edinburgh Mr. James Leslie, of the Aberdeen Association, was appointed vice-president. The annual meeting was fixed to be held at Edinburgh in September.

A new Grammar School at Farnham, Surrey, has been built at a cost of £13,000 from designs by Messrs. Jarvis & Richards, of London, architects to the Surrey Education Committee. Messrs. Crosby & Co., of Farnham, were the builders. The school is of red bricks and has tiled roofs.

Messrs. Norton & Gregory, Ltd., the well-known photo-lithographers and drawing-office stationers, of Castle Lane, Buckingham Gate, S.W., announce that the business hitherto carried on by Mr. H. G. Carpmal as managing partner of Messrs. Allott, Jones & Notley, of Westminster, has been amalgamated with their own, and that Mr. Carpmal has joined the board of directors.

Exaggerated Rumours about Exeter Cathedral have been circulated recently. There has been a crack in the southern face of the south tower for a long time, and the Dean and Chapter requested Mr. Harbottle, their architect, to make a thorough examination of the foundations. This work has been in hand for some time, but up to the present Mr. Harbottle has not come across anything which gives any ground for anxiety.

"The Parliamentary Gazette."—Messrs. Howarth & Co., of 20, Rhodesia Road, S.W., send us a copy of the April number of this little book, which gives a list of members and short records of each day's proceedings in the House. Two more numbers will be issued during the present session, one during the Whitsuntide recess (price 1s.) and the other dealing with the whole session complete, and considerably enlarged (price 2s.), in September. The price of the April number is 1s.

South Wales Architects: Annual Dinner.—The annual dinner of the Cardiff, South Wales and Monmouthshire Architects' Society was held on April 27th at Cardiff, the chair being occupied by the president (Mr. J. H. Phillips). The toast of "The Royal Institute of British Architects" was given by Mr. D. Morgan and responded to by Mr. Seward in the absence of Mr. Dare Bryan, of Bristol. Mr. Ernest Runtz (London) proposed the toast of the Society. He said he was strongly in favour of some measure of legislation if they were to keep their status and improve the condition of building in this country.

The Bill for the Proposed London County Hall has been ordered to be reported to the House for third reading. Messrs. Holloway Brothers, Ltd., objected to the proposed compulsory acquisition of the land of which they have a lease for an unexpired term of seventy years, urging that without their premises the Council had more than sufficient room. The actual design of the building has not yet been settled, but the superintending architect to the Council has submitted a covering estimate of £1,056,000. The total expenditure, with £55,000 for the embankment, will be £1,711,000.

The Northern Architectural Association has just issued its annual report for the past session.

The Nave of Thorney Abbey, which was being repaired, collapsed without warning recently.

New Schools at Altrincham have been built and furnished at a cost of £13,200. Accommodation is provided for about 800 children.

The Ruins of St. Botolph's Priory, Colchester, are in imminent danger of collapse. It is expected that the town council will make an effort to preserve them.

Aberdeen Joiners: Strike Averted.—The Aberdeen joiners decided last week, by 183 votes to 137, to go to arbitration in the dispute between themselves and the masters.

St. Wilfrid's Church, Harrogate, will have cost £30,000 when completed. It is in the Early English style, Mr. Temple Moore, of London, being the architect.

The London Central Markets are to be thoroughly examined, so far as their iron and steelwork is concerned, by Mr. A. T. Walmisley, who will receive a fee of 300 guineas.

A Carnegie Free Library at Aberystwyth has been completed at a cost of £3,000. The architect was Mr. W. G. Payton, of Birmingham, whose design was selected in competition. The building is of local rubble stone with Greenhill stone dressings.

The Birmingham City Surveyorship, rendered vacant by the death of the late Mr. John Price, has attracted a large number of applicants. It carries a salary of £1,250 per annum. The appointment will probably be made on June 12th.

A Conciliation Board in connection with the building trades has recently been formed in York between the York Master-builders' and Contractors' Association and the several operative societies of bricklayers, carpenters and joiners, and stonemasons.

R.I.B.A. Annual General Meeting.—The annual general meeting of the Royal Institute of British Architects was held at 9, Conduit Street, W., on Monday evening. The chief business was the consideration of the annual report (given on p. 236 of our issue for last week).

A new Process of Making Bricks has been introduced by Messrs. Eastwood & Co. at their works at Conyer, near Sittingbourne. Bricks of good quality are now turned out by machinery in seven days, against three months under the old handmade process.

A Central Reference Library at Stepney has been erected at a cost of £6,000. The building, which was designed by the borough engineer, Mr. M. W. Jameson, includes on the ground floor a lecture-hall and reading-room for juveniles. On the first floor is the reference room, 60ft. long.

Lead Statues: A Suggestion.—Writing in the May "Burlington" on "Some Lead Portrait Statues," Mr. Lawrence Weaver makes an interesting suggestion as to the use of lead in certain cases. One may admit (he says) the coarser treatment that lead demands, and the absence of finely-modelled sinew and vein that bronze makes possible. Still, some modern bronze effigies of successful generals could well be spared, if in exchange we could summon from the vasty deep of the plumber's pot some long-melted lead statues of the eighteenth century, like the "William III." at Dublin. No one would affirm that good lead was less good than bad bronze, and if sometimes, where money was strictly limited, a better artist and a cheaper material were employed instead of a feeble artist and a costly material, our public places would not be the losers.

St. Stephen's Church, Clapham, is to be extended by the addition of an aisle. The cost will be £1,600.

A new Post-office at Stoke Newington is to be erected as close as possible to the present postal buildings in Brooke Road.

A new Free Church Hall at Stepps is being erected at a cost of £1,000. Mr. J. Gillespie, of Messrs. Purdie & Gillespie, of Glasgow, is the architect.

The Projected Subways for New York are estimated to cost £90,000,000, of which £60,000,000 is to be expended in the work of construction and £30,000,000 in the service equipment. Nineteen subway routes have been approved by the Rapid Transit Commission.

Painters' Cradles: A Fatal Accident.—At the Hammersmith Coroner's Court last week an inquest was held on the body of a painter named Frederick Jones, aged 40, who died in hospital from injuries caused by a fall from Hyde Park Mansions. He was working on a cradle at the top of the building and dropped 90ft. on to a bush, just missing the iron railings. One rope of the cradle had become unfastened and he was tipped out. The jury returned a verdict of "Accidental death," adding that it was advisable some means should be adopted to make it impossible for the hooks on cradles to slip.

Habitations Hygiéniques Confortables à Bon Marché.—Even France cannot keep out American "pushfulness." We see an advertisement in the "Matin":—"Pour les construire ou pour diriger soi-même les travaux, recueil de plus de cent types de dessins de tous styles et de tous prix, avec leur distribution intérieure. Envoi franco, contre mandat de 6 fr. 50, de l'ouvrage complet ou prière d'indiquer le prix de la construction désirée et il sera envoyé une planche spécimen contre 1 fr. 50 adressé à l'Union Générale d'Architecture, 148, rue de Grenelle, Paris (7e), qui répondra gratis à toutes questions d'architecture et de construction."

Olympia now the Greatest Covered Stadium.—Now that the organizers of the Royal Naval and Military Tournament have decided to give their annual display at Olympia, Kensington, the interior of the huge building has been entirely remodelled. Seating accommodation has been provided for 10,000 people, and it is claimed that it is the most colossal stadium to be found in any covered building in the world. It is constructed of steel trestles with timber platforms 2ft. 9ins. wide on the ground floor, with a rise of 12ins. from step to step, and 2ft. 6ins. wide on the gallery floor, with a rise of 1ft. 6ins. Upon these platforms chairs securely fastened are arranged in blocks. The New Olympia Co. have carried out these alterations at a cost of more than £10,000. The re-modelled building was first used for the wrestling match between Hackenschmidt and Madrali.

Addition to the Temple Library.—The important addition to the library of the Middle Temple, which has been in hand since last September, is nearing completion. The work has been carried out in Portland stone on Gothic lines, in keeping with the main structure, which was designed by Savage and opened by the King when Prince of Wales in 1861. On the entrance level is a new porch, with an inside screen of carved oak. The former entrance to the library from the top of the stairs has been blocked up and a new doorway under the large central window has been formed. Special rooms have been provided on this floor for the librarian and for Parliamentary papers, thus enabling two additional bays for reading to be formed in the library on the ground hitherto occupied. Messrs. Higgs & Hill are executing the alterations, under the supervision of Mr. H. J. Wadling, architect to the Middle Temple.

The new Victoria Station, where work has been in progress for three years, is to be formally opened for traffic on June 1st.

Sir Charles Holroyd, for many years Keeper of the Tate Gallery, has been appointed director of the National Gallery, in succession to Sir Edward Poynter.

York Architectural Society.—At the annual meeting held last Thursday Mr. Arthur Pollard, F.R.I.B.A., was elected president for the current session, Messrs. S. Needham and A. A. Gibson vice-presidents, and Messrs. W. E. Barry, A.R.I.B.A., T. W. Whipp, A.R.I.B.A., J. H. Rutherford, E. A. Pollard and A. Cowman elective members of council.

Springburn District Library, the eleventh to be completed under the Glasgow Corporation library scheme, was formally opened last week. The building is situated in Ayr Street and Vulcan Street, and provides room in the lending department for about 10,000 volumes. The general reading-room accommodates 80 persons, the ladies' room 34, and the boys' and girls' room 100 boys and 50 girls. The architect was Mr. W. B. Whitie, of Glasgow.

THE COLISEUM.

What Mr. Stoll said about the Architect.

AT the meeting of the shareholders in the London Coliseum, Ltd., held at Cardiff last Thursday Mr. Oswald Stoll (the chairman) made some statements about the architect (Mr. Frank Matcham) and the engineer of the new building in St. Martin's Lane which it is as well to give in full, as the abbreviated reports which have appeared are apt to be misleading. Mr. Stoll said: "Quite apart from the amount estimated in the prospectus, or numerous other amounts that, when carefully examined by the auditors, rightly came under this head, the architect's estimate in the prospectus having been exceeded by the architect and engineers by £67,000—that is 67 per cent.—is the main cause of our trouble. If we wanted £67,000 less to-day we should not have been in this position, and the proper conduct of the business throughout the year would not have been interfered with in the way it must necessarily have been, where Mr. Matcham had to rely upon the estimate of the engineer, which was also greatly exceeded. Mr. Matcham is not to blame. The only consolation we have is that the value for the money is there, in probably one of the finest theatrical buildings in the world. The directors were obliged to rely upon their experts in this expenditure, and the past experience of Mr. Matcham justified them in doing so. In my own mind I believe his long and painful illness was responsible for his miscalculations, owing to the piecemeal way in which he had to do the work—moreover, varying requirements of the London County Council necessitated expenditure which he did not contemplate. But as to the directors approving of the excess of expenditure, instructions to the solicitors and letters they wrote on the subject are on record to disprove that, and these were written at the time when it was thought his part of the work would cost only £15,000—not £50,000—more. I have no wish to depreciate Mr. Matcham, who is both an able architect and an honourable man. I should not hesitate to employ him again in such a concern, as he is at least equal to any other man who could be found; but every contract would have to be actually settled before a brick was laid. It is said that such a course, however desirable, is impossible from a practicable point of view in a concern of the magnitude of the Coliseum."

THE REGISTRATION BILL.

American Opinion.

AS our readers know, it is our custom, whenever occasion arises, to give outside opinions on various matters affecting the profession, and, following that practice, we have many times quoted American opinion on subjects dealt with by architects in this country. The latest occasion for this we find in the "American Architect" for April 14th, where extended notice is given to the Enrolment Bill of the R.I.B.A. Our contemporary says: "The manner in which the matter of registration of architects in England is being handled just now is in refreshing contrast with the wire-pulling methods followed in this country by the supporters of the architects' licence movement. The Royal Institute of British Architects, long opposed to the idea, was, last year, reluctantly brought to a point where it gave the proposal a qualified endorsement and undertook to give the matter considerate attention during the past winter, appointing a committee to investigate and report. This committee, in turn, placed the matter in the hands of a sub-committee, equally divided, as was the larger one, between those who favoured and those who opposed the plan, and this sub-committee then selected and invited to appear and give testimony before it twenty-four architects, twelve favouring and twelve opposing the plan, and, also, in equal numbers representing the metropolis and the provinces. These twenty-four gentlemen attended and set forth their ideas and opinions at twelve successive meetings. The sub-committee then conferred and reported to the larger committee, which in turn considered and reported to the Institute itself at a general meeting on April 3rd."

Proper Methods and Fraudulent Ones.

"That appears to us to be a proper and dignified manner of treating a vexed subject which deserves calm and considerate, not impassioned nor hysterical, discussion. It is grossly improper and unfair for a small group, or coterie, or society, to vote, possibly at a packed meeting, to support a license measure and thereupon hasten to the legislature with a crude and ill-considered bill which they seek to jam through as hastily and quietly as possible. If the measure be good and worthy, or if it be evil and obnoxious, it, in either case, affects the entire body of the profession, and when the demand comes from within it should be the voice of the majority of those who are to be affected that the lawmakers should listen to. If it comes from without, from the great general public seeking to defend itself, why then the profession, as the weaker of the two interested but opposing parties, must yield. So far as this country is concerned, we are convinced that the demand for a license law, so far as it comes from within the profession, is not a genuine, and certainly not a general, demand. We believe it is nothing more nor less than a hasty and ill-considered giving way to the great American peculiarity, the itch for formulating a new law without taking time to consider whether older laws do not already cover the point."

"In the case of architects, we believe that Existing Laws do Sufficiently Cover the Requirements."

since architects are common and not uncommon human beings, and, on the average, are desirable and law-abiding citizens. If the great public feels that the architect is more dangerous to its welfare than the merchant, the broker, the engineer or the mechanic, then it is proper to put him under a restraint that these others are not affected by. But we do not for a moment believe that the public feels in this way about the members of the architectural societies, the graduates of the architectural schools, and

the many men of merely practical training who, in years of faithful service, have proved their competence, and we do not believe the public feels there would be any justice in requiring these men, even if they can well afford it, to pay an annual license-fee, when the merchant, the broker, the engineer and the mechanic are allowed to follow their calling untaxed, or that there is any good reason for placing such a stigma on honourable men. The public can proceed against an unlicensed architect for manslaughter as successfully as against a licensed one, and an injured client can as hopefully expect to collect civil damages." How then is the public benefited by annoying the majority of architects?

The Evil of Licence Law.

"Our own belief is, that the evil done by those who can now practise as architects, but who would be barred from practice through the operation of a license-law, is really a negligible quantity, so far as public safety is concerned. The practitioner of blunted moral faculties, who, for gain, becomes the willing tool of real-estate speculators, may be able to pass with flying colours the severest examination that can be devised. How does a license protect the public from such a man? For such real evil as there is—and so far as the public is concerned, it is infinitesimally small—we believe that a cure should be found, not through special and obnoxious 'class legislation'—which may or may not prove to be unconstitutional, for the constitutions of the several States are by no means identical in their provisions—but simply through enforcing against the small body of malpractitioners the penalties already established by the general laws. Architects are not outlaws; they constitute a highly developed and liberally educated profession, and they should be considered and treated as other professional men are. The profession is coherent and respected: it would gladly feel itself self-respecting, if the champions of the license system would kindly allow it that privilege. If, perchance, its manners, morals and customs need amending or cleansing it should be allowed, encouraged, or, if need be, compelled to itself attend to such cleansing."

A Western View of the Architect's Licence.

A writer in "The Architect and Engineer of California" says: "The City Council of Oakland has passed an ordinance which levies a tax on almost all kinds of animals, including architects. The tax or license on a dog, which latter is allowed to run at large, is fixed at a less sum than the tax on architects, probably because it was thought that the dog is a more harmless creature. The tax on a stallion or a bull is about the same as that demanded from the poor dumb beast who daily bends his back over a drawing-board creating 'frozen music' and other Ruskinisms. Incidentally, many commercial pursuits were also taxed, but no other profession was included."

"The patriarchal fathers, when interviewed, informed a committee of architects that no tax had been levied on doctors or lawyers or dentists because they were governed by a State law which regulated the practice of their profession, and seemed very much surprised to know that the architectural profession was similarly controlled, but they could not revoke what they had decreed, and the law must stand. They, however, gave the committee to understand that the carpenter-architect, to whom the drawing of plans was incidental to his business, and to whom it was not an exclusive method of earning a livelihood, would not be considered as taxable. It is said that the councilmen contemplate adding an amendment to the law requiring that architects wear a leather muzzle during the hot months."

BUILDING BY-LAWS.

Alteration to the Bill in Committee.

ON May 1st the Standing Committee of the House of Lords met to consider the Public Health Acts Amendment Bill, the title of which was altered to the Public Health (Building By-laws) Bill. Important amendments were submitted by Lord Carrington, President of the Board of Agriculture, and, with one exception, were agreed to. In the first place, clause 2, exempting certain buildings from the operation of certain building by-laws, was limited to rural districts. The by-laws in question, as they stood in the Bill originally, were those regarding structure of walls, foundations, roofs, floors, chimneys or hearths, or the sufficiency of space to be provided about buildings, or the ventilation of buildings, on the deposit of plans and sections concerning these matters. The ventilation of buildings was struck out from the list, and "the space to be provided about buildings" was altered to "the space to be provided in front of buildings." The exempted buildings in the original clause were those sufficiently isolated, with the exception of public buildings or factories. These exceptions from exemption were extended to include workshops or workplaces.

A New Sub-section

was added to the clause to the following effect:—

Nothing in this Act shall exempt a building from the operation of any by-law so far as that by-law relates to purposes of health, and if any question arises under this provision whether a by-law relates to purposes of health or not, that question shall be decided by the Local Government Board, and their decision shall be conclusive.

Clauses 4, 5 and 6 were struck out of the Bill. These clauses had reference to wholesome sites and the construction of exempted buildings, to the prohibition of the occupation of buildings erected contrary to the provisions of section 4, and to the disallowance of by-laws and substitution of others by the Local Government Board.

Extension to Urban Districts.

A new clause was inserted giving the Local Government Board power to extend by order the provisions of the measure to urban areas, on the application of the local authority, or of ratepayers representing at least one-tenth of the ratable value of the area. The order might be revoked on a similar application. Clause 7 prescribed procedure for persons aggrieved by a local authority's by-law or refusal to approve plans submitted in pursuance of a by-law, and authorised application to a court of summary jurisdiction for an order requiring the local authority to dispense with a requirement or to approve a plan with or without such modifications as the court should think fit. This clause was amended so as to provide that the order of the court should in itself dispense with the requirement or approve the plan or a modification of it, an appeal being left, as in the original clause, to quarter sessions. Sub-sections were added to the clause providing that the dispensing order must state that the court is satisfied that the requirement may be dispensed with without prejudice to the public health, and without unduly impairing the stability of the building to which the dispensation relates, or the security from fire of that building and any adjoining building.

The amendment which Lord Carrington

agreed to withdraw at the request of Lord Hylton was proposed in sub-section (4) of clause 2, which defines the exempted buildings. The sub-section set forth that two dwelling-houses separated by a party division of fire-resisting material should for the purposes of the Act be deemed to be a single building. Lord Carrington having procured the substitution for "party division of fire-resisting material" of the words "party-wall of brick or stone or other incombustible material," proposed to add "not less than gins. in thickness." Lord Hylton urged that these words were not required, and they were not insisted upon.

The Bill, as amended, was ordered to be reported to the House, and the Committee adjourned.—"Times."

BOURNVILLE'S NEW SCHOOLS.

NEW elementary schools at Bournville, outside Birmingham, built at

"No Bill would be otherwise than disastrous to architecture considered as a profession only, to say nothing of architecture in its highest sense as a fine art."—ANTI-REGISTRATIONIST.

a cost of £30,000 by Mr. and Mrs. George Cadbury, have been opened. They consist of schools for 540 boys and girls; an infants' department is to be added later. A feature of the design is the reduction in the size of the classrooms as compared with past ideas, thus making for greater efficiency in teaching and improvement in hygienic conditions. This innovation was approved by the Education Department. The change cost the founders £600 more when compared with the cost of schools of the orthodox-sized classrooms. The schools are built on the central-hall plan, with twelve classrooms around. They are situate upon sloping ground in the centre of the village, and are dignified by a massive square tower, in which a carillon, consisting of twenty-two bells, is set. A fall in the land renders a basement necessary, and in this are placed technical arts and handicrafts rooms for the use of boys, and laundry and cookery rooms for the use of the girls. In the tower there is a library.

Law Cases.

Architect's Decision as Arbitrator upheld.

—At the Carnarvon County Court last week a case was heard in which Messrs. David Jones & Sons, builders, of Rhostryfan, claimed £48 from the trustees of a new chapel erected at Rhosgadfan. The work was carried out according to the plans and specifications of Mr. R. L. Jones, architect, of Carnarvon, at a cost of £1,150. There were general conditions attached to the contract, and one of the clauses provided that any dispute arising out of the contract should be referred to the architect, whose decision was to be final. The case for the trustees was stated to be that the architect, after allowing the builders for all reasonable time, declared them still liable for £100, but after consultation with the committee the amount was reduced to £48. Mr. R. L. Jones, the architect, said that the delay was due to plaintiffs' negligence, and he considered he had treated them most liberally. His Honour held that the case of *Dodd v. Churton* did not apply. The parties had elected to make the architect the arbiter, and he would not interfere with his decision. Judgment for defendants, with costs.

Drain Testing.—Mr. Charles Phillips, of Crouch End, once a building inspector in the employment of the Hornsey Borough Council, but now a builder on his own account, was summoned at Highgate recently for obstructing the local authority's surveyor and building inspector and refusing to allow them free access to a new house for the purpose of finally testing the drains before they were covered in.—The Bench convicted on both summonses, and fined Phillips £2 and £5 5s. costs and the Court costs on each, making a total of £15 6s.

"An Indivisible Area."—The Court of Appeal recently heard the case of *Hooper & Ashby v. Willis*. The appellants are a firm of builders' merchants at Southampton, with branch offices at Bournemouth, Poole, Branksome, Portsmouth and Guildford. The defendant entered their service in 1896, aged 19, and the agreement then made between them stated that defendant would not for a space of fourteen years after the termination of his employment carry on business as a builders' merchant, &c., at any place within thirty miles of either the town hall at Bournemouth or the Bargate at Southampton. The defendant remained in the employment of the appellants until August, 1903, when he discharged himself. He had since, appellants alleged, broken his agreement by carrying on business as a builders' merchant at Broadstone, which was within seven miles of the town hall of Bournemouth. Messrs. Hooper & Ashby accordingly commenced this action for an injunction to restrain him from continuing such business at Broadstone. Mr. Justice Kekewich, in the lower Court, was of opinion that the area within which the defendant was prohibited from carrying on business was larger than was reasonably required for the protection of the appellants' trade, and on that ground dismissed the action with costs. Appellants appealed. Their Lordships dismissed the appeal, taking the same view as the learned judge in the Court below, and holding that the area contemplated was larger than was reasonably necessary.

Complete List of Contracts Open.

With a few exceptions, news of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issue of other contracts that still remain open.

Unless expressly stated to the contrary all deposits required for bills of quantities, &c., are returned on receipt of *bona-fide* tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair-wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

May 10. Leith.—*Laying a granolithic floor in sheds at Albert Dock, Leith.* Specification, form of tender, and other particulars may be obtained on application at the office of Peter Whyte, M.I.C.E., superintendent of the harbour and docks, Tower Place, Leith. Tenders are to be delivered to Victor A. Noel Paton, clerk to the commission, 31, Melville Street, Edinburgh, on or before May 10.

May 10. Newcastle-upon-Tyne.—*Erection of a new police-station at Walker.* Contractors desirous of tendering are requested to send in their names to the City Property Surveyor, Town Hall, Newcastle, on or before May 10.

May 10. Royton.—*New public elementary school at Byron Street, Royton, near Oldham.* The plans may be seen and bills of quantities obtained at the office of the county architect, Henry Littler, 16, Ribblesdale Place, Preston, by payment of a deposit of £2. Tenders must be delivered before noon on May 10, sealed and endorsed, to J. W. Riley, Town Hall, Royton.

May 10. Newby.—*Enlargement of Newby Chapel.* Plans and specifications may be seen at Townhead, Newby, and estimates, sealed and endorsed, to be returned to Richard Green, Newby, by May 10.

May 10. Edderton.—*Mason, carpenter, slater, plumber, lath and plaster and galvanized corrugated iron works of rebuilding Lidstone Lodge, Edderton.* Plans and specifications can be seen with A. Matland & Sons, architects, Tain, and offers can be lodged with them on or before May 10.

May 10. Warrington.—*Erection of a mission church, at Werrington, for the Rev. H. M. Fowler.* Builders should send in their names to R. Scrivener & Sons, architects, &c., Hanley, by May 10. Bills of quantities will be supplied.

May 10. Antrim.—*Erection of labourers' cottages in the rural district, in accordance with plans and specifications, which can be seen at the office of the Clerk of the Council, or at the office of the architect, W. D. R. Taggart, Scottish Provident Buildings, Belfast, as follows: One cottage at Ballyearl, Carnmoney, on the lands of Mr. W. Houston; one cottage at Killyfad, Randalstown, on the lands of John Fulton; one cottage at Annaghmore, Toomebridge, on the lands of B. O'Boyle; one cottage at Portlee, Toomebridge, on the lands of Mrs. McCann; one cottage at Portlee, Toomebridge, on the lands of John O'Boyle; two cottages at Ballynamullen, Toomebridge, on the lands of Felix Lavery; one cottage at Tamnaderry, Randalstown, on the lands of James Gilbert; four cottages at Cranfield, Randalstown, on the lands of James Charleton; two cottages at Cranfield, Randalstown, on the lands of Bernard O'Kane; one cottage at Cranfield, Randalstown, on the lands of Mrs. Hume; two cottages at Feehogue, Randalstown, on the lands of Lord O'Neill; four cottages at Lurgan West, Randalstown, on the lands of Lord O'Neill; one cottage at Ballygrooby, Kandalstown, on the lands of G. L. Young; two cottages at Craigmore, Randalstown, on the lands of J. H. Mulligan; two cottages at Ballymacilhoyle, Crumlin, on the lands of W. S. Thompson. Persons tendering may do so for any or all of the different blocks; but they must name the particular site or sites on their tender. Tenders are to be lodged with J. Clark, clerk of Council, Union Office, Antrim, not later than 10 a.m. on May 10.*

May 11. Aberbargoed.—*Additions and alterations to Caersalem Baptist Chapel at Aberbargoed in accordance with plans and specification prepared by James & Morgan, F.R.I.B.A., architects, Cardiff.* Plans and specification may be seen and further particulars obtained, either at the Architects' Office or at the Rev. D. F. Walters, Frondeg, Aberbargoed. Sealed and endorsed tenders to be sent to the Rev. D. F. Walters not later than May 11.

May 11. Abernant.—*Rebuilding Bethesda Welsh Independent Chapel, Abernant, Aberdare, for the Trustees.* Plans and specification can be seen at the office of T. Roderick, architect, Ashbrook House, Clifton Street, Aberdare. Endorsed tenders to be sent to J. Barclay, 10, Windsor Terrace, Abernant, not later than May 11.

May 11. Taunton.—*Erection of a new classroom wing and corridors, and also a new corridor to connect this extension with the new chapel, at Taunton school.* The plans and specifications may be seen and bills of quantities obtained at the offices of F. W. Roberts, M.S.A., architect and surveyor, 2, Hammet Street, Taunton, to whom tenders must be delivered by the first post on May 11.

May 11. Souterfell.—*Erection of new farm buildings at Souterfell, near Troutbeck, for John Bellas.* Plans and specifications can be seen at the office of W. Hall, Troutbeck, who will receive tenders, endorsed "Farm Buildings," up to May 11.

May 11. Sunderland.—*Alterations and additions to the men's bathroom in the main building at the Workhouse, Hylton Road, Sunderland, in accordance with the plan and specification to be seen on application to W. & T. R. Milburn, architects, 20, Fawcett Street, Sunderland.* Tenders, endorsed "Alterations and Additions to Bathroom," must be delivered to Robert Thompson, clerk to the Guardians, Union Offices, 17, John Street, Sunderland, before noon on May 11.

May 12. Redruth.—*Erection of banking premises at Penryn Street, Redruth, and shop premises adjoining same, for Barclay & Co., Ltd.* The drawings and specifications may be seen by appointment at the offices of the architect, C. Caldwell, Victoria Square, Penzance, to whom sealed tenders, endorsed "Tender for Banks," are to be sent by May 12.

May 12. Belfast.—*Erection of a new block of buildings, comprising shops and offices, at Arthur Street-Arthur Square and William Street South, Belfast.* Bills of quantities may be obtained from T. C. Hunter, Scottish Provident Buildings, on payment of a deposit of £2 2s. Plans and specification may be seen at the office of Blackwood & Jury, architects, 41, Donegall Place, Belfast, to whom sealed and endorsed tenders are to be sent on or before 10 a.m. on May 12.

May 12. Laugharne.—*Restoring Cliff House, Laugharne.* Plans and specification to be seen at Cliff House. Tenders to be sent to W. H. Dempster, Cliff House, Laugharne, on or before May 12, endorsed "Tender for Cliff House."

May 12. Newport.—*Building additions to Sirhowy and Argoed infants' council school, and carrying out repairs and improvements to Lower Rhymney and Middle Rhymney infants' council schools.* Plans and specifications may be seen either at the office of David Morgan (Messrs. James & Morgan, F.R.I.B.A.), architect, Charles Street Chambers, Cardiff, or at the office of C. Dauncey, Park Chambers, Tredegar. Quantities supplied for Sirhowy and Argoed schools. Separate sealed tenders, in separate envelopes for each school, endorse 1 respectively "Sirhowy School Tender," &c., to be delivered to C. Dauncey, County Council Offices, Newport, Mon., not later than, in the case of the Rhymney schools, May 12, and in the case of the Sirhowy and Argoed schools, May 15.

May 14. Alford.—*Building a church hall at Alford, Lincolnshire.* Plans and specifications may be seen at Mr. Green's, chemist, Market Place, Alford, by appointment. Tenders must be received on or before May 14.

May 14. Marlpool.—*Council school to accommodate about 216 boys.* Persons desirous of tendering for the work may see the drawings, specification, agreement, &c., at the office of the Architect to the Committee, St. Mary's Gate, Derby, between 10 a.m. and 4 p.m., except on Saturday, when they will be on view from 10 a.m. to 12 noon. A copy of the bill of quantities, specification, conditions of contract and form of tender can be obtained at the Architect's Office upon payment of £1 1s. Sealed tenders, in envelopes provided for the purpose, endorsed "Tender for New Council School, Marlpool," must be delivered to George H. Widdows, A.R.I.B.A., architect to the Committee, County Education Offices, St. Mary's Gate, Derby, not later than 5 p.m. on May 14.

May 14. Dublin.—*Erection of an electricity sub-station at Fairview, Dublin, in accordance with plans and specifications, and conditions of contract prepared by the city architect, which may be inspected daily (except on Saturdays) at his office, Municipal Buildings, Cork Hill, Dublin, between 11 and 4.* No tender will be entertained which is not on the prescribed form. Copies of bills of quantities and forms of tender may be obtained at the office of the City Treasurer, Municipal Buildings, Cork Hill, Dublin, on payment of £2. Tenders under seal, addressed to the "Chairman, Electric Lighting Committee," and endorsed "Tender for Electricity Sub-station, Fairview," to be lodged at the Electric Lighting Committee's office, 3, Cork Hill, Dublin, not later than 4 p.m. on May 14.

May 14. Nantyffyllon.—*New English Calvinistic Methodist Church at Nantyffyllon, near Maesteg.* Plans and specification may be seen and quantities obtained at the offices of Arthur Lloyd Thomas, A.M.I.M.E., architect and engineer, Church Street Chambers, Nantypridd. Sealed and endorsed tenders to be sent to D. E. Watkins, 24, Humphrey Street, Nantyffyllon, on or before May 14.

May 14. St. Austell.—*Erection of a residence at Truro Road, St. Austell, for E. Stocker.* Drawings and specifications may be seen at the office of the architect, B. C. Andrew, M.S.A., Biddick's Court, St. Austell, by whom sealed tenders will be received not later than noon on May 14.

May 14. Goldthorpe.—*Church.* Contractors desirous of tendering for the several trades required in the erection of a church at Goldthorpe, near Rotherham, are requested to send their names, along with a deposit of £1 1s., to Empsall & Clarkson, architects and surveyors, 7, Exchange Bradford, on or before May 14.

May 15. Sheffield.—*Erection of tenements on section 2 of the Crofts area.* Tenders for work required in connection with the above:—Excavator, bricklayer and mason, carpenter and joiner, slater, plasterer, plumber and glazier and painter. Specifications and plans may be seen and quantities obtained at the office of Charles F. Wike, C.E., city surveyor, Town Hall, Sheffield, on payment of £1 1s. Tenders, endorsed "Crofts Dwellings," are to be sent in not later than 9 a.m. on May 15, addressed to "The Chairman and Members of the Health Committee, City Surveyor's Office, Town Hall, Sheffield." Fair wages clause.

May 15. Fulneck.—*Erection of new laboratory block in connection with the boys' school at Fulneck.* The drawings, &c., may be seen, and quantities obtained from G. S. Nelson, architect, Sun Buildings, 15, Park Row,

Leeds, to whom tenders must be sent on or before 10 a.m. on May 15.

May 15. Wellington.—*School.* Builders willing to tender for Sunday school for the Primitive Methodist Trustees at Tan Bank, Wellington, Salop, must send their names and addresses to Elijah Jones, M.S.A., architect, 10, Albion Street, Hanley, Staffs. Quantities may be obtained up to May 10. Tenders to be in on May 15.

May 15. Patterdale.—*Alterations to St. Patrick's Church, Patterdale.* Plans, specifications and all particulars may be obtained on application to George Wason & Son, architects, St. Andrew's Chambers, Penrith. Tenders to be sent to the Rev. W. P. Morris, the Rectory, Patterdale, not later than May 15, endorsed "Tender for Church."

May 16. Epping.—*Construction of nurses' and infants' quarters at the Epping Workhouse.* Drawings can be seen and further particulars and bills of quantities obtained at the office of H. Tooley, A.R., A.B.A., Buckhurst Hill, upon a deposit of £1 1s. Applications for quantities must be made to H. Tooley before May 4. Tenders to be made on forms which will be supplied, and to be sent in the envelopes which will be provided, to R. D. Trotter, clerk to the Guardians, Epping, on or before 5 p.m. on May 16.

May 16. Uttoxeter.—*New Council school to accommodate about 532 children.* Builders desiring to tender for the work should apply to Graham Balfour, Director of Education, Stafford. Quantities will be supplied, for which a deposit of £1 1s. will be charged. The drawings and specification can be seen at the office of the Education Committee at Stafford.

May 16. Aberdeen.—*Mason, carpenter, glazier, slater, plumber, plaster, heating and iron works of alterations and additions at the north-east portion of the main buildings of the Royal Asylum.* The plans and conditions of contract may be seen with, and specifications and schedules of quantities obtained from, Kelly & Nicol, architects, 367, Union Street, Aberdeen. Sealed tenders are to be lodged with A. Scott Finnie, clerk and treasurer, 343, Union Street, Aberdeen, not later than May 16.

May 16. Guildford.—*Erection of eighteen cottages in Cline Road, Guildford, Surrey, in accordance with plans and specifications prepared by C. G. Mason, borough engineer, and T. J. Capp, architect, Stoke Road, Guildford.* Any person desirous of tendering must send in his name to the Town Clerk, accompanied with a deposit of £2, not later than May 16. Tenders, to be endorsed "Tenders for Workmen's Dwellings," to be sent in on a date which will be duly advised.

May 16. Glasgow.—*Mason and other works connected with alterations to be made on the tenement at the corner of Castle Street and St. James' Road belonging to the Corporation.* The plans may be seen, and copies of the specification, schedule of quantities and form of tender obtained, upon application at the office of the City Engineer, 64, Cochrane Street. Tenders, marked "City Improvements Department—Tenement, Castle Street and St. James' Road; Tender for Alterations," to be lodged with A. W. Myles, town clerk, City Chambers, Glasgow, on or before May 16.

May 16. Rhymney.—*Alterations and general renovation of Brynhytyrd C.M. Chapel, Rhymney.* Plans and specifications to be seen with B. Jones, 29, Plantation Street, Rhymney, to whom tenders are to be delivered on or before May 16. Sealed and endorsed "Tender for Chapel."

May 16. Lower Boswarva.—*Erection of farm buildings at Lower Boswarva, for T. R. Bolitho.* The drawings and specifications may be seen at the offices of Henry White, F.R.I.B.A., Keigwion, Hemaor, R.S.O., to whom tenders, endorsed, should be delivered not later than May 16.

May 16. Hull.—*Erection of a greenhouse, in the East Park, Holderness Road.* Drawings and specification may be seen at the City Architect's Office. Tenders, sealed and endorsed "Tender for Greenhouse, East Park," are to be addressed to the Chairman of the Parks and Burial Committee, and delivered to the Town Clerk's Office, Hull, before 10 a.m. on May 16.

May 16. London, S.W.—*Carrying-out fire-resisting and other works to a store building at the Fountain Fever Hospital, Tooting, S.W., for the Metropolitan Asylums Board, in accordance with drawing and specification prepared by W. T. Hatch, M.I.C.E., M.I.M.E., engineer-in-chief.* Drawing, specification, conditions of contract, and form of tender may be inspected at the Office of the Board, Embankment, London, E.C., and can be obtained upon payment of a deposit of £1. Tenders, addressed as noted on the form, must be delivered at the Office of the Board not later than 10 a.m. on May 16.

May 16. Heslington.—*Building a farmhouse, at Bridge House Farm, Heslington, for C. W. Wilson.* Plans and specifications may be seen, and other information obtained, by applying at the office of J. Stalker, M.S.A., architect, Kendal, to whom tenders (under cover) are to be handed in not later than noon May 16.

May 17. Walmersley-cum-Shuttleworth.—*Enlargement and improvement of the Turn-1-th-Lane Council School, Walmersley-cum-Shuttleworth.* The plans may be seen at the Council Offices, Ramsbottom, and bills of quantities obtained at the offices of the county architect, Henry Littler, 16, Ribblesdale Place, Preston, by payment of a deposit of £1. Tenders must

be delivered before noon on May 17, sealed and endorsed, to W. Dilworth, Arden House, Summerseat, near Manchester.

May 17. Great Leighs.—*Structural alterations, and building new classroom, to the Council School, Great Leighs.* Plans, specifications and form of contract may be inspected at the office of the architect, Frank Whitmore, 73, Duke Street, Chelmsford, between 10 and 5, on any working day except Saturday. Builders desirous of tendering must send in their names and addresses to the architect on or before May 3, when copy of bills of quantities will be supplied to each applicant if references are satisfactory. Sealed tenders, endorsed "Tender for Great Leighs School Works," should be sent to J. W. Nicholas, secty., County Offices, Duke Street, Chelmsford, by May 17.

May 18. London, W.—*Pulling down the existing temporary iron buildings, and erecting, on the site fronting to Allardyce Street, Brixton, a new parochial hall, gymnasium and classrooms, caretaker's house, for the Vicar and Committee of St. Paul's, West Brixton.* Drawings and specification may be seen at the offices of C. E. Hewitt, architect, 21, Old Queen Street, Westminster, S.W., from whom also bills of quantities may be obtained on payment of a deposit of £5. Sealed tenders, on the forms supplied, must be delivered to the architect before noon on May 18.

May 18. Dundee.—*New school in the east end of the city, for the School Board.* Plans may be seen and schedules of quantities obtained on application to J. H. Langlands, architect of the Board, 31, Murraygate, Dundee. Offers must be sealed and marked "Tenders for New School," and lodged with John E. Williams, clerk, School Board Offices, Dundee, not later than noon on May 18.

May 19. Leeds.—*Supply of about 11,000 tons of best Craven or Derbyshire lime, required for the purification of gas at the several gas works, during the twelve months commencing on July 1, 1906.* Forms of tender may be had on application to the General Manager, Gasworks. Sealed tenders, endorsed "Tender for Lime," addressed to the Town Hall, Leeds, to be delivered not later than May 19.

May 19. Blackford.—*Alterations and additions to the County School, Blackford.* Drawings and specifications can be seen at the school. Sealed tenders must reach the County Education Office, Weston-super-Mare, before noon on May 19.

May 21. Lochgelly.—*Mason, brick, joiner, plumber, concrete, plaster, slater, iron, steel and glazier works for proposed bakery premises, Lochgelly, for the Lochgelly Co-operative Society, Ltd.* Plans and specifications may be seen, and all further information obtained, on application to James T. Scobie, architect, Dunfermline and Lochgelly. Schedules of measurements may be had from the Secretary on payment of £1 is. The estimates to be lodged with the secretary, John Mitchell on or before 10 a.m. on May 21, marked "Tender New Bakery Premises," on envelope.

May 22. Aintree.—*Erection of buildings for electric sub-station and battery station at Aintree, for Lancashire and Yorkshire Railway.* Plans can be seen and form of tender, quantities, and specification obtained on application at the Engineer's Office, Hunt's Bank, Manchester. Tenders endorsed "Tender for Electric Sub-Station, &c., at Aintree," to be in the hands of R. C. Irwin, secty., Hunt's Bank, Manchester, signed, not later than 10 a.m. on May 22.

May 22. Huntingdon.—*Additions and alterations to the following Council schools viz.: Fenstanton School, Warboys Fen School, Somersham School (mixed department).* Plans and specifications can be seen at the office of the county, 36, High Street, Huntingdon. Tenders must be forwarded to S. G. Cook, clerk to the County Education Committee, County Education Offices, 36, High Street, Huntingdon, by 10 a.m. on May 22.

May 22. London, N.E.—*Adaptation of Springfield House and stables as refreshment-rooms, superintendents' and gardeners' quarters, bothy, &c., and the erection of conveniences for men at Springfield Park, Clapton, N.E., for the London County Council.* Persons desiring to submit tenders may obtain the drawings, specifications, form of tender and other particulars at the Architect's Department, 15, Pall Mall East, S.W., upon payment to the cashier of the Council at the County Hall, Spring Gardens, S.W., of the sum of 10s. 6d. Tenders must be upon the official forms, and the printed instructions contained therein must be strictly complied with. Fair wages clause. Each tender is to be delivered at the County Hall, in a sealed cover addressed to the Clerk of the London County Council, Spring Gardens, S.W., and marked "Tender for Adaptation of Springfield House, &c." No tender will be received after 10 a.m. on May 22. Any tender which does not comply with the printed instructions for tender may be rejected.

May 22. Plymouth.—*Erection and completion of a lodge, &c., at the New Cemetery, Egg Buckland.* Plans and specification can be seen and forms of tender and bills of quantities obtained on deposit of £2 in cash, to the Borough Engineer. Sealed tenders, accompanied by the fully priced-out bills of quantities, to be delivered at the Borough Engineer's Office, Municipal Offices, Plymouth, not later than 5 p.m. on May 22.

May 25. Hythe.—*Erection of a new Council school to accommodate 250 infants at Hythe, Kent.* The drawings and specification may be inspected at the office of the architect, A. Bromley, Radnor Chambers, Folkestone. Any person desiring to tender must send in his name to the architect, accompanied with a deposit of £1, not later than noon on May 11. Tenders, on the form supplied, to be delivered to R. Lonergan, 11, Cheriton Place, Folkestone, not later than noon on May 25.

May 26. Poulton.—*Works required in the erection of new schools at Poulton for the Wallasey U.D.C., in accordance with the drawings and specification prepared by Joseph Holt, A.R.I.B.A., 9, Albert Square, Manchester.* Copies of bills of quantities and general conditions, with form of tender, may be obtained from the architect's office on receipt of a deposit of £1 is. Sealed tenders marked "Tender for Poulton School," to reach H. W. Cook,

clerk and solicitor, Public Offices, Egremont, Cheshire, not later than May 26.

May 26. Penzance.—*New Wesleyan Church at Richmond, Penzance.* The plans and specifications can be seen at the office of H. H. Pezack, Public Buildings, Penzance. Sealed tenders, endorsed "Tenders for Richmond Church," must be sent to the Rev. G. C. Mayes, 13, Regent Terrace, Penzance, on or before May 26.

No date. Guildford.—*Alterations and repairs to premises in the Walnut Tree Close Road, Guildford.* Bills of quantities may be obtained on application to E. Goodham Nye, P.A.S.I., architect and surveyor, Jenner Road, Guildford.

No date. Leeds.—*Alterations and additions.* Builders wishing to tender for alterations and additions to tobacco factory for Wood Brothers, Water Lane, can obtain quantities from the architect, F. Musto, A.R.I.B.A., Greek Street Chambers, Leeds. Complete tenders or separate trades optional.

No date. Wigan.—*Erection of a composite iron and wood building for use as a temporary secondary school for girls.* Plans and specification may be examined to the Education Offices, Borough Courts and Offices, King Street, Wigan.

ENGINEERING.

May 10. Hamilton.—*Providing and erecting a steel tank at Greenhill and in laying cast-iron pipes and carrying out relative works.* Plans may be seen and copies of the specification and schedule obtained at the office of the engineers, J. & A. Leslie & Reid, C.E., 72a, George Street, Edinburgh, on payment of £1. Tenders, endorsed "Tender for Greenhill Tank," must be lodged with W. E. Whyte, district clerk, District Offices, Hamilton, not later than by the first post on May 10.

May 11. Penrith.—*Ventilation works at the dining hall of the Workhouse, for the Guardians.* Plans and specifications may be seen and other particulars obtained from J. W. Smith, clerk, Public Offices, Penrith, to whom sealed tenders, endorsed "Ventilation," must be sent on or before May 11.

May 12. Hull.—*Cartage of pipes, trench work, laying and jointing of about one and a half miles of 30in. water main.* Plan may be seen and copy of specification and form of tender may be obtained of F. J. Bancroft, city water and gas engineer, on payment of £1. Cheques and postal orders to be made payable to T. G. Milner, city treasurer, Hull. Tenders, endorsed "Tender for Laying 30in. Main," are to be addressed to the Chairman of the Water and Gas Committee, and delivered at the Town Clerk's Office not later than May 12.

May 12. Portsmouth.—*Additions to the Stamshaw pumping station, with new engine pump and rising main in Simpson Road, Stamshaw.* On payment of the sum of £2 2s. a lithographed copy of the specification, general conditions and bill of quantities, with form of tender, can be obtained on application to the Town Clerk, and any further particulars can be obtained at the Borough Engineer's Offices, at the Town Hall, Portsmouth. Tenders, marked "Tender for Stamshaw Pumping Station Rising Main, &c.," must be filled up, signed and returned with the bills of quantities, duly filled in, to Alexander Hellard, town clerk, Town Hall, Portsmouth, not later than 10 a.m. on May 12. Fair wages clause.

May 14. Edinburgh.—*Arc lamp posts.* The specification, form of tender and drawings can be obtained from the Electrical Engineer, Dewar Place, Edinburgh, on payment of a deposit of £2 2s. Tenders on the prescribed form, enclosed in sealed envelopes and endorsed on the outside "Tender for Arc Lamp Posts," must be sent to the Town Clerk, City Chambers, Edinburgh, not later than May 14.

May 14. Langley Moor.—*Repairs to Esh Bridge.* Contractors desirous of tendering for this work may receive particulars from G. G. Donkin, surveyor, Langley Moor, by appointment. Tenders to be delivered to J. G. Wilson, Durham, on or before May 14.

May 14. Manchester.—*Extension of the refrigerating machinery and plant at Smithfield Market.* Specification and form of tender may be obtained on application at the City Surveyor's Office, Town Hall, Manchester, on payment to the City Treasurer of £2 2s. All cheques or postal orders are to be made payable to the order of "The Corporation of Manchester." Tenders, enclosed in the official envelopes and addressed to the Chairman of the Markets Committee, to be delivered at the City Surveyor's Office not later than noon on May 14.

May 14. Edinburgh.—*Arc lamps for street lighting.* The specification and form of tender can be obtained from the Electrical Engineer, Dewar Place, Edinburgh, on payment of a deposit of £1 is. Tenders on the prescribed form, enclosed in sealed envelopes, and endorsed on the outside "Tenders for Arc Lamps," must be delivered at the Town Clerk's Office, City Chambers, Edinburgh, not later than May 14.

May 15. Bristol.—*Widening, straightening and deepening of the bed or channel of a part of the River Frome lying under a street called the Broad Weir.* The specification and drawings may be seen at the office of the City Engineer, 63, Queen Square, and a copy of the instructions for tender, a form of tender, general conditions and specification and bill of quantities, with an addressed envelope, may be obtained at the same office on deposit of a cheque for £3. Tenders must be made on the forms provided, and must be delivered at the office of the City Engineer, enclosed in the envelope provided, not later than 10 a.m. on May 15.

May 15. Dufftown.—*Piping and cementing works in connection with the purification scheme proposed to be carried out near the Malt Kiln Burn.* Plans and specifications may be seen with Donald M'Kay, burgh surveyor, Dufftown, who will meet intending offerors on the grounds, on May 12, from 10 a.m. till 5 p.m.; and sealed tenders will be received by the Town Clerk on or before May 15.

May 15. Clare.—*Carting, excavating for and laying and jointing of about 3 miles of 4in. and 3in. cast-iron*

water-mains, including fixing valves, hydrants, &c., the erection of brick service reservoir, pumping station, and all works in relation thereto, for the R.D.C. Plans and specifications may be seen and copies of the quantities and form of tender obtained from the engineers, Sands & Walker, Milton Chambers, Nottingham, on payment of £2 2s. (by cheque). Sealed and endorsed tenders to be sent to S. L. Bigmore, clerk to the Council, Haverhill, Suffolk, on or before 10 a.m. on May 15.

May 15. Warrenpoint.—*Construction of sea baths for the U.D.C., in accordance with plans and specifications prepared by Kaye, Parry & Ross, civil engineers and architects, 63, Dawson Street, Dublin.* For the convenience of persons tendering for the above works bills of quantities, based upon the plans and specifications, have been prepared by Beckett & Medcalf, quantity surveyors, but their accuracy is not guaranteed. Copies of these bills can be obtained at the offices of the Architects on payment of £1. Tenders, enclosed in sealed envelopes, marked "Tender for Baths," and addressed to the Chairman of the Council, must be delivered at the Town Hall, Warrenpoint, on or before May 15.

May 15. Amphyll.—*Water supply:* (a) Supply, delivery and laying of about 7 miles of 6in., 4in. and 3in. cast-iron water mains, with sluice valves, hydrants, air valves and water-level indicator; (b) construction of engine and producer-house and brick-softening tanks at Crophill and a 150,000 gallon capacity service reservoir in Amphyll Park; (c) supply, delivery and erection of suction gas plants, gas engines, air compressors, surface pumps, softening plant, and well, with air lifting plant at Crophill, for the U.D.C. Drawings, specification, conditions of contract and forms of tender may be seen on and after May 3 at the offices of the engineers, W. R. & W. Phillips, Luton, Beds, from whom copies of same can be obtained on payment of £2 2s. for each (a) (b) and (c) contracts, half of which sum will be returned on receipt of a bona-fide tender if the copies of plans and specifications are returned to the Engineers. Sealed tenders on the prescribed form and endorsed "Amphyll Waterworks, Contract (a) (b) or (c) as the case may be, to be addressed to Alfred T. Trethewey, clerk to the Council, U.D.C. Offices, Amphyll, Bedfordshire, and delivered by May 15.

May 16. Salford.—*Supply and erection of a station meter (50,000 cub. ft. per hour capacity) at the Bloom Street Gasworks.* The drawings may be seen and copies of the specification and form of tender obtained (for which a charge of £1 is. will be made) on application to William W. Woodward, engineer, Gas Offices, Bloom Street, Salford. Sealed tenders, endorsed "Tender for Meter," addressed to the Chairman of the Gas Committee, Town Hall, Salford, to be delivered to L. C. Evans, town clerk, Town Hall, Salford, not later than 3 p.m. on May 16.

May 16. Leigh-on-Sea.—*Laying the following gas-mains for the U.D.C.:—500 lineal yds. 8ins. diameter, 57 lineal yds. 7ins. diameter, 460 lineal yds. 4ins. diameter.* Plans and specifications may be seen and particulars obtained at the office of John W. Liversedge, engineer and surveyor. Tenders to be signed, sealed and delivered to the Clerk on or before May 16.

May 16. Croydon.—*Overhead equipment of tramways, in Whitehorse Road.* Plans may be seen and specification, general conditions, and form of tender obtained at the Electricity Works, Factory Lane, Croydon, upon payment of a deposit of £1 is. Tenders to be endorsed "Tender for Overhead Equipment," and sent to F. C. Lloyd, town clerk, Town Hall, Croydon, by 11 a.m. on May 16.

May 17. Exeter.—*Rebuilding Ventover Bridge, Teigngrace, for the County Council.* The plans, specifications and form of contract can be seen at the office of the Council at the Castle of Exeter, where tenders are to be sent on or before May 17.

May 19. Athy.—*Waterworks.* For the execution of the following contracts, for the U.D.C.:—Contract No. 1: Constructing reservoir and intake wells and carting and laying about 10½ miles of 6in. to 3in. cast-iron pipes, valves, &c. Contract No. 2: Supplying and delivering in Athy about 670 tons 6in. to 3in. cast-iron pipes. Contract No. 3: Supplying and delivering in Athy the requisite valves, hydrants, &c. Plans and specifications can be seen at the Town Hall, Athy, or at the office of the solicitor to the Council, Valentine Kilbride, 4, Dame Street, Dublin; also at the office of the engineer, James F. Reade, A.M.I.C.E., 9, Bridge Street, Westminster, S.W., from whom copies of schedules may be obtained on payment of £1 for each contract. Sealed tenders to be delivered to J. A. Lawler, clerk to the U.D.C., board-room, Athy, not later than May 19.

May 21. Edzell.—*Cutting 1,820 yds. of pipe tracks, carting and laying 6in. and 4in. cast-iron pipes.* Apply for schedules of quantities to Alexander Philip, district clerk, Brechin, with whom tenders must be lodged on or before May 21.

May 21. Lymington.—*Building a new brick and concrete bridge over the stream at Bull Hill, in the parish of Boldre, for the Lymington R.D.C.* Plans and specifications of the work may be seen at 38, High Street, Lymington, any day (Sunday excepted) between 10 and 1. Sealed tenders marked "Tender Bull Hill Bridge" on the cover, must be sent to J. Davis Rawlins, clerk, Lymington, on or before May 21.

May 29. Swansea.—*One 600-h.p. C.C. steam generator with condensing plant, exhaust pipes, valves, connections, &c., for the Corporation.* Copies of the general conditions, specification and forms of tender can be obtained from the borough electrical engineer, C. A. L. Prusmann, Strand, Swansea, on payment of £2 2s. Additional copies of the specification can be obtained at 10s. per copy, which amount will not be returned. Further particulars may be obtained on application to the Borough Electrical Engineer. Sealed tenders, endorsed "Contract No. 29," to be delivered at the office of J. Thomas, town clerk, Town Hall, Swansea, not later than noon on May 29.

(Continued on p. xxii.)

THE TIMBER TRADE.

London Market in April.

THE wood trade was very much at a standstill during April. At the beginning of the month it was said that nothing more would be done till after Easter: then came the holidays, but at the end of the month there was still no sign of any renewal of activity. In London, Messrs. Churchill & Sim report, this is instanced by a reduction in the deliveries of 2,000 standards from the docks and 500 standards overside from the very small figures of the same month last year. Nevertheless, it is becoming daily more evident that, apart from Russian and Swedish red deals in the lower qualities, practically all other sizes and classes of wood must gradually appreciate in price as the year draws on, and the supplies be barely sufficient to meet the most moderate estimates of requirements. An event of some moment to London importers occurred during the month in the offer of a reduction of the charges for the landing and storage of soft woods made to the trade by the London and India and the Millwall Dock companies. So far as this leads to any cheapening of the port, it is wholly to the good, but the proposal at present hardly looks as if it would compensate for the dislocation and inconvenience involved in shifting the centre of the wood business of London. Freights remain on about a normal basis, being kept very steady by the continuance of a prosperous general trade.

The abstract of dock stock, consumption, &c., for April, published by Messrs. Foy, Morgan & Co., is given in the table at the foot of this page.

Dock Stock.

The stock of wood in the public docks on April 30th was:—

	Pieces.
Foreign deals and ends - - -	742,000
Do. battens - - -	1,309,000
Pine deals and battens - - -	604,000
Spruce do. do. - - -	530,000
Boards, rough - - -	2,612,000
Do. prepared - - -	4,992,000

totalling 10,789,000 pieces, as against 13,601,000 in 1905, 15,457,000 in 1904, and 14,591,000 in 1903.

In other kinds the stock was as follows:—

	Pieces.
Foreign wainscot logs - - -	417 pieces.
Do. oak timber - - -	540 loads.
Do. fir timber - - -	1,404 do.
Do. Oregon pine, &c., spars and masts - - -	5,097 do.
Colonial oak timber - - -	1,083 do.
Do. birch timber and planks - - -	3,073 do.
Do. elm and ash timber - - -	595 do.
Do. yellow pine - - -	232 do.
Do. red pine - - -	64 do.
United States pitch-pine timber - - -	12,175 do.
Do. do. deals - - -	15,000 pieces.
East India teak - - -	6,542 loads.

Deliveries.

The deliveries have been—

	First four months. Pieces.	April. Pieces.
Foreign deals and ends - - -	1,103,000	246,000
Do. battens - - -	1,814,000	407,000
Pine deals and battens - - -	346,000	81,030
Spruce do. do. - - -	395,000	84,000
Boards, rough - - -	1,824,000	377,000
Do. prepared - - -	4,516,000	1,040,000

totalling 9,995,000 pieces for the first four months and 2,235,000 for April.

The deliveries direct from ship to craft have been—

	First four months. P.s.h.	April. P.s.h.
Deals and battens - - -	10,018	2,955
Boards - - -	3,544	953
Total - - -	13,562	3,908

Soft Woods.

Swedish Deals and Battens.—The demand continued quiet throughout the month both in London and for fresh business from abroad. Prices remained steady, and in London the very scanty stock of deals led to some little improvement in price in the few cases that they were enquired for. Prices for prepared boards went no higher during the month.

Norwegian Boards.—The arrivals of prepared boards were more numerous than they were at this time last year, and prices perhaps eased a little here and there in the absence of immediate demand during the holidays.

Russian Deals.—A very quiet demand and no change in prices (except for a little improvement on the few deals that were wanted as they became harder to find) about sums up the course of the market for wood in London from the Russian ports during April. There was very little further negotiation for fresh supplies.

Finnish Battens.—The demand has been feeble, but prices have remained quite steady.

Prussian Timber.—There was a normal arrival in April, and fir timber has come to a good market. Prices are certainly a point up in sympathy with the cost of pitch-pine. The demand for foreign oak timber leaves something to be desired. The trade was a very small one here during the month.

Canadian Timber.—Demand was lacking in London both for pine and spruce deals during April, and prices had in consequence a tendency to fall away, which is quite at variance with the outlook for the cost of further supplies. For most of the hardwoods and for yellow-pine timber the tendency has been in the same direction, oak alone remaining fairly steady in price when of regular quality.

There is no change visible in the prospects for sawn timber, and this market remains quite steady at the high rates previously attained to. The consumption is being rather restricted, but with the small supply available, the stock necessarily remains in very moderate compass, and at the same time the endeavours made to substitute other timber for pitch-pine are not proving very successful. For pitch-pine planks the London market responded rather freely to the situation during April, and a considerable rise in price has been established here and made effective.

Hardwoods.

East India Teak.—Messrs. C. Leary & Co. report that the imports for April were the heaviest for a long time past, but although the demand was not very active, prices were not affected nor are they at present likely to become so to any material extent, as it is not probable that shipments will continue on the scale of April. For planks the tone at first was dull, leading sellers to make some small concessions in price; buyers, however, took advantage of the opportunity to cover their requirements, so that values, as in March, quickly regained their former levels. Quotations, according to specifica-

tion, are for timber £12 10s. to £19, for flitches £16 to £20, and for planks £13 10s. to £19 10s. per load on c.i.f. terms. The arrivals of timber were 598 loads from Burmah, 251 loads from Bangkok and 188 from Java.

American Oak.—There is no improvement in the market for quartered; prices range from 2s. to 4s. 9d. per cubic foot. In plain the stock of planks is unusually light and fresh supplies meet with a ready sale at advanced prices. The demand for boards is weaker; prices range from 1s. 2d. to 2s. 9d. per cubic foot.

American Whitewood.—A steady market, but buyers do not respond readily to the advanced prices asked by shippers; values of first quality are 2s. 6d. to 3s. 6d. per cubic foot, for clear saps 1s. 10d. to 2s. 1d., for medium 1s. 8d. to 1s. 10d., for culls 1s. 2d. to 1s. 3d.

Mahogany.—The market continues to be very poorly supplied with all descriptions, and, as sales have been considerable, stocks are steadily declining. Prices are very firm, and any improvement in trade would soon bring higher rates.

Trade and Craft.

Boilers.

A very complete catalogue of boilers for all kinds of work has been issued by Messrs. Lumby, Son & Wood, Ltd., of Greetland, Halifax, a firm which has had very considerable experience in this class of apparatus, having been engaged in the manufacture of boilers for a period of nearly fifty years. Their new works comprise a site of five acres, and give employment to about 400 workmen. Machinery of the most modern type has been installed. The catalogue in question includes a great number of types of boilers for hot-water heating, these being of the "Solar" cast-iron type; while a great number of varieties of radiators—single, double and treble-column—are shown. Steam boilers occupy another section, together with calorifiers, steam-heaters, bath-boilers, &c. Special attention is directed to the firm's patent "Pioneer" boiler for low-pressure steam heating, which effects a great economy in fuel and requires the minimum of attention. All these boilers have double jackets of extra thickness so as to prevent the outer casing becoming too hot. Manhole covers, valves, strong-room and fireproof doors, and safes are also illustrated in the catalogue.

Ventilating Appliances.

A number of patent ventilating appliances are manufactured by the Acme Ventilating and Heating Co., of 35, Tarleton Street, Liverpool. One of these is the "Acme" patent concealed roof ventilator for fixing in line with the slates below the ridge, another is the "Acme" exhaust louvre ventilator, another the "Acme" ridge cap exhaust ventilator. The firm also supplies numerous varieties of ventilators for rooms, besides Tobin tubes, wall inlets, &c. Another speciality of the firm is a regulating window ventilator, comprising a series of glass slats in holders fixed to a frame arranged to be opened and closed by a single cord or chain.

HIGHEST WORKMANSHIP. PUNCTUAL DELIVERY.

(Continued from p. 255.)

June 16. Johannesburg.—*Watering cars and spare parts.* Supply and delivery, after erection for inspection at makers' works, of three electric watering cars for use on the Council's tramway system, together with various spare parts for the cars. Tenders are to be made for delivery f.o.b. at any port suitable for shipment to South Africa, but separate prices must also be given for (a) delivery of the cars and spare parts at the car sheds, Johannesburg, (b) the erection of the cars complete in Johannesburg. Tenders are to be addressed to the Town Clerk, Municipal Offices, Johannesburg, and must reach him not later than June 16. The general conditions, specification, and form of tender may be seen on and after May 10 at the offices of the Council's consulting engineers, Mordey & Dawbarn, 82, Victoria Street, S.W., and may be obtained from them on payment of £5 5s. Further copies of the general conditions, specification and forms of tender may be obtained from the Consulting Engineers on payment of 10s., which will not be returned.

IRON AND STEEL.

May 10. Hollingburn.—*Supply of a galvanized riveted steel closed top oil tank,* with a capacity of 500 gallons, to be delivered and fixed at the Headcorn Sewerage and Sewage-disposal Works, for R.D.C. A specification may be seen at the Clerk's Office, between 9 and 6 (Saturday 9 and 1). The Council further invite separate tenders for the supply of "Rocklight" oil, to be delivered and pumped into the storage tank at the works in 400 gallon lots, for a period of three months. Sealed tenders for the above, marked outside "Oil," must reach H. J. Bracher, clerk, 33, Earl Street, Maidstone, not later than 10 a.m. on May 10.

May 12. Hull.—*1,250 tons of 30in. cast-iron pipes and special castings.* Copies of specification, drawings and forms of tender may be obtained of E. J. Bancroft, city water and gas engineer, on payment of £1. Cheques and postal orders to be made payable to T. G. Milner, city treasurer, Hull. Tenders, endorsed "Tender for 30in. Pipes and Specials," are to be addressed to the Chairman of the Water and Gas Committee, and delivered at the Town Clerk's Office not later than May 12.

May 12. Manchester.—*Supply, delivery and erection of a cast-iron water tank with steel girders* for supporting same, also the taking down and reconstruction of an existing water-tank at the Bradford Road Station. Specification and bill of quantities can be obtained from C. Nickson, superintendent, Gas Department, Town Hall, Manchester. Drawings may be seen on application to J. G. Newbigging, M.I.C.E., Rochdale Road Station. Sealed tenders, addressed to the Chairman of the Gas Committee, and endorsed "Tender for Cast-iron Tank, &c.," must be delivered at the Gas Offices, Town Hall, Manchester, not later than noon on May 12.

May 13. Leeds.—*About 11½ miles of mild steel pipes* (4,620 tons in weight), varying from 32 ins. to 35 ins. in diam., delivered at Birstwith (Ripley Valley), Wormald Green and Ripon Stations, North-Eastern Railway. Plans may be seen and specification and form of tender obtained at the office of C. G. Hensell, M.I.C.E., waterworks engineer, Municipal Buildings, Leeds, on payment of a deposit of £5. Tenders, properly endorsed "Tender for Steel Pipes from Kettleing to Kirkby Malzeard," to be received at the Town Clerk's Office, Town Hall, Leeds, not later than 10 a.m. on May 18.

May 21. Edzell.—*610 cast-iron water-pipes 6in. and 4in. in diameter, sluice valves, &c., for the Edzell Water District Sub-Committee.* Apply for schedules of quantities to Alexander Philip, district clerk, Brechin, with whom tenders must be lodged on or before May 21.

June 9. Johannesburg. *Supply and delivery of 20,000ft. 3in., 12,000ft. 1in., 7,000ft. 3in., and 2,000ft. 4in. galvanized iron water piping, for the Central South African Railways.* Forms, &c., may be obtained from the Chief Railway Storekeeper, Germiston, and the Railway Storekeepers, Pretoria and Bloemfontein. Tenders to be sent to the Secretary, Tender Board, Railway Headquarters Offices (P.O. Box 4,570), Johannesburg, by June 9.

PAINTING AND PLUMBING.

May 10. London, E.—*Distempering and painting works at the Children's Homes, Stifford, near Grays, Essex, for the Guardians of Stepney Union.* Specification and form of tender, &c., can be obtained on application to T. G. Stacey, clerk, Guardians' Offices, Barnes Street, Commercial Road, E., to whom tenders must be delivered by 4 p.m. on May 10.

May 10. Alcester.—*Painting and decorating the central stores and warehouses of the Alcester Co-operative Society, specification of which may be obtained of the Secretary.* Tenders to be sent in sealed envelopes, addressed to the Committee, Co-operative Stores, Alcester, not later than May 10.

May 10. London, S.E.—*Whitewashing, cleaning and painting work at the Infirmary, East Dulwich Grove, S.E.* The specification can be seen and all information obtained at the offices of the Steward of the Infirmary as above, between 10 and 4. Tenders, endorsed "Painting, &c.," should be addressed to the Guardians of the Southwark Union and delivered at the Union Offices, John Street West, Blackfriars Road, S.E., by 4 p.m. on May 10.

May 10. Peterborough.—*Supply of lead pipe, plumbers' metal, and pig lead for twelve months for the Town Council.* Further information and specification with forms of tender may be obtained on application at the City Engineer's Office, Market Place, where sealed tenders must be delivered on or before May 10.

May 12. Wigan.—*Cleaning, pointing, painting, &c., of the interior of the three chapels at the Wigan Cemetery.* Specification can be obtained at the office of the Borough Engineer, King Street West. Tenders, endorsed "Painting at Cemetery," to be delivered to Harold Jevons, town clerk, Wigan, not later than noon on May 12.

May 12. Manchester.—*Painting the galleries at the Royal Institution, Mosley Street.* Apply to the City Architect, Town Hall, before May 12.

May 12. Brymbo.—*Painting, &c., at the Workmen's Institute.* For particulars apply to W. H. Phoenix, High Street Brymbo. Tenders to be in by May 12.

May 14. London, S.E.—*Cleansing, repair and painting of schools, to be executed during the summer vacation.* Persons desiring to tender are requested to make written application to William Jacques, A.R.I.B.A., architect to the Education Committee, 2, Fen Court, E.C., for copy of specification and form of tender on or before May 5, which application must be accompanied by a deposit of £1 (cheques will not be accepted). Sealed tenders in the envelope supplied to be delivered at the Education Department, 95, The Grove, Stratford, E., not later than 5.30 p.m. on May 14. Fair wages clause.

May 15. Aldershot.—*Painting of the public lamp columns of the town.* Specification may be seen and all particulars obtained upon application at the Surveyor's Office. Tenders, endorsed "Lamp Column Painting," to be sent to W. E. Foster, clerk, Municipal Buildings, Aldershot, on or before May 15.

May 16. Swanley.—*Cleaning and painting works at White Oak School, Swanley, Kent, in accordance with specification prepared by W. T. Hatch, M.I.C.E., M.I.M.E., engineer-in-chief, for the Metropolitan Asylums Board.* Specification, conditions of contract and form of tender may be inspected at the Office of the Board, Embankment, London, E.C., and can be obtained upon payment of a deposit of £1. Tenders, addressed as noted on the form, must be delivered at the Office of the Board not later than 10 a.m. on May 16.

May 16. London, N.E.—*Cleansing certain wards, &c., at the Infirmary, High Street, Homerton, N.E., for the Hackney Guardians.* Specification, conditions of contract, and form of tender can be obtained of the Clerk between 10 a.m. and 4 p.m. Sealed tenders, endorsed "Cleansing Infirmary," must be delivered to Frank R. Coles, clerk to the Guardians, Clerk's Office, Sidney Road, Homerton, N.E., by 2 p.m. on May 16.

May 17. Preston.—*Painting the tramway poles and section boxes.* Particulars may be obtained from the General Manager, Power Station, Holmrook Road, Preston, to whom sealed tenders, endorsed "Tender for Painting Tramway Poles," must be delivered not later than noon on May 17.

May 22. Cardiff.—*Painting the cab shelters of the Corporation.* Further particulars may be obtained from the Head Constable, Chief Police Station, Cardiff. Tenders, endorsed "Painting Cab Shelters," must be delivered to the Town Clerk, Town Hall, Cardiff, before May 22.

May 23. Bootle.—*Painting the railings, gates, &c., in Derby Park.* Specification may be seen, and forms of tender obtained, at the office of the Borough Engineer. Sealed tenders, and endorsed "Painting, Derby Park," must be sent to J. Henry Farmer, town clerk, Bootle, not later than 10 a.m. on May 23.

May 24. Rainhill.—*Work and materials required at the main building of the County Asylum, as well as of all other properties and buildings which are described in a specification, which may be seen on application to the Clerk.* Arrangements will be made to allow tradesmen who are desirous of tendering to view the work required at 10.30 prompt on the mornings of Wednesday and Thursday, 9th and 10th inst. Tenders must be delivered at the office of J. Gornali, clerk and steward, not later than 5 p.m. on May 24, marked "Painting."

May 24. Bootle.—*Cleaning and painting at the Museum Rooms, Central Library, Oriol Road.* Specification may be seen, and forms of tender obtained, at the office of the Borough Engineer. Sealed tenders, and endorsed "Painting at Museum," to be delivered to J. Henry Farmer, town clerk, Town Hall, Bootle, not later than 10 a.m. on May 24.

ROADS AND CARTAGE.

May 10. Blyth.—*Tar-macadamizing Market Street and portion of Bowes Street (about 2,600 sq. yds.), for the Cowpen U.D.C.* Plans and specifications may be seen and form of tender obtained at the offices of R. Grieves, surveyor, Seaforth Street, Waterloo, Blyth. Sealed tenders, endorsed "Tender for Street Work," must be delivered not later than 4 p.m. on May 10.

May 11. Edinburgh.—*Six street watering carts* capable of containing about 400 gallons. Further particulars may be had from the Inspector of Cleansing, 331, High Street. Offers, marked "Watering Carts," to be lodged with the Town Clerk not later than May 11.

May 14. East Preston.—*Supply of flints in the parishes and in the quantities named below, at per cub. yd., for the R.D.C.* Tenders must state whether the flints are hand-picked, or dug from pits; also whether broken or not:—Angmering, 180 cub. yds.; Burham, 160 cub. yds.; Clapham, 120 cub. yds.; Clymington, 250 cub. yds.; Durrington, 650 cub. yds.; Ferring, 150 cub. yds.; Ford, 120 cub. yds.; Goring, 500 cub. yds.; Houghton, 70 cub. yds.; Lyminster, 550 cub. yds.; Patching, 50 cub. yds.; Poling, 160 cub. yds.; Rustington, 250 cub. yds.; South Stoke, 75 cub. yds.; Tortington, 100 cub. yds.; Warningcamp, 120 cub. yds. Tenders to be made only on forms to be obtained from A. Shelley, clerk, Town Offices, Littlehampton, by May 14, clearly marked on outside, "Tender for Flints."

May 14. Dover.—*Street watering and carting.* Specifications and forms of tender may be obtained at the office of the Borough Engineer, Maison Dieu House, Biggin Street, Dover. Tenders, endorsed "Tender for Street Watering, &c.," may be sent to Wollaston Knock, town clerk, Town Clerk's Office, Castle Hill House, Dover, on or before May 14.

May 14. Romford.—*Supply of 800 tons of best-quality blue Guernsey granite broken to 2in. cube and 200 tons of best quality blue Guernsey granite broken to 1½in. cube, also 40 tons of Rhenish Basalt stone broken to 2in. cube, for the R.D.C.* Specification and form of tender

may be obtained from George Lapwood, highways surveyor, Victoria Chambers, Romford. Sealed tenders (endorsed "Tenders for Granite, &c."), together with samples of granite and stone proposed to be supplied, which must be sent carriage paid to reach W. Smith, clerk to the Council, 13, North Street, Romford, on or before May 14.

May 14. Worton.—*Re-making the path from the district road to the parish church at Worton, for the Devizes R.D.C.* Specifications may be obtained of the Council's Surveyor. Sealed tenders, endorsed "Tender for Worton Path," to be sent to John Mitchell, surveyor, Chittoe, Chippenham, not later than May 14.

May 14. Billericay.—*Carting material, and also for horse, harness and man for occasional work, and for water carts, up to 31st March, 1907; also for steam rolling, for the R.D.C.* Forms of tender can be obtained of F. E. Ennals, Ongar Road, Brentwood; or R. J. W. Layland, Billericay. Tenders to be sent to the Clerk, and marked "Tender for Team Labour," by May 14.

May 14. Billericay.—*Stone, for the R.D.C., as follows:—Guernsey granite, Queenast granite, Kentish rag, flints, according to forms of tender, to be obtained of F. E. Ennals, Ongar Road, Brentwood; or R. J. W. Layland, Billericay.* Tenders to be sent to the Clerk, and marked "Tender for Stone," by May 14.

May 16. East Stow.—*Carting road materials in the several parishes of the East Stow R.D. during the ensuing year.* Forms of tender, giving all necessary particulars, can be obtained of Gordon Harrison, surveyor, Stowmarket. Tenders to be sent in envelopes, which will be provided for the purpose, to R. E. Wilkes, clerk to the Council, Stowmarket, by 4 p.m. on May 16.

May 16. Leeds.—*Making of tar macadam roadways and asphalt footpaths in the following streets: Gledhow Wood Grove, Gledhow Wood Avenue, Lidgett Grove and Lidgett Avenue.* Plans and specifications may be seen at the City Engineer's Office, Municipal Buildings. Tenders, on forms supplied, must be sent to the Town Clerk's Office on or before May 16, addressed to the Highways Committee, and endorsed "Tenders for Private Street Works."

May 19. Leith.—*Paving, with cement concrete, lane at Park Road.* Plans and specifications of works may be seen, and information obtained, at the Burgh Surveyor's Office, Charlotte Street. Tenders, marked "Paving," to be lodged with T. B. Laing, town clerk, Town Clerk's Office, Leith, on or before May 16.

May 21. Stevenage.—*Granite.* Supply of 1,000 tons (more or less, as may be required) of 1½in. to 2in., 1½in. to 1½in. and 1in. to 1½in. broken Guernsey, Leicester or other granite, for the repair of the roads in the district, to be delivered at Stevenage Railway Station and sidings (G.E.R.) as and when required up to Mar. 31 next. Sealed tenders, endorsed "Tender for Granite," accompanied by samples, to be delivered to W. Onslow Times, clerk to the Council, U.D.C. Offices, Stevenage, not later than 4 p.m. on May 21. The Council have no special form of tender.

May 21. Petworth.—*Carting materials to the various lengths of road in the several parishes of Petworth, Wisborough Green, Kirdford, Northchapel, Sutton, Bury, Coates, Fittleworth, Edgeland and Stopham; and for supplying and carting materials to the various lengths of road in the several parishes of Bury, Bignor, Sutton, Barlavington, Duncton and Burton, for the R.D.C.* Forms of tender with the number of cub. yds. required to be provided and carted on each particular length of road, will be sent by the Clerk or by the Surveyor of the Council, Fox Hill, Petworth, on receipt of a stamped addressed envelope, to all persons desirous of tendering. The supply and carting required under any accepted tender will have to be done at such time and in such quantities as the Council or their Surveyor may direct. Sealed tenders, endorsed "Tender for Highways," to be sent to Ernest H. Staffurth, clerk, Petworth, on or before 5 p.m. on May 21.

May 23. Ramsgate.—*Supply and delivery of 3,000ft. 6in. by 12in. granite edge kerb.* Specification and form of tender may be obtained on application to the Borough Engineer's Office. Sealed tenders, on forms supplied, must be delivered at the Borough Engineer's Office, Albion House, Ramsgate, not later than May 23.

May 23. Bootle.—*Construction of Wadham Road through the South Recreation Ground and the Bootle Cricket Ground.* Plans and specification may be seen, and bills of quantities obtained at the office of the Borough Engineer. Tenders, sealed, and endorsed "Tender for Construction of Wadham Road," to be delivered to J. Henry Farmer, town clerk, Town Hall, Bootle, not later than 10 a.m. on May 23.

May 24. Aston Manor.—*Paving of the court known as 7 Court, Phillips Street, with granite setts, and other works in connection therewith.* Plans and specification may be seen, and bills of quantities obtained, on application at the Surveyor's office. Sealed tenders, endorsed "Paving," are to be addressed to the Chairman of the Public Works Committee and delivered at the Town Clerk's Office not later than noon on May 24. Fair wages clause.

May 28. Old Hill.—*Forming, metalling, kerbing, channelling, paving, draining and making Meadow Street, Old Hill, for the Rowley Regis U.D.C.* Plan and specifications may be seen at the Council Offices, Lawrence Lane, Old Hill, between 10 and 4 (Saturdays 10 to 1). Tenders, duly endorsed, must be in the hands of Daniel Wright, clerk, Council Offices, Old Hill, Staffordshire, not later than noon on May 28.

SANITARY.

May 11. Edinburgh.—*Construction of a new convenience at Tollcross, conform to plans, specification and schedule of measurement prepared by the Borough Engineer, from whom schedules of quantities and all particulars may be obtained.* Sealed tenders, marked "Tender for Tollcross Convenience," must be lodged with Thomas Hunter, W.S., town clerk, City Chambers, Edinburgh, not later than May 11.

May 11. Fleetwood.—Construction of the pumping station buildings, storage tanks, mains, screens, fences, &c., at Fleetwood. The drawings, prepared by George R. Strachan, M.I.C.E., may be seen, and copies of specification and bills of quantities obtained at the Clerk's office on payment of a deposit of £5. Sealed tenders, endorsed "Tender for Pumping Station, &c." are to be delivered at the Clerk's office at or before 10 a.m. on May 11.

May 14. Yardley.—Construction of the following foul-water sewers:—1,275 yds. or thereabouts of 12in. pipe sewer; 950 yds. or thereabouts of 9in. pipe sewer, together with manholes, and all works appertaining thereto, in accordance with plans, drawings, specification and conditions of contract, which may be seen on application to the Engineer and Surveyor, Arthur W. Smith, at the Council House, Sparkhill, near Birmingham. Specification, bill of quantities and form of tender may be obtained on payment of £3 3s., to F. L. Thompson, clerk. Sealed tenders, endorsed "Reddings Lane Sewerage," to be addressed and delivered to Francis Ladbury Thompson, clerk of the Council, Council House, Sparkhill, near Birmingham, not later than noon on May 14. Fair wages clause.

May 14. Acton.—Construction of 3½ miles of sewers, varying from 6ins. to 6ft. in diameter, 2½ acres of filter beds, and various works connected therewith, for the U.D.C. Instructions for tender and forms of tender, with the form of contract and schedules annexed, can be obtained and the drawings inspected at the offices of Sir Alexander Binnie & Sons, 9, Great George Street, Westminster, on payment of £2. Tenders, enclosed in a sealed cover and addressed in the manner provided in the instructions for tender, must be received at the offices of the clerk to the Acton U.D.C., 242, High Street, Acton, not later than May 14.

May 16. Salford.—3,500 sq. yds. of hard floor tiles, similar to the sample which may be seen at the Salford Sewage Works, Weaste. Forms of tender and particulars may be obtained at the Borough Engineer's office, Town Hall, Salford. Tenders, endorsed "Filter Tiles," addressed to the chairman of the River Committee, must be delivered to L. C. Evans, town clerk, Town Hall, Salford, by noon on May 16.

May 17. Harborton.—Constructing a sewage tank and filter-bed and for providing and laying 560ft. of 9in. and 600ft. of 6in. (or thereabouts) of stoneware pipe drain at the village of Harborton, for the Toines R.D.C. Plan and specification can be seen at the "Globe" Inn, Harborton, or at the office of the surveyor, W. F. Tollit, 10, High Street, Toines. Tenders are to be sent to F. K. Windeatt, clerk, Toines, on or before May 17.

May 18. Kendal.—Constructing 527 lineal yds. of 9in. pipe sewers. Plans and detail drawings can be seen, and bills of quantities obtained at the office of the Borough Engineer. Sealed tenders, endorsed "Contracts Nos. 22, and 23," to be delivered to R. Hampton Clucas, C.E., M.S.E., borough engineer, Town Hall, Kendal, at or before noon on May 18.

May 22. Cavan.—New closets and large cistern, and carrying out the new system of sewerage on the workhouse premises, in accordance with the specification and plans prepared by Thomas O'Brien. The names and addresses of two solvent sureties to be given. Tenders to be sent by post prepaid and registered, and to bear the Cavan postmark, to Joseph D. Grier, clerk of Union, Cavan, not later than May 21. Specification can be seen at the Boardroom.

May 23. Ladybank.—Construction of sewerage and drainage works, comprising the laying of fireclay pipes, the building of manholes, flushers, septic tanks, bacteria filter beds and other relative works. Drawings may be seen and copy of specification, schedule of quantities and form of tender obtained from Bruce, Proudfoot & Macrae, C.E., Cupar, upon payment of £2 2s. Contractors who have obtained a copy of the specification and schedule will have an opportunity of being shown over the proposed line of sewers, &c., on May 14, starting from Ladybank Station at 11 a.m. The tender must be delivered in a sealed cover, marked "Ladybank Sewerage," to J. L. Anderson, town clerk, Cupar, by 10 a.m. on May 23.

May 23. Bootle.—Construction of a sewer along Miranda Road continuation, across the South Recreation Ground. Plans and specification may be seen and bills of quantities obtained at the office of the Borough Engineer. Tenders, sealed and endorsed "Tender for Miranda Road Sewer," to be delivered to J. Henry Farmer, town clerk, Town Hall, Bootle, not later than 10 a.m. on May 23.

May 28. Bootle.—Construction of public conveniences on the east side of Miranda Road continuation, adjoining the Bootle Cricket Ground. Plans and specification may be seen and bills of quantities obtained at the office of the Borough Engineer. Tenders, sealed and endorsed "Public Conveniences, Miranda Road," to be delivered to J. Henry Farmer, town clerk, Town Hall, Bootle, not later than 10 a.m. on May 28.

TIMBER.

May 10. Aberdeen.—Supply of larch posts and rails to be delivered at Torphins, Aboyne and Ballater. Schedules of quantities, &c., may be had on application to John Milne, district surveyor, Aboyne, and sealed offers will be received by John Murray, district clerk, 22, Bridge Street, Aberdeen, up to May 10.

May 14. Kingston.—Supply of 120 fathoms of best Swedish board ends, first quality, square edge, to be delivered at the Workhouse, Kingston-on-Thames, as and when required. Tenders must reach James Edgell, solicitor, clerk, Union Offices, Coombe Road, Kingston-on-Thames, marked "Tender for Wood," by May 14. The Guardians do not issue forms of tender for the supply of wood.

May 14. Dublin.—Supply of 30,000 10in. by 10in. sleeper blocks, for the Great Northern Railway Co. (Ireland). Specification and form of tender can be obtained

from the Secretary on payment of a fee of 1s. each. Tenders, which must be made out on forms supplied by the Company, and endorsed "Tender for Sleeper Blocks," should be delivered to T. Morrison, secretary, Amiens Street Terminus, Dublin, by 10 a.m. on May 14.

May 15. Plymouth.—Supply of a quantity of firewood, not exceeding 150 tons, for the Guardians. Tenders must be on forms provided for that purpose, to be obtained at the office of W. Adams, clerk to the Guardians, 13, Princess Square, Plymouth, and must give full particulars. Tenders by noon on May 15.

No date. Sunderland.—Supply of props, crowns, sleepers, deals, Norway, &c., timber for the year ending June 1, 1907, for the Ryhope Colliery. For forms of tender apply to the offices, Ryhope Colliery, near Sunderland.

MISCELLANEOUS.

May 11. Greenock.—Supply of the following stores, for the Corporation, for one year:—Lime shells; meters; retorts, firebrick, &c.; iron and steel furnishings; cast-iron pipes &c.; brass fittings, &c.; lead, tin and compo pipes; retort mouthpieces; glass; paints, oils, &c.; timber; sand; cements; cartages (Inchgreen); cartages (town); gasfitter; plumber (Town); plumber (Inchgreen); slater; insmith; ironmongery. * Tradesmen willing to offer for these requirements are requested to submit their names. Form of tender and further particulars can be had from William Ewing, engineer and manager, Inchgreen Gasworks. Tenders to be returned, and names of tradesmen submitted, to Colin MacCulloch, town clerk, Greenock, not later than May 11.

May 14. Manchester. Supply of the following stores for the tramways:—Self-acting surfacing and screw-cutting lathe, brassfinishers' lathes, universal milling machine, double car-wheel lathe, car-wheel tyres and axles, iron castings. Specifications and forms of tender may be obtained on application to J. M. McElroy, general manager, Tramways Department, 55, Piccadilly, Manchester. Tenders are to be addressed to the chairman of the Tramways Committee, 55, Piccadilly, Manchester, and must be received not later than 5 p.m. on May 14.

May 15. Bradford.—Supply of the following stores, for the Corporation:—Iron castings, iron, steel, bolts and nuts, oils, street-sweeping machine brushes, brooms, shovels, nails, lime, paints, iron piping. Forms of tender and all necessary information may be obtained on application to Superintendent Call, at the Hammerton Street Depot. Sealed tenders, duly endorsed, to be sent to Frederick Stevens, town clerk, Town Hall, Bradford, on or before May 15. Fair wages clause.

May 15. Dundee.—Supply of the following materials for the Water Commissioners:—Special castings, sluice valves, brass work, blacksmith work. Specifications and forms of tender may be had on application at the office of George Baxter, engineer and manager, Water Engineer's Office, 93, Commercial Street, Dundee and sealed offers, suitably endorsed, must be lodged with William H. Blyth Martin, clerk to the Commissioners, City Chambers' on or before May 15.

May 15. Glasgow.—Supply of the following stores for the sewage department for one year, from 1st June next, according to standard samples, to be seen at the office of the Sewage Department, 30, Cochrane Street:—Iron, ironmongery, bolts and nuts, iron castings, brass furnishings, wood (foreign), brushes, glazier work, oils, grease, paints, lime, cement, fireclay goods and common bricks. Specifications and forms of tender may be had on application to Thomas Melvin, general manager, 30, Cochrane Street. Sealed offers, marked outside "Offers for Sewage Department," must be lodged with A. W. Myles, town clerk, City Chambers, Glasgow, on or before May 15.

May 19. Leeds.—Supply of the following articles:—Wrought-iron tubes, pressed and common red bricks, 2½in., 3in. and 4in. self-faced Bradford or Hatifax flags. Forms of tender may be had on application to the General Manager, Gasworks. Endorsed tenders, addressed to the Town Clerk, Town Hall, Leeds, to be delivered not later than May 19.

May 22. Wallsend.—Supply of the following stores, for the Corporation:—Brooms, broom handles, pick heads, pick shafts, shovels No. 4, No. 6 and Black's No. 4, manhole covers and frames weighing not less than 4½ cwt., gulleys weighing not less than 4 cwt., 2 qrs., 12 lbs., sanitary pipes, bends and junctions, whinstone zin. hand broken, whinstone chips, whinstone sets 4ins. by 5ins. and 3ins. by 4ins., bricks, ballast, sand, lime, cement, limestone and slag (crushed). Tenders must be sent to the Town Clerk, marked "Tender for Goods," on or before noon on May 22. Samples and approximate quantities of each article required may be had on application at the Corporation Offices, Hugh Street, Wallsend, but any such information will be a matter of opinion only, and not binding on the Corporation nor in any way releasing any contractor from his contract.

No date. Bristol.—Supply of plant, &c., for the Electricity Department:—One 3,000 kw. (6,000 volt) three-phase turbo-alternator, together with condensing plant for the same; one 500 kw. motor-generator or rotary converter (6,000 volts A.C. to 500 volts D.C.); two 300 kw. motor-generators or rotary converters (6,000 volts A.C. to 500 volts D.C.); extensions of E.H.T. switchgear (6,000 volts A.C.); extensions of H.T. switchgear (2,000 volts A.C.); extensions of L.T. switchgear (500 volts D.C.); 30-ton electric travelling crane; water-tube boilers, together with economisers, mechanical stokers, superheaters, induced draught plant, &c.; boiler feed pumps; extension of existing coal conveyor; steam and water pipe-work; water tanks; steel troughing and fixings for protection of cables in subway; annual supply of joint and junction boxes. Tenders will be considered from manufacturers only. Parties wishing to tender should communicate with H. Faraday Proctor, city electrical engineer, Temple Back, Bristol, who will furnish them with particulars as to the date on which specifications will be available.

Tenders.

Addressed postcards on which lists of tenders may be stated will be sent post free on application to the Manager, BUILDERS' JOURNAL, Great New Street, Fetter Lane, E.C. Information from accredited sources should be sent to "The Editor" at latest by noon on Monday if intended for publication in the following Wednesday's issue. Results of Tenders cannot be accepted unless they contain the name of the Architect or Surveyor for the work.

FIRE SUPPLEMENT (MONTHLY).

THE SAN FRANCISCO CATASTROPHE.

ALTHOUGH the great calamity that has befallen San Francisco is—in the first instance—due to a most lamentable earthquake, yet this disaster at San Francisco must necessarily rank among the great conflagrations of the world rather than among the great earthquakes; for although it is true the earthquake did quite considerable damage and caused much unfortunate loss of life, it is equally true that if the structural condition of San Francisco had even been of a moderately adequate kind, the fearful devastation of property that has taken place could not have occurred.

Whatever the great insurance companies may officially or unofficially intimate as to the great surprise of the losses incurred at San Francisco, there can be no doubt that their accredited representatives in the United States were fully aware of the conflagration hazard of that city, and can thus only have taken the large responsibilities that are now common knowledge either on account of competition or because of that strenuousness which so often induces the home management to look to large turnovers in premiums rather than to the risks at stake in certain American cities.

Any of the Older Schools

of insurance officials will tell the enquirer that "fire-prevention" is of no interest to their offices; that modern methods of construction or planning do not affect them; that they take "risks as they find them," and make rates accordingly to cover all eventualities. The risks which our insurance companies found at San Francisco, and which we assume they should have quoted for in a suitable manner, are perhaps best described in the summary of the National Board of Fire Underwriters' Report on San Francisco, published October, 1905, as one of the series of reports on the fire risks of the great cities of America. The summary of that report as to the conflagration hazard plainly states that "whilst two of five sections of the city into which the congested values district of San Francisco is divided involve only mild conflagration hazards within their own limits, they are badly exposed by the others in which all the elements of the conflagration hazard are present to a marked degree; not only is the hazard extreme within the congested value district, but it is augmented by the presence of a compact surrounding great-height, large-area frame residence district, itself unmanageable from the fire-fighting standpoint by reason of adverse conditions of topography. In fact (and here the italics are our own), *San Francisco has violated all underwriting traditions and precedent by not burning up. That it has not done so is largely due to the vigilance of the fire department, which cannot be relied upon indefinitely to stave off the inevitable.*"

The Board of Underwriters.

The National Board of Fire Underwriters who issued this report is representative, we believe, of all the best companies of Great

Britain, as well as the United States companies. The conflagration hazard described of course assumed the normal conditions of an important fire spreading, whereupon the conflagration hazard would be extreme. Such untoward circumstances as an earthquake causing the additional terrible risk of several fires starting simultaneously was of course not considered. The ordinary possibilities of a conflagration were only thought of, and yet this condemnatory report was issued and was public property. But nevertheless, regardless of the known risk, San Francisco was considered a popular insurance field, insurance business was keenly competed for, and the fact that the destruction of the city by fire was inevitable and quite clear to even the most unintelligent fire insurance man on the spot simply put aside. At home—i.e., at the head offices—the lack of interest in fire-prevention and the scientific aspects of fire-insurance prevented a brake being put on the scramble for business. Probably the results of the investigations conducted at San Francisco by the Board of Fire Underwriters was not even known at the head offices, or, if known, looked upon as exaggerated and being of a fire-preventive character not worthy of attention. Thus, there is really

No Reason to Condole

with our fire-insurance men on the subject of this loss, which must have been entered into with eyes open or without sufficient forethought.

The primary individual losers in this case, we believe, are the actual managers, who in their ambition for large turnovers have incurred such heavy loss for their companies. For them it means that the bonus with which their salaries are frequently supplemented will be materially reduced, if not wiped out, for the current year. That in itself, however, should be a salutary lesson for those who have been all too conservative in matters of fire-prevention and the scientific handling of fire questions; and it only remains to be thankful that our companies have substantial reserves, so that if the catastrophe does not find repetition elsewhere and the policy of fire-prevention is soon adopted by the offices no serious damage will have been done to British insurance prestige or to the shareholder who considers his holding an investment.

It is well known that the minority of insurance managers who take broader views is quite a small minority, and that their views are

Ridiculed by their Colleagues,

and, as we have stated on a previous occasion, it will probably still require some ten to twenty years and a few more conflagrations before a more enlightened policy of scientific fire-insurance takes the place of the present policy of rule-of-thumb and precedents. The increase of fire risk, not only in badly built American cities but in better-built cities at home, owing to the increased hazards of modern industries, has been quite underrated, and insufficient encouragement has been given for good building, careful equipment and painstaking management. Given that

encouragement, the property-owner would have been at greater pains to reduce the individual fire hazard, and thus the general fire hazard of localities would be gradually reduced likewise.

The architect and the builder will primarily realize the almost impossible position they have to take up when recommending clients to induce better forms of construction or equipment in their buildings, having regard to the lack of encouragement from the fire-insurance side. But as one of the leading fire-insurance managers (who has always had a sympathy for scientific fire insurance and fire research) indicated just eight years ago, after the Cripplegate fire, "the present generation of managers will probably have to die out before the offices officially realize that there is something in a fire-preventive policy from the insurance business point of view." As far as our opinion goes, we think that unless the majority realize this before 1910 the series of serious fire losses that must result during the first half of the current century will undermine the splendid insurance businesses that were created during the century just past. It is the old story so ably expressed by the Prince of Wales whilst at the Guildhall, on his return from his visit to Australia, of

"Wake up, England."

In many industries we have woke up, but only in quite individual and isolated instances is this the case in our fire-insurance businesses.

"It is an ill wind that blows nobody any good."

In the same way as the San Francisco catastrophe will, we believe, have done good to our insurance companies in encouraging them to more modern views, so, curiously enough, this catastrophe is good for the building specialist trade and our builders' merchants, who have had some very moderate years of business. There can be no doubt about it that San Francisco will be rebuilt, and, knowing the energy of its citizens, it will be rebuilt most rapidly. For this they will require more steel and more Portland cement than can be economically and rapidly brought to the spot overland from the American East. Thus British steel and British Portland cement will be required. In fact, we believe there will be such a demand that we shall feel the hardening of prices very soon in this country. Orders have already been also placed for specialties, such as slates, and British firms who have articles that can be easily shipped ought to make hay while the sun shines, not only in taking specific orders but in getting rid of surplus stocks.

Nature of the Fire Hazard at San Francisco.

As to the nature of the fire hazard at San Francisco we cannot do better than present plans and an official fire-insurance description of what the town was like prior to the catastrophe. This summarized description should be of interest to architects generally, but particularly to the architect and surveyor in municipal employment for the supervision of building construction. When the detailed reports from San Francisco reach

us we shall supplement this article by a second one, describing the actual effect of the fire on the various districts and upon individual buildings; but in order to realize the conflagration it is well to first of all know what the city was like.

San Francisco in Short.

Summarized, San Francisco is a city of 48 square miles within city limits, in which about 21 square miles are occupied by buildings. The population is about 4,000. The principal industries are foundries and machine shops, fruit-packing and preserving, breweries, slaughtering and packing, shipbuilding and sugar-refining.

The topography of the city is hilly, with excessively steep grades; streets only moderately wide, with few avenues. The winds are generally of high velocity, the prevailing direction being west. The fire-fighting facilities, both in the way of water-supply, fire alarms and fire-brigade management, were very fair. The building laws had no limits for cubic contents of individual hazard, and were unsatisfactory as to the materials for construction and the separation by party-walls. The regulations for the keeping of explosives and inflammables were moderately good.

Regarding the actual districts the following may be taken as a description:—

CONGESTED VALUE DISTRICT.

Limits.

East Street North, Washington, Davis, Jackson, Kearney, Pine, Dupont, Grant, Sutter, Powell, Post, Mason, Ellis, Taylor, Golden Gate, Jones, McAllister, Market, Seventh, Stevenson, Fifth, Jessie, Fourth, Mission, Third, Minna, New Montgomery, Natoma, Second, Minna, First, Natoma, Fremont, Mission and East Street South.

General Characteristics.

The area is about 314 acres, or about 0.49 square mile, containing 101 city blocks or parts of blocks. Values are fairly well distributed, being heaviest in the wholesale district, which lines Market Street on both sides from Steuart and Drumm to Second and Sansome Street and extends back to Mission on the south and as far as Commercial Street on the north, and

in the principal retail mercantile section, which is roughly bounded by Montgomery, Bush, Grant, Post, Stockton, Geary and Powell, and including both sides of Market Street west of Montgomery Street. The values in the foregoing districts are fairly heavy,

thinning out markedly towards the north above Commercial Street in the produce and commission house section, being practically insignificant in the few blocks fronting on East Street and fairly important and evenly distributed elsewhere.

South from the congested value district, and separated from it by a broad belt of low value but compactly built risks, is a very important warehouse, lumber and manufacturing district. It covers a large area and extends along the Southern Pacific Railway from the Bay of San Francisco to Eleventh Street, occupying both sides of the right of way for a distance of one to two blocks and, east of Eighth Street, extending as far south as Irwin Street.

An important wharf and warehouse district extends along the water front of the bay of San Francisco between King and Lombard Streets, containing at times very high values of merchandise and shipping, and adjoining the congested value district on the east but separated by East Street, which averages in width 175 ft.

Chinatown, bounded by Kearney, Pacific, Stockton, California, Dupont and Sacramento Streets, consists of nine rather compact blocks of one to four-storey small retail mercantiles, and adjoins the congested value district on the north-west for a short distance. The values contained are comparatively insignificant.

Stretching along the water front of the Bay from Greenwich to Taylor Streets, and extending back from one to several blocks, is an important manufacturing and lumber district which is well removed from the business district.

Other groups of considerable importance and representing noteworthy values are the group comprising the Union Iron Works, San Francisco Gas and Electric Co., Risdon

A SAN FRANCISCO SKYSCRAPER: THE HOTEL ST. FRANCIS.

PLAN OF THE GENERAL LOCATION OF SAN FRANCISCO.

Iron Works and the Western Sugar Refinery, bounded by Twenty-fourth, Illinois Street and the Bay, and the group of slaughter and meat packing-houses at the junction of Kentucky Street and Railroad Avenue. Both of these groups are well isolated.

CONFLAGRATION HAZARD.

Congested Value District. — General. — Bounded on the north by a mixed mercantile warehouse and dwelling section known as "Barbary Coast," and comprising the old part of the town; on the north-west by Chinatown; on the west by a fashionable boarding-house, apartment and residence section, mainly of frame construction; on the south by a compactly built mixed mercantile, dwelling and manufacturing district; on the east the Bay of San Francisco. For convenience the congested value district has been divided into five sub-districts, numbered consecutively, and described by their principal characteristic occupancy. They are described thus:—

First Section.—The principal retail mercantile section, bounded by Montgomery Bush, Grant, Post, Stockton, Geary and Powell, and including both sides of Market Street west of Montgomery.

Second Section.—The principal wholesale mercantile and light manufacturing district bounded by Steuart, Mission, Second, Sansome, Commercial and Drumm Streets.

Third Section.—The mixed banking, office and light mercantile section bounded by Market, Montgomery, Washington and Sansome Streets.

Fourth Section.—The produce and commission house district bounded by Battery, Washington, Drumm and Commercial Streets.

Fifth Section.—The hotel, rooming house, theatre and concert-hall section, consisting of the blocks north of Market Street and between Powell and Taylor Streets.

First Section.

The generally highly combustible nature of buildings and stocks, lack of improved risks and of protective devices on exposed openings, large number of exceptionally great areas and heights, frequent occurrence of large open light wells, absence of protection for floor-openings augmented by an unusually large amount of frame, often of considerable area and height, causes the probability feature of this section to be classed as very serious.

Second Section.

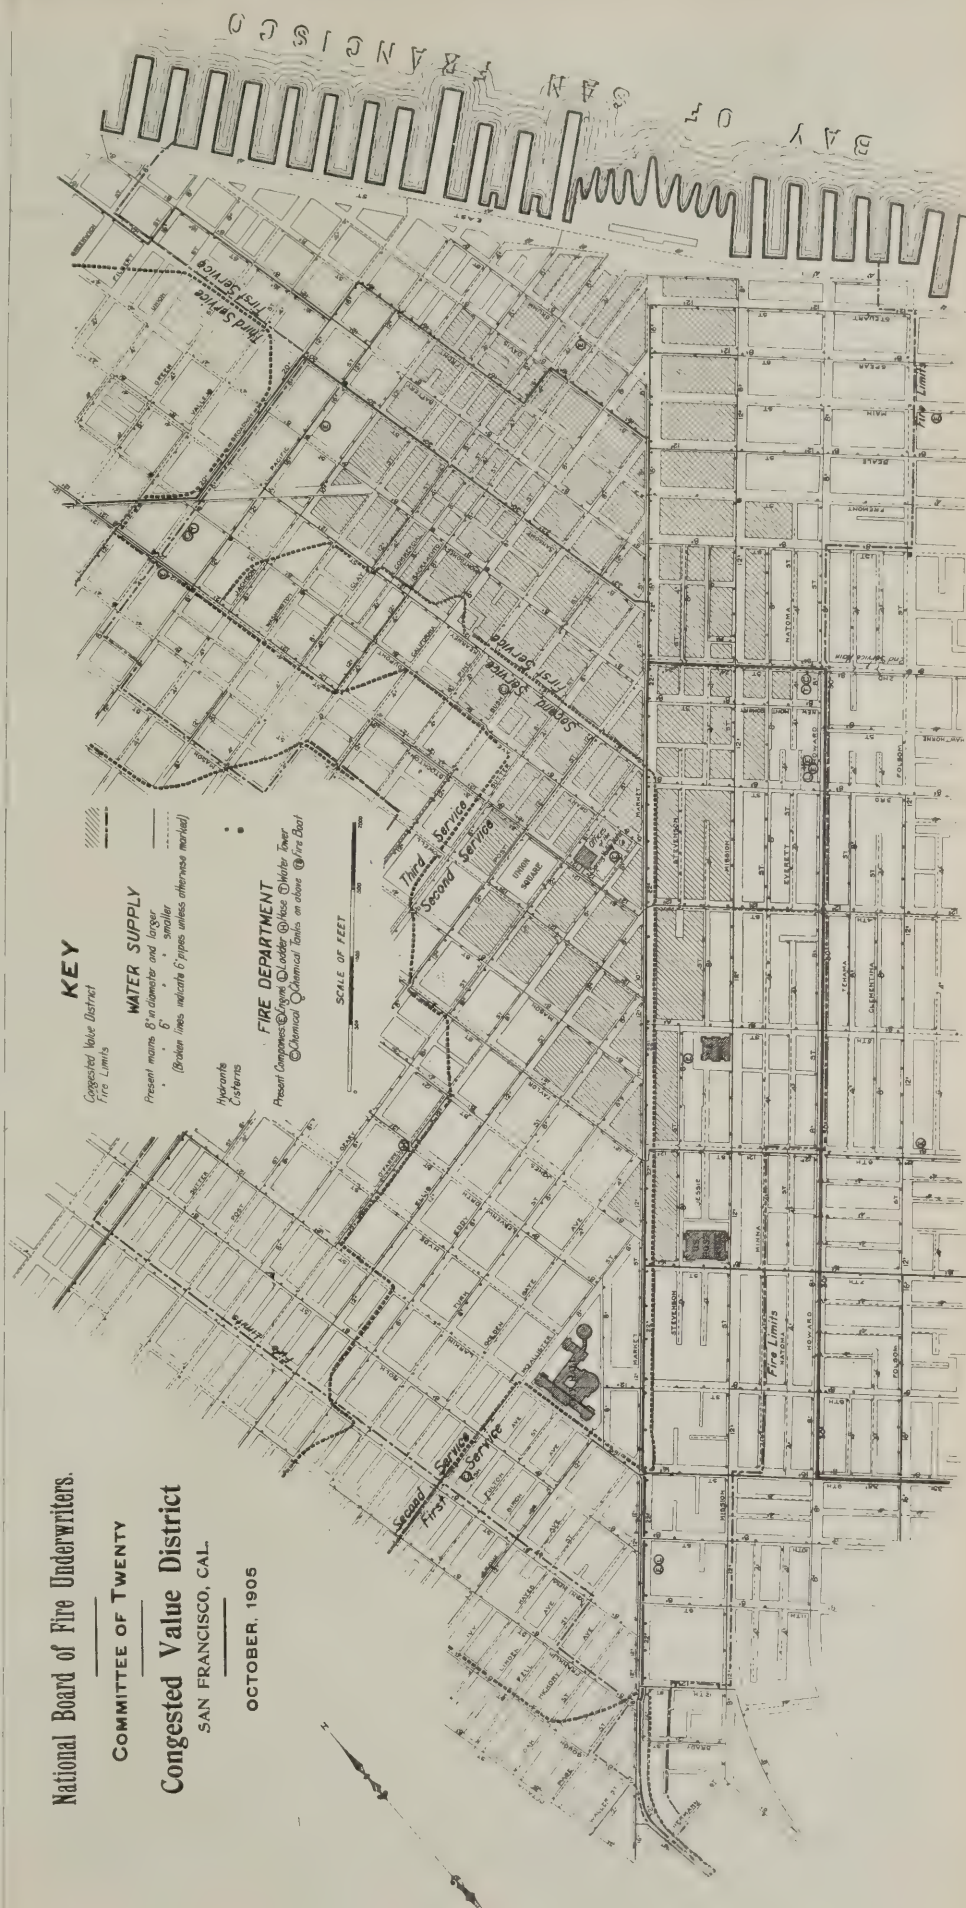

The prevailing type of construction in this section is ordinary joisted brick, wood-furred walls and sheathed ceilings being characteristic throughout. Considerable shutter protection exists, but is largely of an inferior type, inside shutters being common and generally hung on wooden frames. Some effort is made to enclose elevator and stair openings, but in most cases the enclosures are unsatisfactory. Interior open light wells are numerous, greatly increasing the individual hazard and making rapid fires possible. Slow-burning construction and protective devices universally lacking. The probability hazard is therefore very great.

Third Section.

This section is occupied principally as offices, with light retail mercantiles on the ground floor. A good many wholesale houses are located on Sansome Street, and the contents have considerable weight in considering the probability feature. The fireproofs are large and high, and although quite seriously exposed their modifying influence on local conditions is quite effective. The probability feature of the conflagration hazard in this area, while not excessive, is still considerable.

Fourth Section.

No serious conflagration breeders in this section. Heights generally low and areas

[From the San Francisco "News Letter."]

SAN FRANCISCO BEFORE THE FIRE: TELEGRAPH HILL SEEN FROM THE SPRECKEL BUILDING.

small. Buildings all of joisted construction and considerable frame construction obtains. Shutter protection more prevalent than in any other part of the city, and perceptibly modifies the general hazard. What exposures exist are not of a very serious nature. Streets mainly about 50ft. and 70ft. wide, and several blocks have internal narrow streets and alleys. In spite of the general absence of protective devices the probability hazard of this section is very mild.

Fifth Section.

This section contains more serious exposures, involving very large and highly combustible buildings and conflagration breeders than any other equal area in the city. The grouping of conflagration breeders in several blocks, in some cases adjoining, lack of shutter protection, presence of an exceptionally large amount of frame, frequent occurrence of bay windows on inside walls, roof elevations, and other undesirable conditions, make the probability hazard extreme.

Outside of Congested Value District.

First.—Mixed lumber, warehouse and manufacturing district extending from the Bay of San Francisco along the Southern Pacific Railway, and roughly bounded by Brannan Potrero, Sixteenth, San Bruno, Alameda, Eighth, Sixteenth, Hubbell, Seventh, Irwin Street (produced) and the Bay. Buildings are of brick and frame construction, but mainly the latter; party-walls are often blank and invariably parapetted to fair height; shutters quite extensively employed and several frame woodworkers and a few brick warehouses are equipped with sprinklers. Frame planing mills, box factories and other woodworkers are numerous, and commingled as they are with the lumber yards cause very grave conditions. Several blocks contain rows of these risks, closely grouped; and there are several areas, often involving a number of blocks, in which the potential feature is excessively high. Potential hazard very serious throughout. District is somewhat disconnected north of the railroad by blocks, or parts of blocks, of small dwellings and retail mercantiles. Streets of fair width and water-supply mostly fair, but decidedly weak in the lumber district south of the railroad.

While a conflagration involving the entire district is not probable the possibility of large fires occurring is very severe, and local conflagrations of serious proportions are imminent. The group, however, is well removed from the congested value district.

Second.—The lumber, yard, warehouse and manufacturing district extending along the water front from Greenwich to Taylor Streets is also well removed from the congested value district. Lumber yards are small and risks are strung out over a large area, and nowhere seriously grouped. Construction is all brick and frame, mainly the latter. One frame woodworker is sprinklered and one brick (a flour mill) is of fireproof construction. Streets of only fair width, and water-supply is very limited, at best only fair in some blocks. The probability of a serious conflagration occurring in this group is small owing to space isolation and the low height of the lumber piles.

Third.—The isolated group comprising the Western Sugar Refining Co., Risdon Iron Works, San Francisco Gas and Electric Co., and the Union Iron Works, bounded by Illinois Street, Twenty-fourth Street and the Bay. In this group are some immense values and the most important special hazards in the city. It covers a large area, and the two ironworks are fairly well separated from the other two plants by a very high hill. Several of the buildings in the ironworks section are constructed of non-combustible materials

throughout, many of the combustible buildings in the group are equipped with automatic sprinklers, and the whole area is well protected by a private distribution system supplied from three sources; and a high-pressure can be obtained by a large battery of fire pumps. Buildings mainly of brick joisted construction, and in places the space isolation is insufficient. In view of the good protection, practically fireproof nature of some of the buildings, and fairly good space isolation, on the whole, however, there is small probability of a large conflagration originating in this group.

Fourth.—The slaughtering house and stock-yards district consists of two groups well separated by an expanse of water several hundred feet wide located at the juncture of Kentucky Street and Railroad Avenue. Both groups are built on piles out over the water of the bay, and are entirely of light-joisted frame construction. Owing to the nature of the construction, poor water-supply and isolation, the conflagration hazard of this district is abnormally high, and the probability of a sweeping fire destroying the whole group is extreme.

Fifth.—The wharf and warehouse group extending along the water front from King Street to Lombard Street. These warehouses and docks are built over the water on piles, and, with the exception of the brick ferry depot, are all of frame construction and highly combustible. They contain at times very high values of merchandise and shipping. Obviously the potential hazard of the district is very great. Buildings, however, are mainly but one storey high, and although of great area are fairly well separated by open spaces forming the slips; and in view of the close proximity to the centre of the city and availability of a large amount of fire-fighting apparatus, fire tugs and individual protection resulting from an independent distribution system with a good supply of hose, a serious conflagration involving this district is not likely.

CONCLUSIONS.

The principal features affecting the conflagration hazard in the business section are bad exposures, poor construction, lack of proper protective devices, excessive height in non-fireproof buildings, large floor areas, and the large percentage of frame construction present.

Exposures both front and rear should be

eliminated by the adoption of proper protection on all unprotected openings which are exposed. The poorer and more hazardous class of buildings should gradually be replaced by a class of buildings designed with more attention paid to the fire-resisting qualities, and the present ones should be protected in the most effective manner. Measures should be taken to enforce or encourage the installation of sprinkler equipments and other protective devices in all buildings occupied for hazardous purposes and likely to become conflagration breeders from their size or nature of their construction and occupancy.

The adoption of these and other recommendations outlined in this report will greatly reduce the conflagration hazard of this city.

Frame Construction.

The construction outside the fire limits is almost wholly frame. Streets are mainly of good width, but only a few exceed 82½ft. The water-supply on the average is fairly good, but is decidedly weak in several highly-hazardous localities. The mixed dwelling and minor mercantile section which immediately surrounds the congested value district, and extends from it in all directions, with more or less uniformity, is alarmingly compact. These solid blocks of frames often contain four- and five-storey buildings, and the potential hazard is very serious throughout. The exposure to the congested value district is very serious and decidedly marked on the north and west, where the grouping of high-frame apartment buildings is common in the blocks adjacent to the limits of the mercantile district. The use of redwood in building construction and the dampness of the air are thought by some to reduce the conflagration hazard, but redwood is being used to a less extent for finish, and has not been used structurally at all, owing to its lack of strength. In any event, the security resulting from a combination of redwood and such dampness as exists in San Francisco is regarded by the National Board engineers as fancied merely.

An interesting Summary of the Model Theatre Fire Tests at Vienna was presented by Chief Officer Westphalen, of Hamburg, to the Hamburg Architectural Society, and this summary has been published in German with some exceedingly useful illustrations.

THE HILTON ANDERSON BROOKS AND COMPANY'S PORTLAND CEMENT WHARF FIRE.

A CEMENT WAREHOUSE FIRE.

THE fire of last month at Messrs. Hilton, Anderson, Brooks & Company's cement wharf, Upper Thames Street, London, E.C., which was notable for the excellent stop made by the fire brigade, had some interesting features. The warehouse in which it took place was an old-fashioned one, with all its metalwork unprotected and the flooring supported by wood joists. Upon this floor there was a very heavy load of Portland cement, stacked for the most part in bulk. The fire started somewhere near a lift-shaft and immediately spread to the rafters of one of the floors, as shown in the illustration. Fortunately there was no unprotected metalwork in the floor just above the lift-shaft, and the joists alone were affected by the flames. These, of course, rapidly charred, but fortunately not so rapidly but that the fire brigade were able to get to work to extinguish the flames.

Having regard to the fact that the putting of water on to this fire meant absorption of water by the cement and an increase of the load on the floor, it was a matter of the utmost interest how the water was got on to this fire in time to put it out and yet not in sufficient quantities to so load the floor below as to break it down.

Owing to the promptitude of the brigade, the damage was mainly water damage, the fire damage being quite small. Ten minutes' delay would probably have meant a collapse of the building.

The photograph shows the cement in bulk which, as a matter of fact, became an

enormous mass of neat cement-concrete for a layer of considerable thickness and set hard so that it had to be broken up by sledge hammers before it and the powdered cement under it could be cleared away.

Drenchers.—It may be remembered that we published some illustrations of drenchers provided at Dr. Jaeger's factory in London, with a view of assisting in the protection of the factory from external fire-risks. We are pleased to observe from a letter publicly issued by the manager that on the occasion of the fire at 58, Chiswell Street on April 25th the fire was apparently prevented from spreading into the Jaeger premises, although the distance between the fire and the latter premises was only 18ft.

FIRE TESTS.**LAST WEEK'S TESTS.****Reinforced Concrete Floors.**

ON Wednesday, May 2nd, the British Fire Prevention Committee continued its tests with reinforced concrete floors, the floor under investigation being one constructed on the Coignet system with the object of attaining classification as "fully protective" (Class B.), which requires a four hours test followed by five minutes of water, the load being $2\frac{1}{2}$ cwts. per ft. super. Slag concrete with "Ferrocrete" cement were used. There was a considerable attendance of Government officials, architects and surveyors. Without going into detail, pending the

issue of the report, it is generally known that the floor attained the full classification (B.). This was the second test by Messrs. Coignet a previous test having been for the period of three hours, in which classification as fully protective (Class A.) was attained, i.e., the $2\frac{1}{2}$ hours test was passed.

Protection of Window-openings.

Another test conducted on the same day was a rather interesting test as to the protection of window-openings, namely, a comparative test between wire-glazing in hardwood frames versus ordinary 32oz. glazing in ordinary deal frames protected by the roller shutters of the "Kinnear" type. This test will be dealt with later when the report is issued.

KINNEAR ROLLER SHUTTERS.

We publish two photographs of the interesting tests that were carried out with the Kinnear roller shutter doors. These tests, as Mr. J. Herbert Dyer, vice-president of the National Fire Brigades Union, writes in a preliminary note, "were intended to further illustrate the use of suitably constructed light steel revolving shutter doors in large vertical openings in checking the spread of fire where iron doors would be heavy and cumbersome. There were two tests:—

"(a) With a set of two steel rolling shutter doors fitted on either side of a 14in. wall, as for party-wall door purposes.

"(b) With a single steel rolling shutter door fitted on the inside of a 14in. wall.

"The double shutter doors withstood the four hours test, remaining intact and workable at the conclusion of the test, no flame having passed through or around them.

"The single shutter door withstood the $2\frac{1}{2}$ hours test, no flame having passed through or around it.

"Owing to the Committee's testing plant sustaining damage during the conduct of the tests, they had to be interrupted, whereupon water was applied on both sides of the shutters.

"The tests were subsequently continued, and the shutters which had already undergone an exceptional strain by fire and water were again subjected to fire, and at the conclusion to water under pressure with satisfactory results."

As to the object of test, the intended classification was respectively for full protection (Class B.), which means a four hours test, and for full protection (Class A.), which means a $2\frac{1}{2}$ hours test. The object was obtained.

The following is an approximate summary:—

The Set of Two Steel Rolling Shutter Doors.

After two hours the heat radiated through the shutters began to scorch a newspaper on a wooden post placed 12ins. (0'304 m.) away from the outer face of the outer shutter. After 2h. 45m. the newspaper and wood caught fire. No flames passed through or around the outer shutter or over the hood during the four hours of the test. Both the inner and outer shutters, frames and gear remained intact. The maximum bulge on the inner shutter at the conclusion of the test did not exceed 1 $\frac{1}{2}$ ins. (0'038 m.). The maximum warping to the hood protecting gear of the inner shutter did not exceed 3ins. (0'076 m.). The outer shutter retained its alignment. Both shutters could be easily worked and raised at the conclusion of the test.

Note.—The test was interrupted after 3h. 10m., owing to damage to gas producer. Water was applied after the interruption to the fire side of the inner shutter for $2\frac{1}{2}$ minutes (at about 65 lbs. pressure), and to the outer face of the outer shutter for $2\frac{1}{2}$ minutes (at about 45 lbs. pressure). This interruption with the additional application of water before the conclusion of the test were tests of an exceptional character beyond the require-

THE INNER SHUTTER OF THE SET OF TWO ROLLING SHUTTER DOORS AFTER TEST.

ments of the "objects of test." Owing to the interruption the temperature specified was not fully attained, but the additional test by water was considered to be more than equivalent to the non-application of the full temperature.

The Single Steel Rolling Shutter Door.

After the heat radiated through the shutter for some considerable time a newspaper on a wooden post placed 12 ins. (0'304 m.) away from the outer face of the shutter got alight. No flames passed through or around the shutter or over the hood during the 2½ hours of the test. The shutter and frame remained intact. The maximum bulge of the shutter at the conclusion of the test was 1½ ins. (0'038 m.) towards the fire side. The maximum warping to the hood protecting the gearing was 2½ ins. (0'063 m.). The shutter was worked and raised with difficulty to 4 ft. 6 ins. at the conclusion of the test.

Note.—The test was interrupted after 1 h. 40 m., as before stated, and the same additional application of water was made to either side of the shutter beyond the requirements of the "object of test" directly after the interruption. Owing to the interruption the full temperature specified was not attained, but the additional test by water was considered more than equivalent to the non-attainment of the full temperature.

CONCRETE FLOORS.

The object of the two experimental tests conducted by the British Fire Prevention

Committee was to obtain data in respect to the fire-resistance of concrete floors supported by broad flange beams, the light reinforcing joists not being secured to the beams by cleats, bolts or other mechanical means, *i.e.*, being held in position by the concrete between the wide flanges of the beams.

The idea was to see if such floors could obtain classification as being "fully protective" under the Universal Standards of 1903, *i.e.*, whether they would withstand fire (from below) for four hours at temperatures ranging to about and over 1,800 degs. Fahr., followed by water from a steam fire-engine for five minutes, the floors being loaded 2½ cwt. per ft. super.

The sections of floors under test were the largest tested anywhere in the world on the fire issue under the standard requirements, measuring 334 ft. super., the main beams being 15 ft. span.

The conditions, except for some minor points, were identical except for the concrete aggregate, and the tests were classed as experimental tests in respect to joist and concrete floors, as they are not subject to patents, the materials being generally available.

The principles adopted in the design and construction of the floor are explained below.

As to the results, they bear out in every way the conclusions already arrived at by the Committee that Thames ballast concrete is entirely unreliable as a fire-resistant. The failures have been successive and without

exception. The clinker-concrete stood remarkably well, and again bore out its excellent reputation. The tests on this large scale, following those on a smaller scale, will certainly naturally affect the building and fire regulations of the future as to the nature of concrete to be used in floors and for girder protection.

As to the floors under test, they measured 15 ft. by 22 ft. 3 ins., divided into three bays of 7 ft. span centre to centre, the main girders being the "broad flange" type provided by Messrs. H. J. Skelton & Co.

The Thames ballast aggregate was 2 parts of washed sand, 4 parts of unscreened washed gravel and 1½ parts Portland cement. The clinker-concrete was of 3 parts furnace clinker (¾ in. ring), 2 parts sand and 1 part Portland cement.

Comparison of the Results.

The following results are in tabular form from the Committee's official summary, and show the failure of the Thames ballast concrete and the success of the clinker-concrete floors. We have added extracts from Mr. Marsland's preliminary notes to the two reports:—

THE THAMES BALLAST CONCRETE FLOOR.

In 22 minutes after the commencement of the test the soffit of the concrete floor began to split off in patches, and continued to do so at intervals during the test.

In 75 minutes the whole of the concrete casing to lower flange of beam between south and centre bays fell.

In 100 minutes that to the beam between the north and centre bays fell.

The beams of the floor began to deflect in 20 minutes, and continued to do so more rapidly after the concrete to the lower flanges fell, till a maximum deflection of 7 ¾ ins. (1'8 m.) was recorded. Towards the end of the test the concrete to the north bay between the cross joists began to fall and the wooden floor on top became ignited. At the conclusion of the test the lower flanges of the beams were seen to be red-hot.

On the application of water more of the soffit fell, and eventually nearly the whole of the concrete between the cross joists in the north bay fell, the wooden floor on top igniting.

The maximum permanent deflection of the floor as recorded four days after the test was 4½ ins. (1'2 m.).

The concrete at the junction of the broad flange beams and the cross-joists did not crack or break. None of the joists were dislodged, twisted or bent.

Both fire and water passed through the floor, which was badly damaged.

THE CLINKER-CONCRETE FLOOR.

In 25 minutes after the commencement of the test small pieces of concrete began to split off soffit.

In 31 minutes two patches of concrete about 1 in. (0'025 m.) thick became detached from soffit of south bay and fell.

The maximum deflection recorded was 35 in. (0'88 m.) after 240 minutes.

On the application of water the surface of the beams was eroded where struck by the jet. (See illustrations.)

The soffits of the bays were also slightly eroded where struck by the jet.

On the load being removed the top surface of the wood floor was intact.

On removing the floorboards some of them were discoloured by the heat on the underside, and a wood strip at the south-west corner was charred.

Fine diagonal cracks on the top of the floor extending about 3 ft. were found at the south-west, south-east and north-west corners, also cracks on each side of the concrete over the tops of beams.

After the removal of the load it was found the floor was practically level and intact, and there was no permanent deflection.

Neither fire nor water had passed through the floor. Classification was obtained.

MR. MARSLAND'S NOTE.

This test demonstrates the unreliability of ordinary gravel or Thames ballast-concrete as a fire-resisting material at high temperatures.

It also demonstrates that with broad-flanged beams the connecting of the cross-joists to the main beams by cleats, bolts or rivets may be dispensed with when the concrete is carefully placed, but such construction exposes a wider flange to the action of the fire, which requires careful protection.

MR. MARSLAND'S NOTE.

It is interesting and instructive to compare this test with the former.

The floors were practically identical so far as their construction was concerned, the only difference being the aggregate of which the concrete to the bays and supporting beams was composed.

The test clearly demonstrates the superiority of clinker and coke-breeze over Thames ballast.

This test also again demonstrated with that broad flange beams the connecting of cross-joists to main beams by cleats, bolts or rivets may be dispensed with.

Design of the Floor.

The floor, which is not subject to patent or special rights, was constructed of materials generally available. The following particulars of the floor, and details explaining the:

THE SINGLE ROLLING SHUTTER DOOR AFTER TEST (KINNEAR TYPE), WHICH OBTAINED CLASSIFICATION AS FULLY-PROTECTIVE (CLASS A.).

THE CLINKER-CONCRETE FLOOR THAT OBTAINED "FULL" CLASSIFICATION.

SECTION AB

SECTION CD

DETAILS OF CONSTRUCTION OF THE THAMES BALLAST AND CLINKER-CONCRETE FLOORS.

principles adopted in its design, have been prepared by Messrs. H. J. Skelton & Co. —

1. The steelwork consisted of rolled steel "broad flange beams" and light reinforcing joists. The joists were not secured to the beams by cleats, bolts or other mechanical means, but were secured by the concrete held between the wide flanges of the main beams, this being the characteristic feature of the floor under test.

2. The floor was designed to carry a load, including the weight of the floor, of 392 lbs. per sq. ft.; this would give an average of about 20 tons on each of the broad flange beams. This load, according to the published properties of the section employed (viz., 10 1/4 ins. by 10 1/4 ins., of which the published Section

Modulus about $x \times x$ is 67 ins.³), is equivalent to an extreme fibre stress of approximately 7 1/2 tons per sq. in. for a beam supported at both ends and uniformly loaded.

The thickness of the concrete was fixed at a minimum of 5 ins., in accordance with building regulations. For the purpose of eliciting the required number and size of the reinforcing joists, the weight of the superimposed load alone was taken into account, the floor being assumed to carry its own weight. The joists were so spaced as to make the average load on each such as would impose an extreme fibre stress of 7 1/2 tons per sq. in. on the assumption of fixed ends. (Section Modulus about $x \times x$ 1835.)

In making this calculation the span was

measured in the clear, *i.e.*, between the edges of the flanges of the main beams, on account of the assumption of fixed ends, whereas the span of the broad flange beams was measured from centre to centre of the wall bearing at either end.

The weight of the steelwork in this floor, per bay, was 1,160 lbs., which works out at 11 lbs. per sq. ft. super. The extreme depth of floor was 14 1/2 ins.

3. As mentioned in the report, the ends of each steel beam were connected longitudinally to the adjoining beam by tie rods. It should be here pointed out, however, that the designers regard the provision of tie rods in this type of floor as unnecessary and of no advantage as regards strength.

THE THAMES BALLAST CONCRETE FLOOR THAT FAILED.

Rusting of Iron. SOME weeks ago we published several letters from Mr. Alan E. Munby in which he sought, by referring to the theory of Professor Dunstan and others that the rusting of iron was due to the presence of hydrogen peroxide, to refute our contention firstly that the ordinary rusting of iron was due primarily to the action of carbonic acid present in the atmosphere or in water, and secondly that the protection of iron by Portland cement and lime was probably due to the presence of alkalies which neutralize carbonic acid. We referred in our replies to the criticisms of Dr. Gerald Tattersall Moody, and expressed the opinion that these had fundamentally undermined Professor Dunstan's contention. Dr. Moody has now again returned to the charge, and the results of his investigations on the rusting of iron are communicated in a paper to the Chemical Society, and published in the journal of that body for April. Dr. Moody's evidence and arguments should allow no more room for doubt that the theory of rusting being due to the presence of carbonic acid is the right one, and that Professor Dunstan, his colleagues, and Mr. Munby are wrong. We cannot do better than use Dr. Moody's own words summarizing the result of his investigations: "The experiments recorded in this paper conclusively show

that oxygen is unable to oxidize iron directly in presence of water, but that when a minute quantity of carbonic acid, such as is contained in air, is present, absorption of oxygen takes place. The explanation of rusting as a process involving the production of hydrogen peroxide, as advanced by Dunstan, is refuted, not only by the complete indifference of iron towards oxygen in presence of water, but also by the composition of rust in actual formation and by the fact that hydrogen peroxide when free from acid does not oxidize iron. On the other hand, the ready interaction of iron and carbonic acid—which exists in all natural waters—resulting in the formation of hydrogen and ferrous salt, affords a satisfactory explanation of the first stages of rusting, which is followed by a more or less complete oxidation of ferrous salt by atmospheric oxygen, leading to the production of rust, the composition of which is variable and dependent on the extent to which oxidation of ferrous salt has taken place." Dr. Moody thinks that Professor Dunstan's work was nullified by the presence of carbonic acid in their apparatus, of the extreme difficulty of excluding which they do not appear to have been aware. Dr. Moody had difficulty in constructing and working an apparatus that would entirely exclude carbonic acid. When he succeeded he found that there was no rusting and no absorption of oxygen after a week's exposure to air and water almost entirely freed from carbonic acid, whereas when ordinary air and distilled water was used 94 per cent. oxygen was absorbed and the iron was badly rusted. Analyses were then made of iron rust from the unpainted interiors of iron flushing tanks in constant use, where of course the iron is under conditions specially favourable to rusting, the metal being alternately and in rapid succession exposed to air and water. Samples of this rust showed between 51 and 60 per cent. of iron present as ferric oxide, between 23 and 36 per cent. of iron present as ferrous oxide, and 8 to 12 per cent. present as ferrous carbonate. When powdered and exposed to air samples of the rust were found quickly to undergo further oxidation into the condition of ferric oxide. "The readiness with which ferrous oxide and ferrous carbonate on exposure to air undergo oxidation forming ferric oxide accounts for the low percentages of ferrous iron found in most samples of rust by previous observers." Dr. Moody calls attention to the assumption by Professor Dunstan that "by the interaction of iron, oxygen and water, twice as much hydrogen peroxide is liberated as is necessary to oxidize the ferrous oxide simultaneously formed. If hydrogen peroxide were actually formed in the ratio stated, ferrous oxide and ferrous carbonate would not be found in rust, since both these substances undergo immediate oxidation in presence of hydrogen peroxide." Dr. Moody draws the conclusion from

experiments that the iron dissolved by carbonic acid first exists as ferrous bicarbonate, which would remain in solution, but would precipitate in presence of air to ferrous carbonate, which again would regenerate carbonic acid by decomposing firstly into ferrous and ferric hydroxides and eventually into ferric hydroxide of iron alone.

Never too Late to Learn. It is very common to hear about the necessity of business and professional men keeping abreast of the times, making themselves conversant with all new developments, and discarding any of the older ideas or methods which may be going out of vogue. The professional man, however, seems inclined to leave the matter as an excellent maxim, no doubt, but one which somehow or other he hardly feels called upon to follow. Architects are apt to get into this mode of thinking. They begin well in the years of their early professional life, searching in all directions for fresh and further knowledge, and it is to be regretted that they do not more often preserve the flexibility of mind which enables them to assimilate new methods and fresh discoveries, rather than sitting down to the steady-going employment of the time-honoured methods recorded in standard textbooks which they had perforce to consult in their student days. A professional man especially should keep himself from becoming stagnant. It is not the boasted English conservatism to dismiss everything new without investigation, but rather to enquire into things carefully and hold back from adopting new methods only if there is a question of their efficiency or safety. Sooner or later, progress in construction is bound to result in changes in architectural form, as it has ever done in all ages and all countries during the past.

A Little Squabble. LAST week we pointed out how biased and unreal the majority of art criticism is, and we made a plea for something genuine. To that little homily we may now add a note on the way critics treat one another when they happen to disagree. The example is afforded by the "Saturday Review," wherein Mr. Pennell has a wrangle with Mr. MacColl about Whistler. He says: "And if membership in national societies and academies makes a man belong to national schools, Whistler was a Frenchman, a German, and an Italian, as well as what he described himself to be, a member of the American school." To this there is an editorial footnote (doubtless inspired, if not written, by Mr. MacColl) that "Mr. Pennell appears to forget that the fuss Whistler made about trifles was only rendered tolerable by his wit, and that when rudeness is employed as a weapon the weapon should at least have some point." Thus do the critics beguile the idle hours with sweet thoughts and honeyed words!

FIG. 4

EXAMPLES
OF TILERS' WORK

TILE-LAYING.

IN these days of easy transit, when material is as much a matter of choice in a building undertaking as the style and extent of the work, there is an ever-increasing danger of losing touch with the traditional methods practised by the old men, who formerly worked lifelong in perfecting methods of application for the materials ready to their hands.

Tiling has in this respect suffered grievously at the hands of the modern builder. It is now quite difficult to discover a man who can undertake the laying of tiles in other than a mechanical way; or, as the Building-Construction-Science-and-Art-Department-examination text-books usually put it, "the manner of laying is similar to slates."

The aim of the tiler in districts to which tiling is indigenous was to produce a water-tight roof without falling back upon the use of lead, any introduction of which was evidently felt to be an admission of incompetence. Incidentally, the result produced always showed a sense of breadth and suavity, with complete freedom from the hard angles formed by the mechanical intersections of hips and valleys on the modern principle. What the tiler would have thought of finishing his valleys, as is sometimes now done, with an open lead gutter to which the tiles are cut on either side to a neat line, it is difficult to imagine. His method of working round a valley is shown by Fig. 1. The valley is first fired up to an easy curve, sufficient to allow the battens,

when laid with a natural sweep, to meet with a right angle in the plane of their upper faces. This sweep causes each course of tiles when laid to curve upwards as shown. The system works best when the margin is about $3\frac{1}{2}$ ins. The dotted tiles "a" and "b" when laid would complete the topmost course shown of the roof-slope on the right of Fig. 1, and the next course to be laid on the left-hand slope would cover these, except for the corner immediately over the valley. These series of corners show alternately as indicated by the direction of the shading lines. It will be seen that this valley is completed without the use of any special tiles, without cutting, and without lead. Staple Inn, Holborn, is a prominent London example with valleys treated in this way, which, however, is exceedingly common all over the country, though seldom practised in modern work. The weather-proofing of hips and ridges is a matter of less importance than with valleys, since water does not run over them; only the rain actually falling on them being likely to percolate. The plain half-round ridge and round-ended hip tiles were practically universal before the last century, and it is at least gratifying to find most makers again manufacturing these patterns.

The intersection of dormers and other lower ridges with higher slopes affords another interesting example of the effort to exclude the plumber. The method is shown in Fig. 2. One length of common ridge-tile is inverted and bedded at the apex of the dormer ridge against the slope behind, forming a short cross-gutter to receive the water from above and direct it well out into the valleys on either side. At Dorchester, Oxon., many examples of this treatment may be seen, but it is not a usual method in most parts of the country.

Tile-hanging to walls and gables gave the workman another chance of exhibiting his resourcefulness. Fig. 3 shows the finish of tile-hanging under a verge. Two tiles at the end of each course are cut wedge-shaped (but retaining sufficient of their heads for nailing) in place of the one unmanageable triangular piece which usually occurs in this position (until it drops out) in modern work. The tiles are nailed into the joints of a gin brick-on-edge semi-hollow wall. This example was sketched at Winchester, where the method is common. Fig. 4 shows a simple treatment of the eaves by which all woodwork is entirely covered, a course of tiles laid flat forming a soffit. The roof tiles in this example are shown hung to feather-edged boarding, which is a method of hanging nibbed tiles cheaper than battens on boarding, and better than battens alone.

Verges are simply formed by laying a course of tile flat on the brickwork, projecting about 2 ins., and running the battens (or boarding) over same to within about an inch of the edge. After the tiling is laid, the wide open joint showing the ends of the battens is pointed up flush, forming the fine thick verge seen in old work. Great care is needed, however, to prevent the modern workman from colouring the pointing "to match the tiles"!

The perspective sketch shows most of the points explained in the diagrams, and also a characteristic treatment of the apex of a hip. In this the hip-rafters and longest pair of jack-rafters are taken, not up to the ridge, but into the last span just below that level. The tiny gablet so formed is often seen filled in with a black bottle-end.

Architecture over the Counter.—The following advertisement appeared in the "Daily Telegraph" last week: "Liberal commission paid to persons in a position to introduce clients to an enterprising firm of architects and furniture and decorative interior designers."

S.K. EXAMINATIONS IN BUILDING CONSTRUCTION.

IN an early issue we propose to publish the answers to the questions set at this month's examinations in building construction held by the Board of Education, South Kensington. Before doing so, however, we would venture a word or two of criticism on the questions set in Stage I.

Question 2.—This question might fairly be asked in almost any of the higher stages: only few persons have the opportunity of practical experience of *lias lime* to be able to answer at first hand "the precautions to be taken in its use." Thirty or forty years ago *lias lime* was much used for dock and other heavy walls, but nowadays Portland cement very generally takes its place.

Question 3.—"What are the essential properties of a good brick?" This might also be a higher stage question: the rest of the question, excepting perhaps "Blue Staffordshire," tests the memory of what one has read, and is not of much value.

Question 4.—A fair question to test powers of observation, not likely to have been very extensively answered, because such matters as common hitches are generally assumed to be altogether for the use of sailors.

Question 5 is the ordinary stock slating question, and it should have been almost universally answered: it is, however, questionable whether the maintenance of fancy names for slate sizes should be any longer encouraged.

Question 6 is a small concession to the elaborate bond drawings in the text-books.

Question 7 might be asked in any higher stage, if first-hand knowledge is expected.

Question 8 is a fair Stage I. question if the examiners will give credit for the ordinary joints one commonly sees, which are usually without any jointing material.

Question 9 may be fair if due consideration is given by the examiner to various interpretations of a $\frac{7}{16}$ in. by $4\frac{1}{2}$ in. sill. It may be taken to be either a window sill or a recess sill. "Weathering and throating" remove it from ordinary door sills.

Question 10 is a fair application of common-sense arithmetic in its first part; the balance of the question is fair.

Question 11.—It is not easy to see what it is intended to test with this question. No wood lintel as a rule should show on the outer face of a wall. The relieving arch should spring from beyond the ends of the lintel, and this is a reason for giving lintels short bearings: the permanent use of the lintel should be for the easy securing of the window or door frame; the sustaining of the small core underneath the arch is a slight duty. A wood lintel with long bearings is not a good form of tie.

Question 12 is a very easy one.

In the old papers of some years ago there would have been two or three questions in antiquated carpentry, framed floors and timber-roof trusses; but it is not well to ignore carpentry and joinery altogether as this paper does. In a paper which is supposed to be taken by many young people who are employed during the day in one or other branch of building, and in which power of selection is given, a fair balance should be attempted; in the present paper the carpenter and joiner has had no consideration. The architect's pupil has in his favour questions 1, 6, 8, 10 and 12; the slater has a question, and so has the mason and bricklayer; but the carpenter and joiner, the plasterer, the painter and glazier, and plumber (question 10 is quite a slater's question) have no special opportunity. Examiners would probably find that if they put practical questions they would get real information from their examinees, and in this way possibly it might result that the small text-books one sees on building construction might in time really give valuable information.

MANCHESTER NOTES.

The New Infirmary.

AT their meeting last week the Board of Management of the Manchester Royal Infirmary accepted the tender (£239,546) of Messrs. Arnold & Son, of Doncaster—who have done the foundations and built the basement floor of the new infirmary in Stanley Grove—for the building of the general superstructure, with the exception of some outer offices and details estimated at £63,000. The other tenders were as follows:—

Holliday & Greenwood, London	-	£258,277
Thomas Rowbotham, Birmingham	-	256,752
Foster & Dicksee, Rugby	-	253,520
Morrison & Son, Liverpool	-	251,300
R. Neill & Son, Manchester	-	245,000
Brown & Sons, Salford	-	244,480

Messrs. Arnold's tender is £4,934 lower than the next lowest of Messrs. Brown & Sons, and the contractors agree to complete the work by July 30th, 1908, or two months earlier than the stipulated time, by which £2,000 will be saved in interest.

Mr. Charles Hopkinson, as chairman of the Building Committee, said the figures included the work for Section A. This comprised the three large four-storey blocks and all the medical and general surgical departments. It did not include the lodges on the outside, the casualty and special block, nor the out-patients' block, the superstructure of the laundry, nor the superstructure of the septic and pathological block, nor the corridors. These were included in Section B. The estimate of the architects, Messrs. Edwin T. Hall, F.R.I.B.A., and Mr. John Brooke, A.R.I.B.A., for Section A was £240,000, and for Section B £63,000. The committee had not regarded price alone nor time alone. The tenders were asked for on the basis of finishing the work by September 29th, 1908, and by finishing the work he did not mean simply Section A but Section B as well; that was the complete hospital.

The Question of Local Labour.

As to local labour, a deputation had waited on them from the Carpenters' and Joiners' Society, who urged that it would be right and proper to spend two or three thousand pounds more in employing a local contractor, and thus ensure the employment of local labour. The committee, however, considered that Messrs. Arnold were giving them an advantage of £2,000 in the date of finishing as well as the advantage in cost. The architects had communicated with Messrs. Arnold as to the number of local men they could employ, and they had replied that if the work were placed in their hands they would employ all local labour with the exception of the foremen and the leading men in each trade, who would come from their permanent staff. It was their intention to work the whole of the large quantity of stone required in Manchester as far as practicable, and from 150 to 200 masons would be employed. In carrying out the foundations contract they had imported very few men, not exceeding 6 per cent, the remaining 94 per cent. being all local men. Messrs. Arnold added that as Manchester firms competed outside there was no reason why they should not compete here.

The total cost of the new infirmary is put at £436,000, including furnishing £22,000 (486 beds at £45 per bed), and commission of architects and quantities surveyor £22,600.

Refuge Assurance Co.'s Premises.

It is now eleven years since the late Mr. Alfred Waterhouse, R.A., brought to completion the building at the angle of Whitworth Street and Oxford Street, Manchester, which he designed as the chief office of the Refuge Assurance Co. The expansion of business during these years has rendered imperative an increase of accommodation, and the company has entrusted to Mr. Paul

Waterhouse, the son (and for many years partner) of their former architect, the task of continuing the building up to the arch of the Manchester, South Junction, and Altrincham Railway and the bank of the River Medlock. Such an extension, involving as it does an additional frontage in Oxford Street of more than 57 yds. and the occupation of an additional area of 2,208 sq. yds., is naturally something more than a mere annexe to the original building. In fact, the architect has realized that in the future the present block must serve as one wing of a composition on a larger scale, and with a view to preventing the monotony of an unduly prolonged frontage of uniform height he has emphasized the centre of the façade by a tower 217ft. high pierced at the base by a carriageway flanked right and left by minor archways for foot passengers. A perspective of the front is exhibited in this year's Academy.

WREXHAM SCHOOL COMPETITION.

MORE than 200 architects applied for the conditions of this competition, and about ninety sets of drawings were ultimately submitted. The assessor (Mr. W. E. Willink, F.R.I.B.A.) finally selected eight, and these were the only designs on view during the latter part of last week. This does not permit of a general commentary on the competition as a whole, owing to the eight designs exhibited being of one type of plan. Evidently the assessor discarded every scheme which did not follow on these lines. The conditions and replies to queries ought to have clearly stated that the playground in particular was preferred on the front of the site, as many excellent plans for this school must have been passed over owing to their disposition on the land. The com-

petition appears to have limited itself to the designs that placed the schools as a whole at the back of the site, with playgrounds and playsheds in front only.

Design placed First.

The assessor has awarded the first premium, £50, to Mr. Frederick Willey, of Durham. The accompanying block plan illustrates the arrangement of this scheme. An alternative tracing for the boys' and girls' departments on the corridor type was submitted, but it is understood that the central hall type is to be adopted. The plan is a good one as a whole, but is open to improvement when examined in detail. The teachers' rooms in some instances are not well shaped, and the cloak-room accommodation seems lavish. If sunlight rules the assessing, this scheme would not compare favourably with the second, having eight classrooms with a north-west aspect. It is, however, undoubtedly the best working plan for supervision. The elevations are plainly treated, though too much effort has been made to break up the front with gables to add interest to the composition. Had the author shown all his chimneys he would have discarded a great many of his gables, which have made the roofing very complicated, and would prove expensive if carried out as shown. The clock-tower is not in the centre, and does not appear to be in harmony with the grouping of the school buildings. The points of the compass are not very accurately drawn on the plans. If the school is to be erected at the cost of £12 10s. 10d. per head, according to the instructions, the elevations will have to be more economically treated and the heights reduced where possible. The building is to be erected on a hillside, and, judging from the levels, much excavating and filling-in will be necessary to level up the playgrounds and playfields.

Design placed Second.

The design awarded the second premium, £30, is by Messrs. Lumsden & Hardie, of Oxtou. This is an ideal plan for securing sunlight into all the classrooms, though the length of the corridors and splay-wings take away from the appearance of the scheme. The grouping of the buildings on the site has been well considered for architectural effect. The position of the cookery and manual instruction rooms is to be recommended for ventilation, but not for means of access from other departments. The elevations are well drawn and coloured. The position and levels of the playground and their means of access are the chief drawbacks to this otherwise clever plan.

Design placed Third.

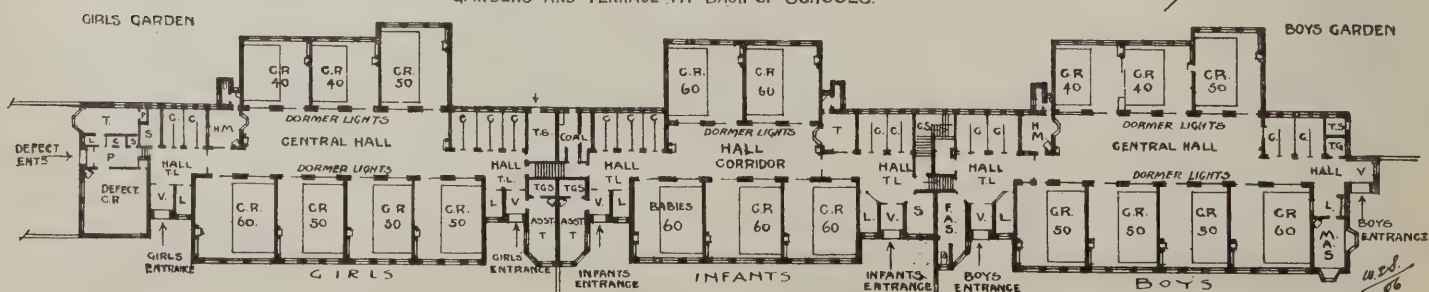

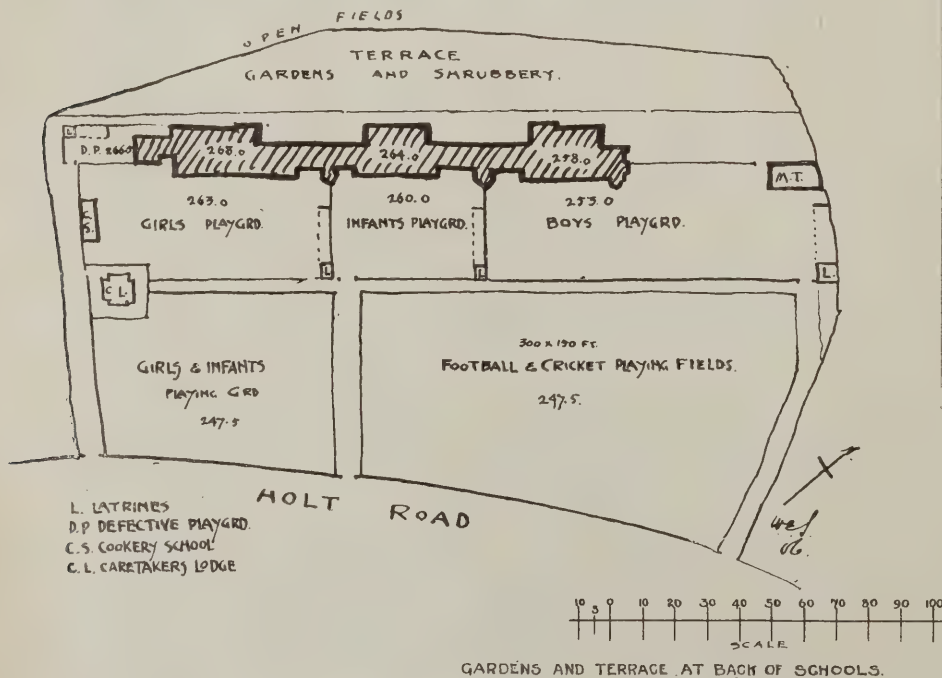

The design placed third, by Messrs. C. E. Deacon & Horsburgh and E. P. Hind, of Liverpool, has few points in its favour, either in plan or in elevation. In the infants' department it is almost impossible for the babies' and infants' classrooms to have sunlight, surrounded as they are by buildings on three sides. One central hall does duty for the boys' and girls' departments, and for this economical feature the infants' rooms have had to suffer both in light and ventilation. The playgrounds have received very little consideration. It is noticeable that a playshed and latrines will interfere with the direct sunshine for the infants' playground, especially when the latter is a few feet below that of the girls'. The elevations are drawn in brown ink in a sketchy manner and are very commonplace. The sections are also very hurriedly drawn. In no way is this design comparable with the first and second.

Other Designs.

One of the best schemes is that of Messrs. Marshall & Tweedie, of Newcastle. The buildings are set centrally on the site in a similar manner to the design placed third. This plan is much better; only the length of corridor is wasteful and the internal areas are a considerable drawback. The main front showed one of the best elevations exhibited.

Mr. C. T. Taylor, of Oldham, submitted a similar type of plan. Much thought was given to ensure sunlight for the classrooms.

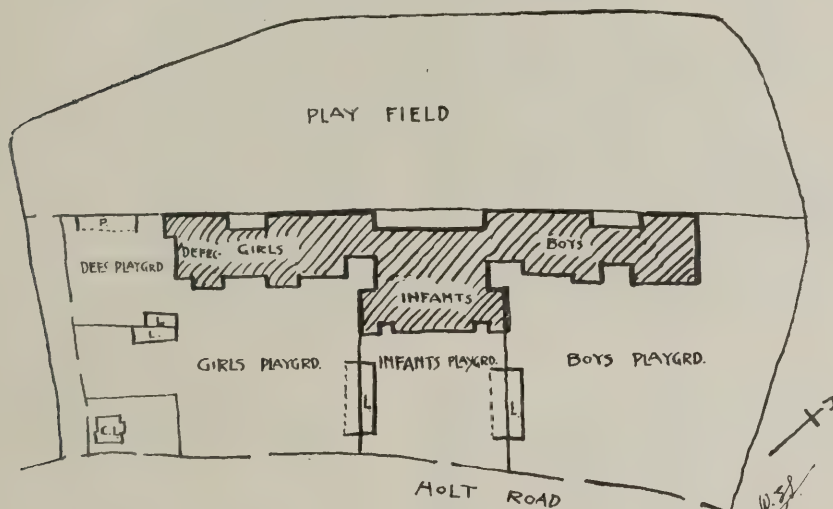

Two of the remaining designs are the work of a local architect, Mr. Walter Slater, of Wrexham, who evidently spent much time in turning out the laboured drawings, neatly drawn and highly coloured. The plans were not so well thought out. The school buildings in one scheme cut up the playground and intercept any communication with the conveniences at the back of the site and with the playsheds at the front; so that the only means of access is by re-entering the school.

WREXHAM COUNCIL SCHOOL: FIRST-PREMIATED DESIGN. FREDERICK WILLEY, ARCHITECT.

LUMSDEN AND HARDIE, ARCHITECTS.

WREXHAM COUNCIL SCHOOL: BLOCK PLAN OF THIRD-PREMIATED DESIGN.
DEACON AND HORSBURGH AND E. P. HIND, ARCHITECTS.

NOTES ON COMPETITIONS.

New Secondary School, Liverpool.

The Education Committee of Liverpool has issued an invitation to architects practising as principals in Lancashire and Cheshire to compete for a new secondary school for girls, to be erected in Aigburth Vale. Applications for conditions of competition are to be accompanied by a remittance of one guinea, which will be returned upon the receipt of *bona-fide* plans. Should this meet the eye of any intending competitors who have not yet applied for conditions, and who do not care to expend their energies in competitions which offer little beyond a sporting chance, the following quotation of the clause as to the adjudication of the designs may serve towards the saving of guineas which would otherwise be irreclaimable: "The Committee will themselves adjudicate upon the designs submitted, but they reserve the right to obtain professional and expert assistance in so doing, with a view to arriving at a decision." There have been sufficient instances of unhappy awards of late to warrant a cautious view being taken of clauses of this nature. It is worth while recalling that at Colchester and Bolton the services of an assessor were dispensed with; and the results were protests from competitors and dissension amongst the promoters. At Wallsend an assessor was engaged to

assist in the adjudication; the respective order of the three designs selected by him was ignored and the author of the third design was appointed to carry out the work. A similar result to either of these is possible in the present instance; it is therefore desirable that all who are interested will communicate with the town clerk and urge the immediate appointment of an expert assessor whose decision shall be acted upon. This has been done by some who have already obtained the conditions, as well as by the Competition Reform Society in the interests of its members within the prescribed counties. The effect may be as happy as was the case with the Southwark Library Competition, where the promoters yielded to a considerable amount of individual appeal and appointed an assessor, although they had originally intended entrusting the adjudication of the designs to a lay committee.

London's New County Hall.

In the annual report of the Council of the Royal Institute of British Architects there was a reference to the advice given by the Institute to the London County Council, recommending the institution of a combined open and invited competition for the new County Hall, to be judged by a jury of assessors. The discussion upon the report did not throw much light upon the method to be adopted, but one thing appears clear, viz., that the open and invited competition would be run upon

lines similar to those of the Hague Peace Palace. To ensure the very desirable inclusion of all eminent architects in the competition, an invitation would be issued to them, and it is reasonable to suppose that the invitation would include the promise of an honorarium. No objection could be taken to this course, for when a man has reached the top rungs of the ladder of fame he can hardly be expected to descend into the arena to cross swords with a few hundred aspirants after glory, unless a possible defeat is to be, by some means and in some measure, compensated for. There is good reason for believing that the Architects' Department at Spring Gardens intends, if possible, to carry out this important work itself. Without reflecting in any way upon the abilities of the members of the architectural staff, it is to be hoped it will not have the opportunity of executing a professional commission which belongs by right to the architect ratepayers of London, at least to be competed for by them. The point of economy is also an important one in so far as it concerns the cost of professional services, for it is undeniable—to anybody who knows anything of the cumbersome system which prevails in all branches of the L.C.C.'s service under present conditions—that the working expenses there are in excess of those in a private office.

Palace of Peace: Awards.

The following are the awards in the competition for designs for the proposed Palace of Peace at the Hague:—1st, £1,000, L. M. Cordonnier, Lille; 2nd, £750, A. Marcel, Paris; 3rd, £583, Franz Wendt, Charlottenburg; 4th, £416, Otto Wagner, Vienna; a prize of £250 to Howard Greenley and H. S. Olin, of New York, and another of £250 to Franz Schwechten, of Berlin. The winning design is in the style of the chateaux of Northern France, the main building being flanked by high towers. M. Cordonnier, the successful architect, is about forty-eight years of age, and has already carried out several important works. In 1885 he won the first prize in the competition for the Amsterdam Bourse.

Bangor University.

A limited competition is to be held for the design of new buildings for the University College of North Wales at Bangor, and the following five architects have been invited to compete:—Mr. W. D. Caröe, Mr. Henry T. Hare, Mr. Arnold Mitchell and Mr. A. Marshall Mackenzie—of London—and Mr. J. Francis Doyle, of Liverpool.

Coventry Municipal Offices.

The first premium, £50, in this competition has been awarded to Mr. T. F. Tickner, architect, of Coventry.

Competitions Open.

May	31	CHAPEL AND SCHOOLROOM AT MANSELTON, SWANSEA. Particulars from Mr. T. Roberts, 71, Brynhyfryd, Swansea.
June	26	NURSING AND CONVALESCENT HOME AT GLOSSOP, to cost £6,000. Premiums of £20 and £10. Particulars from Mr. T. W. Ellison, town clerk, Norfolk Chambers, Glossop.
"	30	ELEMENTARY SCHOOL AT EAST WEMYSS. Particulars from Mr. A. Watson Taylor, clerk to the School Board, East Wemyss, R.S.O., Fifeshire.
July	2	SECONDARY SCHOOL FOR GIRLS AT AIGBURTH VALE, for the City of Liverpool Education Committee. Limited to architects in Lancashire and Cheshire. Particulars from the Town Clerk, Municipal Offices, Liverpool.
"	4	SCHEME OF SEWERAGE AND SEWAGE DISPOSAL WORKS AT WARBINGTON. Premiums of £100 and £50. Particulars from Mr. J. W. Loader Cooper, clerk to the U.D.C., Queen Street, Emsworth.
No date		DETACHED AND SEMI-DETACHED HOUSES AT CLIFTONVILLE, BELFAST.—Premiums £700. Particulars from R. J. McConnell & Co., 51, Royal Avenue, Belfast.

Ground Plan.

A WEEK-END COTTAGE AT TRIMMINGHAM
FOR GEORGE JEWSON ESQ. RE
H.C. IBBERTSON F.R.I.B.A. ARCHITECT.
28 MARTINS LANE E.C. CAMBRIDGE & HUNSTANTON.

The leading idea of this cottage, which was planned to meet the requirements of a simple holiday life, is a single large room supplemented by a sheltered loggia. The loggia is approached directly both from the common room and the kitchen, and is used for meals in suitable weather. There are two rooms in the roof, and the bathroom is large enough to be used as an emergency bedroom. The walls are of red brick, partly rough-cast, and the roof is covered with Bedford hand-made tiles. The cost of the cottage was £578.

THE LONDON COLISEUM.

Mr. Matcham's Defence.

AT the adjourned meeting of shareholders in the London Coliseum held at Cardiff last Thursday some statements were made by and on behalf of the architect of the building, Mr. Frank Matcham, which deserve to be recorded in answer to Mr. Stoll's (see p. 252 of our issue for last week). Mr. Edward Nicholl, in his report on behalf of the committee of inspection, said Mr. Matcham had informed them that the statement that he had exceeded his estimate by about £50,000 was very misleading and likely to give him very considerable trouble and injure his business, "and in justice to Mr. Matcham we must say we have received a letter of explanation which is being considered by us."

Mr. Matcham himself stated at the meeting that the amount given in the report, £167,000, was somewhat misleading. He was not responsible for that outlay. He could assure the shareholders that his firm had certified to the extent of £120,682 as the cost of building, including decorating, upholstering and furnishing, and from that amount must be deducted £5,675 for extra work in connection with machinery. This left the sum of £115,000 for which he was responsible. The difference between this amount and the sum stated he had no control over, and he was in no way responsible for it.

A shareholder complained that the explanation was not explicit.

Mr. Matcham: The work was taken out of my hands for a time.

Asked who were the responsible men, Mr. Matcham replied: The electrician and engineer appointed by the directors, and the directors themselves. The work connected with the stage machinery and the electric lighting was taken out of my hands, and I had no control over it. The engineer who carried out the work was appointed by Mr. Stoll.

A Shareholder: At your suggestion?

Mr. Matcham: Decidedly not. We wanted to do the work. Our firm wanted the work to pass through our hands.

Is that usual?

Mr. Matcham: Ordinarily the machinery of the stage would hardly come in our province, but we wanted the work. The only commission I have received is the amount of £2,500.

A Shareholder: Are you claiming any extra commission?

Mr. Matcham: I claim 5 per cent. on the value of the work which passed through our hands, £12,200.

A Shareholder: We have been given to understand that you have claimed on a larger amount, and that on your claim counsel's opinion has been taken.

Mr. Matcham: I do not think we have heard the result of counsel's opinion.

Mr. Carey: I feel I must rise on this question. Mr. Stoll, the managing director, wrote to Mr. Matcham, and our solicitors wrote to Mr. Matcham, calling his attention to the facts, and urging him to keep within the bounds. We consulted our solicitors in regard to the claim of Mr. Matcham, and took counsel's opinion. It was of such nature that we felt we could not proceed with the claim at all. I am sorry to in any way dispute Mr. Matcham's word, but his explanation is entirely wrong. Mr. Stoll, the managing director, told you at the last meeting that Mr. Matcham unfortunately had a serious illness, and in every possible way we, as directors, tried to keep within bounds. In regard to the mechanical stage, of course that is another matter concerning Mr. Stoll himself. It was a pet idea, directly the work of an electrician. In every possible way the directors tried to shield the company and keep down cost.

Mr. Matcham: All I can say is that the directors had the contracts laid before them for acceptance before the work was carried out.

Mr. Stoll said he had no reason to deviate from his previous statement, except in one respect. The architect's commission was included in the amount of £67,000 mentioned. He did not think Mr. Matcham's statement at all satisfactory.

A Shareholder (to Mr. Matcham): In regard to the estimate of £100,000 in the prospectus, have you made any claim for work which exceeded your estimate?

Mr. Matcham: No.

Mr. Stoll: Mr. Matcham has made a claim for the amount of work which passed through his hands and which, according to his own words, is shown at £121,000, against £85,000.

A Shareholder: There is a great discrepancy between your answers and Mr. Matcham's.

Mr. Stoll: If Mr. Matcham does not claim the amount, we will take the disputed point as settled.

Mr. Matcham: Really, we have not sent in our account yet.

Mr. Stoll: But there have been a good many letters asking for payment.

It was decided that the company should be wound up voluntarily.

Enquiries Answered.

The querist's name and address must always be given, not necessarily for publication.

The services of a large staff of experts are at the disposal of readers who require information on architectural, constructional or legal matters.

Stencil Patterns.

GILLINGHAM.—ALPHA writes: "Where can I obtain a booklet of stencil patterns or of designs suitable for decorating the walls and ceilings of a large chapel?"

We do not know of any book giving just what you require. You would do best to consult the various books on design and decoration given in our "Book List No. 2."

Building Work in Egypt.

LONDON.—WORKS writes: "There is a possibility of my obtaining an appointment in Egypt as foreman or clerk of works, and I should like to ascertain the conditions under which a man works there. Am I right in supposing that the labour is mostly black, and is the method of building anything akin to the English mode? Is the climate a comfortable one? I should also like some idea of the clothes necessary, the sort of food general to the country, and also as to approximate cost of living in, say, Khartoum or Fort Sudan, and whether it is usual to provide dwellings for the staff."

Building work in Egypt is carried out in the same way as in this country. Appointments for positions under Government are made from the Government offices in Queen Anne's Chambers, Westminster. Whether or no houses are provided for the staff depends upon the importance of the appointment, junior appointments generally being accommodated in this way, and the higher appointments left unprovided. There are English contractors in Cairo and Alexandria, but we do not think there are any in the Sudan; the contractors there are Germans, Italians and other Europeans, who employ native labour, and carry out work according to their own methods. The climate varies in different parts of the country, but is generally equable, being, of course, very hot in summer. It is impossible to give any general figures as to cost of living, as everything depends on particular circumstances.

The Metre Scale.

LEITH.—METRE writes:—"I send drawing of a metre scale (not reproduced). (1) Do all the figures 1, 2, 3, &c., on one edge represent centimetres? (2) Is this scale the natural scale, i.e., full size? (3) What is the scale on the other edge marked $\frac{1}{50}$ at one end and $\frac{1}{200}$ at the other? (4) In drawing a plan to $\frac{1}{8}$ in., $\frac{1}{4}$ in., $\frac{1}{2}$ in., 1 in., $1\frac{1}{2}$ ins., or 3 ins. to the foot, what would be the corresponding metre scales?"

(1) Yes. (2) Yes. (3) $\frac{1}{50}$ and $\frac{1}{200}$ of a metre. A centimetre is $\frac{1}{100}$ of a metre. The $\frac{1}{50}$ is 2 centimetres to the metre; the $\frac{1}{200}$ is 5 millimetres to the metre. (4) The answer depends on the exact meaning of this question. The English scales do not correspond with the metre scale, and a house drawn out to an English scale cannot be transposed into the metre scale. It must be redrawn. If, however, it is desired to know the scales usually employed by French architects, the scale corresponding to our $\frac{1}{8}$ th scale would be 1 centimetre to the metre, and so on: details full size and 10 centimetres to the metre.

Building Line.

Referring to the enquiry under this head on p. 249 of our issue for last week, "Surveyor" writes: "Before your correspondent finally refuses to keep to the line suggested or ordered by the local authority he should first ascertain if there is a Private Act which they are working under. Such an Act may give them power to define a line where the building line is very irregular, with the result that they are keeping new buildings in the rear of what would be permissible if the Act of 1883 is all that is relied on. Any Private Act should be read to see what compensation is due to owners, and how such compensation is to be obtained."

Obituary.

Mr. George Low, F.R.I.B.A., of London, died on May 2nd, aged 82.

Mr. Edmund Woodthorpe, F.R.I.B.A., F.S.I., surveyor for the northern district of the City of London, died on May 3rd at Hampstead, aged 47. Mr. Woodthorpe was an M.A. of Oxford.

R.I.B.A. Fellowship.—A special general meeting of the Institute is to be held on Monday next, May 21st, to receive the report and recommendations of the Fellowship Procedure Committee. The chairman will move that the regulation under by-law 9 be amended so as to read as follows: "The voting papers, which shall be in the form of the voting papers issued for the election of the Council, shall state the name and address of every candidate, with the names of his respective proposers, the year in which he was articulated, and, in the case of a candidate for Fellowship, the year in which he became engaged as a principal in the practice of architecture."

R.I.B.A. Examinations.—The Royal Institute of British Architects have decided to grant exemption from their intermediate examination to students who have satisfactorily passed through the four years' course of the Architectural Association schools; also to accept the school or leaving certificate of the Oxford and Cambridge Schools Examination Board in lieu of the preliminary examination, provided that the certificate includes all the subjects of the latter examination; also to empower representative South African societies to grant exemption from the preliminary examination on presenting certain certificates, to be approved; and also to hold the intermediate examination in South Africa.

VILLAGE CLUB
SANDON STAFFORDSHIRE
E. GUY DAWBER ARCHT.

OF THE
UNIVERSITY OF ILLINOIS

(For particulars see next page.)

VILLAGE CLUBS.

THE village club at Aston-sub-Edge, Gloucestershire, illustrated on the preceding page, is built of local stone, with brick chimneys, and covered with a stone slate roof. It contains a general reading-room and a small room. The building was erected for the estate under the superintendence of Mr. T. W. Knowles.

The club at Sandon, Staffs, is rough-cast, with a tiled roof. The whole of the wood used in its construction is of oak from the estate. The building contains a large gymnasium with dressing-rooms, and a reading-room, and on the first floor a billiard-room. It was carried out under the superintendence of the estate clerk of works, Mr. East. The architect of both clubs is Mr. E. Guy Dawber, F.R.I.B.A., of London.

Notes and News.

Newcastle Clerks of Works and Builders' Foremen's Association.—At the recent annual meeting Mr. T. Pigg was elected president and Mr. Bennison vice-president.

A New County Court for Westminster is to be built by the Treasury on the site of the old premises in St. Martin's Lane. Work will be commenced next August.

Mr. P. H. Thoms, president of the Dundee Institute of Architects, has been specially elected a Fellow of the R.I.B.A., under the proviso to by-law 9.

A new Building Estate is being developed at Beech Hill Park, near Barnet, and a number of eligible plots are to be offered for sale on June 12th by Messrs. Debenham, Tewson & Co. (See p. xix of this issue.)

Contract for Liverpool Cathedral.—The contract for the erection of the superstructure of Liverpool Cathedral has been let to Messrs. Morrison & Sons, builders, of Wavertree, Liverpool, who have carried out the foundation work. Only the chapter house, the Lady chapel and the choir and transept will be proceeded with at present. It is anticipated that the Lady chapel and chapter-house will be ready in about five years, but the choir will take a much longer time.

International Congress of Architects.—It would greatly facilitate the arrangements now being made by the Executive Committee if members of the Institute who intend to take part in this Congress, which is to be held in London during July, would signify their intention of doing so as early as possible. Subscriptions, £1 (subscribing member), £4 (donor) and 10s. (lady), should be made payable to "The Secretary, Seventh International Congress of Architects," 9, Conduit Street, W.

Swedish Timber: Government Bill to Limit Purchases of Forest Land.—A Bill has just been passed by the Swedish Government limiting the rights of large timber companies to purchase extensive tracts of land in the forest districts of Northern Sweden. Under the old conditions the timber was felled on a very large scale more with a view to immediate profits than to the proper working of the forest lands, and the extension of agriculture in those districts was thus materially hampered.

Messrs. Mellowes & Co., Ltd., of Corporation Street, Sheffield, have secured the order for glazing on their patent "Eclipse" imperishable system the roofs of Messrs. Vickers, Sons & Maxim's works at Sheffield; Messrs. Cammell, Laird & Co.'s at Sheffield; Messrs. Ransomes & Rapier's at Ipswich; the Sherwood Colliery Co.'s premises at Mansfield; the Birmingham Railway Carriage and Wagon Co.'s works at Smethwick; and the Buchanan Street Station of the Caledonian Railway at Glasgow: also warehouses in Brazil.

Mr. H. P. Monckton, F.R.I.B.A., has been elected a member of the City Corporation.

Surveyors' Institution, Junior Meetings.—At the junior meeting held at the Surveyors' Institution on May 7th a paper on "The Fiscal Burdens on the Land and Taxation of Site Values" was read by Mr. Cyril H. Donne. The members of the Law Students' Debating Society were invited to attend. The paper was followed by a keen discussion. At the conclusion of the meeting a special vote of thanks and of appreciation of his services was accorded to Mr. Sydney A. Smith, the retiring hon. secretary. At the annual general meeting, held prior to the ordinary meeting, Mr. C. H. Dinwiddy was appointed to succeed Mr. Smith as hon. secretary. The dinner will be held on May 16th.

Birmingham City Surveyorship: Selection.—Out of fifty-three applicants for the post of city surveyor at Birmingham Mr. Henry E. Stilgoe, borough engineer and surveyor to the Dover Town Council, has been selected by the Public Works Committee, who recommend the City Council to appoint him to the position at a salary of £1,250 per annum. Mr. Stilgoe is thirty-nine years of age, and he has held his present appointment at Dover for upwards of eleven years. He is a member of the Institution of Civil Engineers, a vice-president of the British Association of Waterworks Engineers, a member of the Incorporated Association of Municipal and County Engineers, and a member of the Royal Sanitary Institute.

Views and Reviews.

The Weathering of Stones.

The title of this book may seem somewhat unpromising to the student of building construction, but it contains a vast quantity of most valuable information. It is, of course, an American book, but the information which is given respecting the formation and effect of weather upon stones both here and in other countries is most useful. The advice has often been given that before deciding upon the use of any particular bed or quarry the effect of the weather upon its exposed surface should be noted. This book shows how we may elicit information from such natural weather surfaces. Of course it does not follow that the stone which weathers well in the open country will weather well in towns, but there is no doubt much to be gained from an examination of the weathered surfaces of rocks. The geology, too, which architects ought to study both in its relation to the formation of stones and the nature of soils, is so largely dependent upon the disintegrating action of natural forces that this book deals with a branch of study which is of the utmost importance to an adequate grasp of the subject. Crystallography and chemistry are the other branches which are embodied in the study of geology, but this book, although it refers extensively to these branches, is only concerned with them as they affect the decay and weathering of the rocks, and not so much with their formation.

"Rocks, Rock-Weathering and Soils," by George P. Merrill. London: Macmillan & Co., Ltd., price 17s. nett.

Painting.

This little volume is one of the useful series of technical-instruction manuals which Messrs. Cassell publish. The bulk of the matter contained in it was contributed by Mr. William Fourniss, late examiner of painters' and decorators' work to the City and Guilds of London Institute. The book is quite simple in character, and deals with the subject in an easy way, understandable by the veriest tyro. The tools are dealt with and the materials, followed by painting by machinery and useful chapters on preparing surfaces for painting, painting woodwork, ironwork, stucco or plaster, dis-

tempering and whitewashing, colour combination, house-painting, varnish and varnishing, stains and staining, and the estimating and measuring of painters' work. We wonder why all books on painting are so inaccurate in their treatment of colour combination. The question is a scientific one, which must be somewhat difficult for the ordinary person to understand, but it cannot be accurately explained without scientific treatment, and this book is only another addition to the many which inadequately deal with this branch of the subject. Apart from this, however, the book is an excellent one.

"Practical Painters' Work," edited by Paul N. Hasluck. London: Cassell & Co., Ltd., price 2s.

NEW LONDON BUILDINGS.

AT yesterday's meeting of the London County Council the Building Act Committee reported the following applications under the London Building Act, 1894, their recommendations as to consent or refusal being appended in *italics*:—

Five gate piers at the entrances to the South Eastern Hospital, on the western side of Avenley Road, New Cross Road, Deptford, on the application of T. W. Aldwinckle & Son, on behalf of the Metropolitan Asylums Board. (*Consent*.)

Bay windows in front of Nos. 13, 15, 17 and 19, Glen-shiel Road, Eltham, on the application of J. J. Bassett, on behalf of A. Cameron Corbett. (*Consent*.)

Retention of porches in front of Nos. 13, 14, 15, 16, 17 and 18, Kuskin Walk, Herne Hill, on the application of R. E. Mayo. (*Consent*.)

Retention of an iron and glass porch in front of No. 40, York Road, Lambeth, on the application of Ohlson & Sons, on behalf of Mr. Hitchcock. (*Consent*.)

Re-erection of Lansdowne Hall, Canterbury Grove, West Norwood, on the application of W. G. Scott, on behalf of Rev. Fuller Gooch. (*Consent*.)

Re-erection of buildings on the south-western side of Garratt Lane, Wandsworth, with flank walls abutting on the north-western and south-eastern sides of Kostella Road, on the application of W. Bartholomew, on behalf of P. C. Newman and C. Newman, junr. (*Consent*.)

Buildings on the northern side of Pentonville Road, to abut also upon Winchester Street, on the application of C. E. Pettit, on behalf of T. Lilley and Lilley & Skinner, Ltd. (*Refusal*.)

Projecting one-storey shops in front of Nos. 5 and 7, Flaxman Road, Loughborough Junction, on the application of Binns Brothers. (*Refusal*.)

Adaptation for carriage traffic of Jerome Place, Hillingdon Street, Walworth, and the erection of buildings at less than the prescribed distance from the centre of the roadway of Jerome Place, on the application of Gledhill Brothers. (*Consent*.)

Modification of the provisions of that section with regard to open spaces about buildings, so far as relates to the proposed erection of a block of dwellings on the western side of Rupert Street, Whitechapel, with an irregular open space at the rear, on the application of R. W. Hobden, on behalf of Hickman, Ltd. (*Consent*.)

Projecting one-storey shop in front of No. 210, South Lambeth Road, Kennington, on the application of F. E. Williams, on behalf of J. Hill. (*Refusal*.)

Extension of the period within which the erection of warehouse buildings on the north side of Great Arthur Street and south side of Bayer Street, Golden Lane, was required to be completed, on the application of Joseph & Smithem. (*Consent*.)

Deviation from the plans approved on March 20th 1906, for the construction of an iron gangway to connect Hay's Wharf and Wilson's Wharf over the public right-of-way leading from Battle Bridge Lane to Battle Bridge Stairs, Rotherhithe, so far as relates to an alteration in the position of the gangway, on the application of the proprietors of Hay's Wharf. (*Consent*.)

Extension of the time within which the roadway of a proposed street for carriage traffic to lead from Francis Street to Coburg Row, Westminster, was to have been clearly defined throughout by posts and rails, or so otherwise as the Council should permit, and thrown open to the public as a highway, on the application of R. B. Grantham & Son. (*Consent*.)

Extension of time within which the roadway of a proposed street for carriage traffic to lead from Wimbledon Park Road to Granville Road, on the Wimbledon Park Estate, Wandsworth, was to have been clearly defined throughout by posts and rails, or so otherwise as the Council should permit, and thrown open to the public as a highway, on the application of Glasier & Sons. (*Consent*.)

Bay window on the space at the rear of block "P" of the Peabody dwellings, Peabody Square, Blackfriars Road and Webber Street, Southwark, on the application of R. Robertson, on behalf of the Housing of the Working Classes Committee of the Council. (*Consent*.)

The Theatres and Music Halls Committee also reported the following:—

Drawing submitted by F. Matcham & Co., showing a new engine-room proposed to be erected at the Holborn Empire, Holborn. (*Consent*.)

Drawings submitted by F. H. Payne showing the proposed arrangements at Olympia, Addison Road, Kensington, during the exhibition of the Society of Motor Manufacturers and Traders, Ltd., to be held in November, 1906. (*Consent*.)

HOUSE AT CHRISTCHURCH PARK, SUTTON, SURREY. H. D. SEARLES WOOD, F.R.I.B.A., ARCHITECT.

This house was designed to give as many of the rooms as possible the benefit of a south aspect. The materials are red bricks, rough-cast, and Reading tiles.

THE LATE MR. GARNER.

An Appreciation.

THE sad and unexpected death of Mr. Thomas Garner, which took place on the last day of April at his beautiful old house—Fritwell Manor—in Oxfordshire, has brought to a close the career of a distinguished architect whose unfailing industry, conspicuous talent and single-minded devotion to his art merit something more than a passing notice.

Born in 1839 at Wasperton Hill, in Warwickshire, and reared amidst the old-fashioned and simple surroundings of a remote rural district, Thomas Garner imbibed the natural hearty country instincts which became a part of his nature, and were never blunted or diminished during many years of residence in London, and before the long-hoped-for return to the country was realized by his establishment in the fine Jacobean Manor House at Fritwell. To his country education he owed the love of riding and the excellent horsemanship which he retained to the last.

Mr. Garner was articled to Sir Gilbert Scott at the early age of seventeen, and served, with the energy and enthusiasm that never left him, as one of the many pupils of that architect. Amongst his contemporaries in Sir Gilbert's office, many have risen to distinction; we may instance Mr. T. G. Jackson, R.A., Mr. Micklethwaite (architect in charge of Westminster Abbey), and Mr. Somers Clarke, who has the care of St. Paul's Cathedral. Mr. G. F. Bodley, R.A., whose partner he was destined to become, just preceded him at Scott's office, but a warm friendship was soon established between the senior and junior. On the

completion of his articles Mr. Garner returned to Warwickshire, and was responsible in his first few years of practice for various works on his own account, or as representative of Sir Gilbert Scott. Mr. Garner returned to London about the year 1868 to assist his friend Mr. Bodley, who was rapidly coming into note, and who found himself somewhat over-burdened with work. The assistance soon grew into the partnership, which was to last for more than twenty-five years, and which ceased by the friendly dissolution of a friendly bond about the year 1897. For a time the collaboration of the partners was actual and close, but as work increased upon their hands it became their habit to individualize, each partner assuming the entire and separate responsibilities for definite work. The earlier period of close collaboration produced some remarkably successful results, none perhaps more notable than the fine churches of the Holy Angels at Hoar Cross, Staffordshire, and of St. Augustine at Pendlebury, near Manchester. The succeeding period of dual practice under partnership allotted most of the civil or domestic work entrusted to the firm to the almost undivided initiation and control of the junior partner, while his senior devoted himself more especially to ecclesiastical work, and to decoration. Mr. Garner was almost entirely responsible for the design and supervision of much of the firm's work at Oxford, such as St. Swithin's quadrangle at Magdalen, and the tower at Christ Church; and entirely so for the president's lodgings at Magdalen. He designed, while his partner was busy with other work, Hewell Grange, Lord Windsor's Worcestershire mansion, with all its elaborate and costly details; the well-known reredos in St. Paul's Cathedral; and several sepulchral monuments, such as those of the Bishops of

Ely, Lincoln and Chichester, and that of Canon Liddon.

Of his work subsequent to the dissolution of partnership it is sufficient to mention his rehabilitation of Yarnton Manor, Oxon., and of the Slipper Chapel at Houghton-le-Dale; Moreton House, Hampstead; the Empire Hotel at Buxton; and the crowning work of his arduous life, the beautiful chancel of Downside Abbey, near Bath, beneath whose roof his body now reposes.

Mr. Garner was of a shy and modest disposition, and less known to his contemporaries than his most unusual abilities, scholarship and attainments would have allowed a less retiring character to remain.

As an instance, however, of contemporary estimation we may state, upon the best possible authority, that when Mr. Bentley, stricken by the fatal paralytic stroke, was asked by Cardinal Vaughan what architect he would choose to carry on his work in Westminster Cathedral, he answered: "Garner, for he is a man of genius."

Mr. Garner was an admirable and rapid draughtsman, and an untiring student; he will long be remembered by his friends for his warm heart, his ardent enthusiasm, his minute and scholarly knowledge, and his unceasing energy. His long-projected book on old English manor-houses was completed for publication at the time of his death, and the first part will, we believe, be issued by Mr. B. T. Batsford in a few months.

Cement for San Francisco.—Bookings for Essex-made cement for San Francisco are so heavy that manufacturers cannot guarantee delivery of fresh orders until the end of July. The difficulty is accentuated by the fact that cement for shipment must be in casks, which the coopers cannot produce fast enough to meet the demand.

Complete List of Contracts Open.

With a few exceptions, news of Contracts Open are not repeated after they have been published once in these columns, so that readers will find particulars in our previous issues of other contracts that still remain open.

Unless expressly stated to the contrary all deposits required for bills of quantities, &c., are returned on receipt of bona-fide tenders.

The words "Fair Wages Clause" inserted in certain paragraphs signify that persons tendering must conform to a fair-wages clause in the contract, which requires them to pay the rates of wages current in the district.

BUILDING.

May 17. Caerleon.—*Extensions and alterations* to Williams' Endowed Schools, Caerleon. Tenders to be endorsed "Alterations of Schools," and delivered to L. L. Morris, Arlington Chambers, Newport, Mon., not later than 2 p.m. on May 17. Drawings and specifications may be inspected at the offices of the architects, Lansdowne & Griggs, Metropolitan Bank Chambers, Newport, Mon., and bills of quantities may be obtained there upon deposit of £1 rs.

May 18. Gwaelodygarth.—*Building a villa* at Gwaelodygarth. Plans and specification can be seen at the office of Arthur Marks, architect, Merthyr, and bills of quantities obtained on deposit of £1 rs. Sealed and endorsed tenders to be delivered not later than noon on May 18.

May 18. Runhall.—*Erection of the Primitive Methodist Chapel, Runhall.* Plan and specification can be seen at the office of A. F. Scott, 24, Castle Meadow, Norwich. Tenders to be addressed to Rev. J. H. Rose, 3, Park Road, East Dereham, endorsed "Tender for Runhall Chapel," and sent in not later than 4 p.m. on May 18.

May 18. Forres.—*Alterations and additions.* For the mason, carpenter, plumber, plasterer, slater and painter and glazier works of additions to and alterations on farm buildings at Newton of Dalvey, Forres. Plans and specifications may be seen with P. Fulton, architect, Forres. Tenders are to be lodged with John Leask, solicitor, Forres, on or before May 18.

May 18. North Tillymauld.—*Mason, carpenter and slater works* to be executed in making alterations on the farm offices at North Tillymauld. Also estimates for the mason and carpenter works to be executed in making alterations on the offices at Tillymauld Croft. Plans, specifications and general conditions for both works can be seen with the tenants or with Davidson & Garden, 12, Dee Street, Aberdeen, with whom offers are to be lodged on or before May 18.

May 18. Skene.—*Mason, carpenter and slater works* to be executed in making repairs on the stable and barn on Peter Mackie's Croft, Westhill, Skene. Plans, specifications and general conditions can be seen with the tenant or with Davidson & Garden, 12, Dee Street, Aberdeen, with whom offers are to be lodged on or before May 18.

Fair wages clause.

May 23. Skipton.—*Supply of valves, fittings, pipes and miscellaneous ironwork, required for the valve shaft, &c., of the Embay Moor Reservoir, for the U.D.C.* Drawings may be seen, and copies of the specification, form of tender and schedule of work may be obtained of the engineers, G. H. Hill & Sons, 3, Victoria Street, Westminster, and Albert Chambers, Albert Square, Manchester, on receipt of the sum of £2 2s. A limited number of sets of the drawings, uncoloured, are available, and can be lent to persons tendering on payment of the sum of £2, which will not be returned. Sealed tenders, endorsed "Tenders for Valves, Ironwork, &c., Embay Moor Reservoir," must be received by Richard Wilson, clerk to the Council, Skipton, by May 28.

May 29. London, S.W.—*Supply of ranges to working-class dwellings, for the London County Council.* Persons desiring to submit tenders may obtain the drawings, specification, form of tender and other particulars at the Architect's Department, Housing Section, 19, Charing Cross Road, W.C., upon payment to the Cashier of the Council the sum of £5. Tenders must be upon the official forms, and printed instructions contained therein must be strictly complied with. Fair wages clause. Each tender is to be delivered at the County Hall, in a sealed cover, addressed to the Clerk of the London County Council, Spring Gardens, S.W., and marked "Tender for the Supply of Ranges." No tender will be received after 10 a.m. on May 29.

(Continued on p. xiv.)

LEEDS NEW WATERWORKS.

Huge Blunders.

SOME interesting statements concerning the new Leeds waterworks appear in the "Leeds and Yorkshire Mercury," which newspaper says: "The position of affairs in the Colsterdale Valley, the site of the new reservoir of the Leeds Corporation, appears to have gone from bad to worse. As far back as last October Mr. J. H. Armitage, chairman of the Waterworks Committee, admitted that what had come to light in connection with the proposed works in that valley was 'one of the most shocking and unfortunate exposures revealed in connection with the work of any city in the country.' Mr. Armitage went on to state that, as a result of 300 mistakes in the contract drawings, a loss of several thousand pounds would be incurred, and an additional 50 acres of land would be required to satisfactorily carry out the work.

Three Alternatives.

"The most important admission, however, made by Mr. Armitage, was that it had also been proved beyond contradiction that the ganister bed upon which the embankment rested would finally outcrop 560ft. beyond the embankment, and if the embankment were made on that particular spot they would have to go down 70ft. more and spend an additional £227,000. The committee were faced with three alternatives—either to remove 1,000,000 cub. yds. of the hillside, to alter the position of the embankment, or to make the embankment twice as thick by weighting it with thousands upon thousands of tons of stones to prevent the possibility of any catastrophe. It was found that one side of the valley was slipping away; and altogether the position was such that no one had any idea what the Colsterdale works were going to cost.

"This was the position last October, when, as a result of the mistakes, it was found necessary to purchase another 50 acres of land to satisfactorily carry out the work. If, therefore, we hear of the Corporation purchasing this 50 acres, and paying as much as £150 per acre, it is natural to assume that one of the three alternatives had been decided upon—that the Corporation had determined to stick to their original site, and deal with the outcrop by going 70ft. farther down, and

Spending an Additional £227,000.

"We understand on excellent authority that the Corporation entered into negotiation for the purchase of an additional 50 acres of land, but within a few days of handing over the purchase money suddenly found that it would be folly to build their dam on the original site, and decided to go to Parliament in November for new powers. . . . Originally, nearly 400 acres of land were purchased in the Colsterdale Valley. After the purchase of other 50 at £150 an acre, 250 acres will be absolutely useless for reservoir purposes . . ."

The Present Position.

Mr. Armitage, when seen by a representative of the "Mercury" said: "Since the serious defects were discovered we have been sinking a series of trial holes in every direction, and at the request of the new waterworks engineer (Mr. Henzell), Mr. Henry Rofe, of Westminster, was called in to consult with him. The trial holes are just nearing completion, and the engineers have practically the whole of the information now in their possession, which will enable them to report to the committee and advise. The Waterworks Committee is expecting their report very shortly."

It will be interesting to see what the engineers recommend. In any case it would seem that the blunders made in the past will incur thousands of pounds extra cost.

THE CRAFTSMAN IN FRANCE.

WRITING in the "Architectural Record" of New York in connection with a portfolio of plates illustrating some modern interiors in France, Mr. Russell Sturgis, the well-known critic, makes some interesting remarks about the French craftsman. It is not to be denied, he says, that the skilled and practised workman is much more in evidence in France than in American cities. "No one who has tried to have decorative work done in Europe, he being on the spot himself to look after it, but will remember his surprise at the facility with which the very first cabinet-maker or stone-cutter that he talks with sees his meaning and is prepared to meet him half way. What does this mean? It means tradition! It means the result on the present generation of the workmanlike habits which existed in many previous generations.

The French carver

can do nothing except in the recognized styles, but he knows those styles in a wonderful way; and when he learns from your remarks or from your preliminary sketches that you mean something in the way of *Louis Treize*, let us say, he is prepared to block out in soft wood friezes and panels quite in harmony with what he takes to be your purpose, and of surprising value to you in your attempts to make up an important piece of decorative joiner-work to refresh your sculpture.

"So in the matter of pure sculpture in material other than wood, it makes little difference to the working sculptor whom you consult whether he is asked to employ one assistant and one set of tools, and with them to work in soft stone of the Paris basin, or whether with other workmen and quite other tools he is to produce something in hard plastering—in stucco or pure gypsum. In either case he will 'meet you half way,' as has been said before. His readiness and his knowledge are of evident assistance to the designer of the whole work, who is not driven to the wretched habit of drawing everything out to scale and also to full size before he even talks to a workman about the putting of the whole in hand.

French Stonework.

"There is done in Paris, and in the other towns which are built up with the soft cream-white material which we call Caen stone, almost the only modern work in great solid blocks set one upon another in Greek simplicity of process. The Paris workman does use mortar—in that respect he has abandoned his Greek exemplar—but he cuts his blocks straight in four ways and builds piers of them, or he cuts them with two faces, two beds and two vertical joints, and lays each block facing out and in. He is not afraid of the dampness of out-of-door weather; he is not wild for furring and hollow walls; he seems to find that the stone block weathers on the outside and preserves its interior mass and its inner face very well, without extra precautions."

OUR PLATE.

Burrough Court, Leicestershire.

THIS house with the stabling and cottages is approaching completion for H. C. Allfrey, Esq., on a fine site about half a mile from John O'Gaunts station. The walls are of brick, covered externally with cement harling. The base is of Ketton stone, which is also sparingly used for footstones, chimney caps, &c. The roofs are covered with Colley-weston stone slating, and the windows have metal casements and leaded glazing. Internally the house is simply treated, it being intended to panel some of the walls when quite dry. The general contractors are Messrs. Herbert & Sons, of Leicester, Mr. W. J. Vinnell being the clerk of works. The architect is Mr. Walter H. Brierley, F.S.A., of York.

Correspondence.

The Architectural Draughtsman.

To the Editor of THE BUILDERS' JOURNAL.

SIR,—Referring to the letter from "Architectural Draughtsman" which appeared in your columns a short time ago in respect to the heartrending actions of pupils in architects' offices on plans on which the draughtsman has spent hours of labour, your readers will doubtless be interested to hear of a pupil who was given a plan of an estate to finish off. He had to put trees in several of the fields, and by mistake he put some in the wrong field; so, quite seriously, he drew an arrow from the middle of them into the right field, and then carefully printed thereon: "These trees should be in the next field."—

Yours faithfully,

CHARD.

A DRAUGHTSMAN.
